THE
JOURNAL OF HORTICULTURE,
COTTAGE GARDENER,
COUNTRY GENTLEMAN,
BEE-KEEPER, AND POULTRY CHRONICLE.

A JOURNAL OF GARDENING, RURAL AND DOMESTIC ECONOMY, BOTANY, AND NATURAL HISTORY.

CONDUCTED BY

GEORGE W. JOHNSON, F.R.H.S., AND ROBERT HOGG, LL.D.

THE FRUIT AND KITCHEN GARDENS, by Mr. J. Robson, Gardener to Viscount Holmesdale, M.P., Linton Park; and Mr. E. Lunckhurst, Old Lands, Buxted, Sussex.

THE FLOWER GARDEN, by Mr. G. Abbey; "Ayrshire Gardener;" and Mr. T. Record, Gardener to the Marquis of Salisbury, Hatfield House.

STOVE, GREENHOUSE, and WINDOW GARDEN, by Mr. R. Fish, Gardener, Putteridge Bury, near Luton.

FLORISTS' FLOWERS AND FLORICULTURE, by the Rev. H. H. Dembrain.

GARDENING CALENDAR, by Mr. William Keane.

POULTRY-KEEPING, by Mr. J. Bally; E. Hewitt, Esq.; and L. Wright, Esq.

PIGEONS, AVIARY BIRDS, &c., by "Wiltshire Rector;" W. A. Blakston, Esq., and others.

BEE-KEEPING, by T. W. Woodbury, Esq.; "B. & W.;" and Mr. S. Bevan Fox.

HOUSEHOLD ARTS, by the Authoress of "My Flowers," and others.

VOLUME XIX., NEW SERIES.

VOL. XLIV., OLD SERIES.

LONDON:

PUBLISHED FOR THE PROPRIETORS, 171, FLEET STREET.

1870.

LONDON :

PRINTED AT THE JOURNAL OF HORTICULTURE OFFICE,
171, FLEET STREET.

TO OUR READERS.

THE pen had been dipped into the ink and we were hesitating how to commence our customary address, when the mournful cry of "Poor frozen-out Gardeners" reached us from the street. We looked out upon those thus wailing, but felt no pity for them—they were unmistakeable impostors. The words "Frozen out," however, have summoned up many thoughts—thoughts of the plants and of their cultivators "frozen out" by the war-ravages now desolating France—thoughts of the wise forecast of those gardeners who reserved in-door employment for such times as these, when from out-door employment they are "frozen out"—thoughts of the "bonny blithe blink of their ain fireside," by which many a gardener, many a fancier of the pets within this Journal's province, has that fireside made more cheery by our pages. This last thought adds to our cheeriness, for there is no brighter pleasure than that beaming from a knowledge that we make others happier. That our pages do effect that, our hope and purpose, is no vain suggestion of self-complacency.

We have the testimony before us in many letters, and those letters justify the still higher gratification arising from a certainty that we benefit as well as please. We could extract from many letters bearing this testimony, but a brief one must suffice—the letter is from a well-established seedsman and florist. "It may perhaps amuse you when I say that some years ago, when I was farming our own estate, a friend lent me a bound volume of your Journal, the reading of which had the effect of turning me into a florist, and I believe, had it not been for that, I should never have entered into this line of business, though always passionately fond of flowers." Such certificates that we minister something to the happiness and advantage of others makes our fireside blink more bonniely; but it does not make us forget that the good we thus achieve is due chiefly to the kindly hearts, able heads, and ready pens which are combined to enrich our pages. That combination will be continued and strengthened. This, we confidently hope, will secure to us your continued support, and then certainly we shall not be "Frozen out."

INDEX.

- AREXAS GROSSULARIATA**, 516
Achmenes, culture, 519; propagation, 51
Actinia, the Strawberry, 413
Achyranthes, 316
Adiantum, Feet, 210; pedatum, 69
Acapantius treatment, 815
Acazorus procerus, 328
Albborough Poultry Show, 153
Algarian gardening, 290
Alamanda violacea and culture, 357
Allerton Poultry Show, 111
Alternanthera Lindenii, propagating, 278
Aiton Towers, 287, 307
Amateur, or Florist? 51; gardener, the, 26, 163, 245
American blight, 334, 337
American winter garden, 812
Amorphophallus bulbiferus culture, 364
Anagochilus Dawsonianus sickly, 273
Andalusians, 329
Angeles, winter-blooming, 306
Annals, for autumn sowing, 192; for greenhouse, 315
Anomatheca areolata, 128
Anthomus pomorum, 413
Anthurium ornatum, 26; Scherzerianum, temperature for, and propagating, 16
Antipodes, gardening at the, 810
Antirrhinum, list of, 171
Ants, driving away, 108; to destroy, 135; in dwelling-house, 218

From observations taken near London during the last forty-three years, the average day temperature of the week is 74.8°, and its night temperature 50.4°. The greatest heat was 92°, on the 7th, 1852; and the lowest cold 33°, on the 9th, 1863. The greatest fall of rain was 1.10 inch.

FORMING A FLOWER GARDEN.—No. 1.

THE SITE.

NATURE, amidst all the lavish wealth and marvellous variety of form and colour which she has spread around us, would appear to have attained her culminating point in the blossom of flowers. The stately timber trees, with all the dignity which their colossal proportions impart, are not so attractive, although we love to watch their storm-tossed boughs, to listen to the wind rushing through the sturdy limbs of the "brave old Oaks"

with a noise like thunder, or sighing in gentle measures among the sombre Pines, or whispering in gentlest zephyrs among the sensitive leaves of the Aspen. All these varied phases of nature influence us, and we cannot wonder at the superstitious awe and worship which the huge forms and mystic voices inspired in the earlier ages of the world, when our rude forefathers imagined they heard the voices of their gods speaking to them in wrath as they came riding on the wings of the storm, or in the more gentle accents of peace and forgiveness in periods of calm.

The elegant form of the feathery Pinus, the glossy sheen of the Laurel, the graceful Fern fronds, and a thousand other rare gems of the vegetable kingdom—all these excite our interest and command our admiration; but to none of them do we yield such entire, such hearty homage as to the flowers—the beautiful flowers. From the Rose in all her regal beauty, down to the pale Primrose or humble Violet, we love them all; in whatever form they are presented to our gaze they are always welcome. But while we admire and fully appreciate the skilfully arranged bouquet of cut flowers, or the high finish of symmetrical pot plants, it is to the parterre that we constantly return with never-ceasing interest and enjoyment; for there we find a multitude of charms, a lovely combination; earth, air, and sky all uniting to add to our pleasure. Animated nature is around us, the song of birds, the hum of insects, the bright-winged butterflies sipping rich nectar as they flit from flower to flower; the soft blue summer's sky, chequered perchance by fleecy clouds sailing lazily along—all these are there to influence and add to our enjoyment of the rich scene displayed before us. The flowers, too, present themselves in a variety of guises—in the early morning their dewy bright-coloured petals glistening in the rising sun, and at midday their gorgeous colours seeming to reflect the brightness of the sun; but in the evening, when the calm still twilight comes "stealing o'er the scene," the flower masses are most beautiful in the soft subdued light, the colours appearing to deepen and grow more lovely each moment.

Granting, then, that all this enjoyment, and very much more, may be derived from a flower garden, it is, of course, intended to imply that for it to possess such attractions, for it to become such a constant source of enjoyment all through the summer months, there are certain important points to be attended to, certain fundamental laws which cannot be broken with impunity; for if they be not strictly observed it will be vain to expect anything but disappoint-

ment and failure, no matter how neat or trim may be the keeping, or how fine and abundant the supply of plants.

In the formation and management of a flower garden the chief things necessary to be taken into consideration are the site, the design, the plants and their arrangement, and the accessories or surrounding features.

Individual taste has very much influence as regards the selection of the site of a flower garden, some preferring to have the flowers near the house, where they may be seen from the windows; while others would rather have the flower garden away in the grounds, a distinct and separate feature; and others, again, adopt a middle course, and just break the monotony of the green turf by introducing a few groups of flowers to brighten the scene without having the great bulk of flowers constantly visible. All three methods are alike commendable and useful, for it is very rarely that the same plan or mode of proceeding can be adopted in different places.

In choosing the site, therefore, the principal features of the pleasure grounds must be surveyed before a just decision can be arrived at. In villa gardens and all small places it is, as a rule, best not to fix upon any particular spot whereon to display a formal design, but to introduce an occasional bed, or group of beds, in such a manner amongst the shrubs, that although each group may be complete in itself, it may also form a connecting link with the next, and thus tend to produce a harmonious whole. Great contrasts in small places are not pleasing. This method of arrangement is best adapted to a lawn that sweeps in a semicircular form around two sides of the house, and if the lawn is enclosed and sheltered by a belt of shrubs, a walk winding among them and leading to some retired spot occupied by a fernery, will afford an agreeable promenade in the heat of summer, while the shade of the overhanging trees and the lively green and elegant forms of the Ferns will be alike attractive. A collection of healthy thriving Ferns is always interesting, and placed at the end of such a walk it would impart a grace and a meaning that nothing else could supply; it would give a charm to, and enliven, that which would otherwise be void of interest. Moreover, the Ferns would be more likely to thrive in such a position than they would be if more exposed to the sun. How frequently does this appear to be forgotten! Ferns are planted in all sorts of incongruous positions, where, tenacious of life, they linger, and put forth a few weak fronds. I have actually seen them planted on a heap formed of roots and earth standing boldly out on an open lawn!

In places of greater extent having three or four acres of lawns and pleasure grounds, a regular design may be readily introduced, and made to form an important and striking feature. Whether it will appear best near the windows of the house or away among the shrubs, must, as I have before observed, always remain a matter for individual taste to decide. If the lawn slopes gently from the mansion, and has its surface skilfully diversified by a few handsome specimens of choice shrubs so placed as to agreeably relieve without marring its expansiveness, then I think the flower garden would be far more enjoyable if away from the house in some open yet retired spot in

the shrubbery. A well-kept lawn clothed in nature's "livery of green" is always an agreeable object, soothing to the eye, and refreshing to look upon, and is a striking and important feature peculiar to the climate of our temperate zone; the flower garden in the shrubbery forms an object for a stroll, and not being constantly seen, its charms retain their freshness and attractiveness throughout the season. But if the mansion stands on a very elevated position, a terrace garden is a very appropriate and beautiful object, imparting an air of dignity and grandeur by its ample breadth, its massive colouring, and its accessories of balustrades, vases, and flights of stone steps. In forming a terrace, care should be taken to have it in good proportion to the mansion, nothing can possibly be in worse taste than a lofty imposing structure, with a narrow formal terrace garden crowded with flowers; the terrace should therefore have breadth in proportion to the height of the building it is near; and the flowers, which should be well away from the house, produce the best effect in such a position if disposed in large bold masses. A broad raised terrace walk parallel to the side of the mansion, and overlooking the flowers and the scenery beyond, forms a delightful and appropriate promenade.—EDWARD LUCKENST, *Egerton House Gardens, Kent.*

A FEW VARIETIES OF CHERRY PYRAMIDALLY TRAINED.

I HAVE several sorts of Cherries trained in the pyramidal form worked on the Mahaleb stock, and growing in a deeply-trenched, heavy, and moderately-rich loam, formerly pasture land, with a liberal mixture of brick and mortar rubbish, and a little rotten manure added. The trees were planted five years ago, and were then a good sample selected from a well-known nurseryman's stock; they have therefore arrived at a stage at which a person may easily judge of their merits, or otherwise, for this mode of training. As most of the trees have succeeded well, it may be a little guide to intending planters next autumn if I name all the sorts I grow, and give a brief description of their qualities, whether favourable or otherwise.

Adam's Crown is the first. It is a medium-sized early fruit for table use; the tree is a moderate bearer, and not a vigorous grower, but it makes a very handsome and compact pyramid.

Belle de Choisy.—A large-sized, mid-season fruit for table use; it is a moderate bearer and vigorous grower, and makes a fine tree. The fruit is very handsome.

Belle d'Orléans.—One of the best and earliest Cherries for table use; it is of good size and flavour; both in growth and productiveness it is first-rate.

Archduke.—One of the best bearers, early, and of good flavour; thin-skinned and fleshy, a good fruit for either table or kitchen use. Makes a handsome tree.

Late Duke.—A well-known and desirable Cherry for the table; large and very prolific. The growth is moderately vigorous, and it makes a pretty tree; it is generally late, coming in for use in August, but this year it promises to be earlier.

Elton.—A large, fleshy, and richly-flavoured midseason Cherry for table use. As a pyramid, it does not bear so well as some others, but it makes a good tree.

Napoléon.—Like the last named it is a sort of Bigarreau. The tree is an abundant bearer, producing large fruit of excellent flavour, which comes in about the beginning of August. It is of vigorous growth, but is not so compact as some others; it soon makes a large tree.

Circassian [Black Tartarian].—A very early, excellent-flavoured black Cherry for table use; it is in all respects a first-rate and desirable sort.

Précoce de Lyon.—This is a bad grower with me; it cankers and dies off. The tree has never ripened a fruit, so I cannot speak of the quality.

May Duke.—A well-known prolific Cherry. It succeeds extremely well as a pyramid, and is excellent in every other way. It comes in early for the dessert.

Baumann's May.—A fair-sized black Cherry for kitchen or table use. The tree is a vigorous grower and prolific. Skin of fruit thin and fleshy.

Montmorency.—The trees are moderately vigorous, with a compact habit of growth and dark green foliage; they have hitherto been shy bearers as pyramids, but the few fruit they have borne look very like an inferior sort of Morello. The fruit is late, and has an acid flavour; the trees were not until this season in a healthy state, which may account for their scanty

produce. However, the numerous fruiting spurs they are making show signs of cropping in future.

The *Flemish Cherry* makes an excellent pyramid, but it only bears sparingly. Being a late Cherry, it is worth growing for tarts or preserving; it bears a large red fruit inferior to the Morello.

Governor Wood.—This is a delicious Cherry, large and fleshy; it bears abundantly on walls, and as a pyramid it is not inferior to any of the varieties previously noticed; it is a dessert fruit.

Morello.—This is the last I have to mention; it is not often seen growing as a pyramid, but it makes the handsomest tree of any I have named, and the fruit in yield, size, and flavour is much superior to that produced by trees upon a north wall. As this Cherry differs from all others in its habit of growth, and produces its fruit upon the last year's wood instead of upon spurs, as in other varieties, a different course of treatment must be adopted for this mode of training. Very many of the shoots have only one wood bud, and that at the extremity of the shoot. If that is shortened in winter, as in other trees, the fruit is useless, and the shoot dies because it makes no foliage or wood. To obviate this a judicious system of summer pinching the young shoots must be pursued; there will then be plenty of flower buds close together, and plenty of wood buds to maintain the symmetry of the trees. The only winter pruning required will be a little thinning of the shoots to balance the action of the sap.

It is a common remark this year, that the Cherries are very much smaller than usual; this is probably owing to the dry season. We have not had more than one shower in the immediate locality since last March, although two or three miles from us frequent showers have fallen.—THOMAS RECORD, *Lillesden.*

EARLY VERSUS LATE PLANTING RIBBON BORDERS.

MR. FISH, in "Doings of the Last Week," having invited me to describe the mode of planting adopted in our large bed this season, I somewhat reluctantly do so, as circumstances led me to adopt a plan so widely different from that which he advocates, and that which, for many reasons, I would like to be able to follow. Our respective modes of operation have so little in common, that in giving a rough outline of our procedure here, I run the risk of being found fault with by almost all who have such work to do; but there may be some who may be under the necessity of adopting a plan somewhat similar, and although we are, I hope, for the well-being of flower gardening as a feature of rural embellishment, in the minority, there is no just cause or impediment why our voices should not be heard. Besides, there are, no doubt, many who will be in some measure consoled when they find that others are compelled to do as they do.

Mr. Fish throughout the long series of letters which are read with so much relish by the public, advocates late planting, and the oft-repeated warning, "wait," is without question, a prudent one. On the other hand, we practise early planting, not in every instance because it is the best, but because circumstances in a certain degree compel us to do so, and a few words on the cause of this may not be without interest. In the first place, I may explain that we suffer from want of space, and although I know how well Mr. Fish economises both that and water, yet we could not by any amount of crowding give a separate position to half the plants required here for bedding. Our flower beds have multiplied so much faster than the structures capable of accommodating plants, that we are under the necessity of planting out the majority of those for bedding direct from the cutting pans or boxes, with the exception of such subjects as are considered more choice than the rest. These are indulged with separate pots, or cared for in some other way. To make this more clear, I may mention that in addition to the large bed to which Mr. Fish alludes, and which has been often described in these pages, we have two ribbon borders, each 593 feet long, and 10 feet wide, occupying a space of more than a quarter of an acre, or equivalent to upwards of 150 circular beds, each 10 feet in diameter. It will be easily conceived that a very considerable space must be required as standing room for plants to fill these borders alone, and not having accommodation for so many we plant out many things much earlier than our neighbours, with results not always unfavourable to early planting.

To give an idea of the way we commenced planting, I may

explain that the two long borders, bounded by turf, with a broad gravel walk between them, are intersected in the middle by another walk. The loss, however, occasioned by this cross walk is not included in the measurement given above, which is simply the united length; but it will be seen that this break affords an opportunity of introducing another variety of plant, when, perhaps, there is not sufficient of one kind to make up the whole, for instance, two or more varieties of Scarlet Pelargonium or Yellow Calceolaria may be used without offence, and it is often advantageous to compare the respective merits of each kind, and when they are planted under circumstances of perfect equality, and in sufficient numbers, their general qualifications are better ascertained than from only a trial plant or two. In the case of these long borders the numbers are generally such as to show differences in mass which cannot well be distinguished in single specimens. The eye on scanning a line of 100 yards or more of the blooms of one plant is better able to discover wherein the tint of the bloom differs from that of an adjoining one, than when the comparison is made between single specimens. As a test ground, the large scale has unquestionably many advantages. The merits of a Pelargonium are generally pretty well known before it is propagated to the extent of several hundreds; still, every season brings out fresh features, or it may be different features, in each variety, so that the estimate formed of it at one time is not unlikely to be reversed at another; the experience of a series of years also enables one to weed out the indifferent kinds. I know there is an unwillingness to part with an old friend which has done good service, and yet I did so with Tom Thumb some years ago.

Omitting all notice for the present of the manner in which one large bed is planted, I will confine myself to the long ribbon borders, as they have their representatives in so many gardens. I again repeat here what I have often before stated, that I am no advocate for a great diversity of plants being used, or rather I should say, I do not approve of many distinctions in colour. Half a dozen kinds of Scarlet Pelargoniums may be all planted together without an ordinary observer noticing their differences, but pink and salmon-coloured varieties would alter the affair. Further, in ribbon-border planting, I prefer a broad band of one colour or kind of plant to very narrow lines, unless the view is confined to the end only, which happens but rarely; therefore, in most cases where flowering plants form one of the lines, I prefer to have the line broad, as few flowering plants form an unbroken line when planted in a single row and inspected at right angles to that row. Endwise most plants will do. Lobelias, Nierembergias, and Calceolarias, are about the best, but Pelargoniums seldom fill in well enough to please me; besides, a good breadth of colour shows more richness than when the space is cut up into two or three divisions. On this account I have in the present season returned with some deviations to a plan of four or five years ago, in the planting of these borders, and its simplicity is one of its best recommendations. Although the appearance is anything but inviting at the time I write (the beginning of June), the description will enable anyone to conceive what it ought to be when further advanced. These borders are straight, and with the broad walk between them, point towards the mansion, or rather from thence to another important object. As they stand clear of all shrubs or other objects, and can be inspected from the back as well as from the walk side, it has always been my custom to make both sides of each border alike, also each border like its fellow. This reduces the variety of plants used to a small number, and I do not think it is necessary to increase it; on the contrary, it would assuredly impair the effect. When planted in plain stripes we have rarely used more than four kinds of plants, and I believe on one occasion only three, including the edging plant. This season we have four, and they are of the simplest and most common kinds, yet I believe the effect will be satisfactory. The borders being 10 feet wide, we have always had ten or more rows of plants in them, and this season that number is adopted. Although one of the kinds of plants used does not confine itself to a limited space, the others are more compact. The borders have been planted thus:—An edging of *Cerastium*, followed by a band about 2½ feet wide of *Verbena pulchella*, then a single row of yellow Calceolarias; two rows of Scarlet Pelargoniums form the centre of each border; then a single row of Calceolaria, a band of *Verbena pulchella*, and the *Cerastium* as before, the whole occupying the 10-foot space. If the weather be not too dry for the Calceolaria, I expect the whole will look well when in perfection.

Now, with regard to early *versus* late planting, I expect Mr. Fish and most others will be "down upon" me for commencing so soon, yet I must not falter in telling my tale. Well, then, what do the readers of THE JOURNAL OF HORTICULTURE think of my commencing planting out on April 14th? and the Calceolarias planted that day, and on the 16th, are certainly the best we have at the present time, although they received no help or protection of any kind, being merely watered the day they were planted, and never afterwards. The weather, however, being exceedingly dry at the time, planting was discontinued after the 18th, for a week or more, but on the 29th and 30th of April, the *Verbena* was planted, the planting of the Calceolarias having been finished in the interval. On April 30th about four hundred Pelargoniums were planted out, and no protection of any kind given. The frosts that followed on May 3rd and 4th, of course stopped the planting of tender plants, and the Pelargoniums suffered, but none were killed, and now they are not the least promising of the Pelargoniums we have bedded out.

The above is, no doubt, an extreme case, and I do not state it with the view of encouraging early planting, but under circumstances similar to those under which we were placed, early planting may be adopted in preference to the plants' suffering from confinement in their winter quarters. It must not be supposed that we are exempt from the evils of frosty nights and cold easterly winds, for on the night of May 2—3 I put a basin with water in it upon a grass plot near my cottage overnight, and the next morning it was so frozen that the basin could be turned upside down without the water running out, and on the next night the frost was about the same. It was, however, the extreme dryness which enabled plants to withstand the cold, and these Pelargoniums did so. I hope at some future time to report their condition as compared with the same kind planted later, for although these were planted in April, we did not finish planting out Pelargoniums till June 4th. The other conditions, however, relative to planting are of so conflicting a nature, especially with regard to Pelargoniums, that they cannot well be all explained in one paper; but in a subsequent one I hope to enter more fully into the causes which sometimes render early planting preferable to waiting so late as usual.—J. ROBINSON.

(To be continued.)

PRUNING ORNAMENTAL TREES AND SHRUBS.

No. 3.

Section II.—In this section we have trees of a different type from those in Section I., for, unlike the latter, the leaders may be more than one, and yet the form essential to a good specimen will be preserved, whether the form of the tree is conical as with the Chinese Juniper, or spreading as with the Hemlock Spruce and common Yew. They also differ from Section I. in this respect—good specimens may be obtained from cuttings or layers, and grafts; but there is no question that the healthiest, freest in growth, and best-formed are trees raised from seed. Such in all cases are to be preferred to those from cuttings and grafts. Indeed, some of them so propagated are not suitable for single specimens, as the *Cupressus Lambertiana* (macrocarpa), *C. Lawsoniana*—I know cuttings root freely enough, but we expect something more than a bush from this graceful tree—all the genus *Taxus* when practicable, *Thuja gigantea*, *T. Lobbi*, *T. occidentalis*, and *T. orientalis*.

The trees or shrubs constituting this section are in habit erect or conical, spreading or diffuse, a few being pendulous, and one or two are procumbent. Of those which are erect, conical, or pyramidal in habit I may name *Chamaecyparis sphaeroidea*, *C. thurifera*; *Cupressus Lambertiana*, *C. Lawsoniana*; *Juniperus chinensis*, *J. communis*, *J. hibernica*, *J. virginiana* (Red Cedar); *Retinospora pisifera*, *R. plumosa*, *R. obtusa*; *Taxodium distichum*, and its variety *fastigiatum*, the type of an upright-growing tree; *Taxus adpressa*, *T. adpressa stricta*, *T. baccata pyramidalis*, *T. elegantissima*, *T. erecta*, *T. fastigiatata*; *Thujaopsis borealis*; *Thuja gigantea*, *T. Lobbi*, *T. occidentalis*, *T. plicata* and var. *Warreana*, *T. orientalis* and var. *elegantissima* and *stricta*.

The spreading are *Abies canadensis*, *A. Albertiana*, *Taxus baccata* and its variety *fructu-luteo*, *T. Washingtoni*, and *Thujaopsis dolabrata*.

The pendulous are represented by *Cupressus funebris* (not hardy, or only so in warm sheltered situations), *Taxus Dovastoni*, and *Thujaopsis Standishii*.

The trailing are represented by *Juniperus prostrata*.

In proceeding to prune the conical or pyramidal-habited kinds, it will be necessary to keep a strict eye on the upper part of the plant, for, as not infrequently happens, there may be a number of upright shoots that start from a part almost parallel with the leader. These must be shortened so that greater vigour may be thrown into the leader, in order that it may preserve its superiority. Indeed, it is of great importance that the tree be kept to one leader, for if more than one be allowed, the subject, though the pyramidal form may for a time be secured, will ultimately open, and have anything but a good appearance. Tying the branches together is but a bad remedy for open tops or heads. This evil might be prevented by beginning in time with the pruning knife. What I advise is keeping all trees to one leader by cutting back each of the side shoots as, from their strength, are likely to interfere with the leading shoot, the leaders of all such shoots being taken off to some of the smaller ramifications at the base, which will be necessary for clothing the stem and to give extension outwards.

Sometimes strong shoots arise from various parts of the tree; they can only cause an irregularity in the growth, and should be cut back so as to preserve the required form, and yet the pruning must be of such a nature that the branch operated on will be weakened, and the sap it had before appropriated be diverted from it to the weaker parts of the tree. In pruning to stop excessive vigour in any part, the strongest and longest parts must be those removed, for the channels being wider, the sap flows more freely into them; therefore when they are removed the sap does not enter the smaller shoots in any greater quantity, or but slightly so, than when the strong parts are present; hence a quantity of sap is liberated that must find its way to other parts of the tree, and the subject is not slow in meeting this supply by putting out fresh shoots, or those already in existence receive a greater amount of support, consequently are invigorated. In like manner the weak and thin sides or parts of a tree may be rendered stronger by thinning out and shortening the strong shoots; and when this is the object the pruning should be done when the plants have commenced growth and are somewhat advanced; then the sap will be appropriated by the parts growing and not pruned.

It not uncommonly occurs that trees of some kinds will have a sort of divided leader, two three, or more shoots starting from one point, and none taking a direction well calculated to form a good leader. In cases of this kind one of the most vigorous and upright shoots must receive every encouragement, by the upright growths of the others being cut off, but leaving a sufficient number of the side shoots from them for furnishing the tree in that part. If the leader cannot be reduced to one without making an opening on one side, or causing a deviation from the upright direction, it is better to have more than one leader, if it be only for a time; that ultimately intended to have the sole leadership being encouraged by cutting away such parts of the others as can be dispensed with without injury to the rest of the tree, always keeping in view the symmetry and character of the subject.

In some cases two, three, or more leaders have been formed, and the tree, allowed to attain a considerable height and size, has already begun to open at the top. This is very commonly the case with the Arbor-Vitæ. Little can be done in cases of this kind: but by thinning-out the shoots where they are very close together, without making the tree too open, the growth of the latter may be increased in the direction of parts that are open. In a like manner the height of the tree may be added to by thinning-out the heavy upper parts, and this being done after the tree has commenced growth, the lower branches, which are seldom so strong as the upper branches, will receive greater support and become more vigorous. It is well in all cases to secure as nearly as can be equal vigour in every part of the tree. It will be attained by thinning-out the strongest parts when growth has begun, and not interfering with the weak. Loose, long, or irregular growths should be cut closely in, but this must be done before they become old, or ugly gaps will be formed, which it may not be practicable for a long time to fill.

The spreading-growing trees require pruning of an entirely different kind. It is well if they can be kept to one leader, and as that may be done until the trees are of considerable size, it is advisable to remove all the leaders but one; and any branches that take an upright course, and are on that account likely to attract more than their share of the sap and so become excessively vigorous, should be cut clean away; or where that cannot be done without making an opening, cut off the

extremity of the upright-growing branch to where more horizontal branches diverge.

The pruning of the spreading kinds of trees, indeed of all trees, must be done in such a manner that no one can tell in the course of a year or two that the pruning-knife or saw has been used. This can only be effected by cutting close to another shoot or branch, which, though not intended to take the place of the first one, will give all the appearance of a close growth at that part. If this cannot be done the pruning has been deferred too long, and is much better left alone. How often do we see trees divested of great limbs, making gaps which no succeeding growth will fill up; the lower branches cut off without any regard to clothing the trunk; and strong branches shortened so as to leave nothing but a naked part, often several feet in length, from which no shoots are produced in some kinds of trees, whilst in others is produced a tuft of strong shoots which take an upright direction, and are a greater eyesore than the parts first removed. Such is not pruning but maltreatment.

Some of the spreading kinds make excellent close pyramids, bushes, or hedges, the Yew being the best of all for these purposes. It submits to pruning better than any other tree, and may be cut at any age or size, and it will push again from every part. On that account it is much in request where a close verdant screen is required, and also for gardens where bushes of evergreens are required not to exceed a certain size, and to be kept of a certain form. The pruning of such subjects is best done in spring before growth takes place. Whether little or much cutting-back is required, there can be no question that spring is the best time, as there is then every chance of good growth and closeness of foliage; besides, the subjects have a more feathery appearance than when the pruning is performed after the growths are completed, and if any irregular growths are made it is easy to remove them after that time. If a close wall-like screen be wanted, of course the cutting must be done after the growth is complete, or in July.

The American and Chinese Arbor-Vitæ are also used for screens. I think they are best cut-in during the spring, as we then secure the foliage of the year, instead of allowing it to be produced and then cutting off the greater part of it. The Irish Yew also makes a good screen, and needs very little trimming; it is of such dense growth, that no other pruning than that of the knife is wanted. Its only drawback is that when of good size the upper part has a tendency to open, but that may be remedied by not allowing the side shoots to grow more than a few inches before they are shortened. This attended to, it makes one of the very best screens, and requires little care. The Irish Yew, it should here be stated, though it grows upright, ought not to be trained as a cone or pyramid; that cannot be done without pursuing a system of pruning that must very much limit the proportions of the tree and make it narrow and formal, therefore the branches may open, and each will be feathered throughout its length. Irregularities of growth will, of course, need to be cut out, a good specimen being the object in view, and this secured, the trees will be quite a feature from their fastigate character. Tied-in as the branches sometimes are, the trees may serve for a time. As cones of 6 or more feet in height, the Irish Yew is unequalled; but if it is intended to show at any future time in character, the tying only destroys the small twigs that would form on the upright branches, and these are consequently bare in the centre.—G. ABBEX.

OPENING GARDENS TO THE PUBLIC.

It singularly happens that I have been frequently on the point of writing to THE JOURNAL OF HORTICULTURE, holding forth the gardens of Elvaston Castle as an example to the way in which such gardens should be opened to the public; for, some years ago, I went with some friends, during the life of the late Lord Harrington, to see these celebrated evergreens, and we were then admitted by printed tickets—I think the price was 2s. 6d. to admit a party of four—the produce of which was appropriated to the support of the Derby Infirmary; “no fee to be given to the gardener.” If such a plan were adopted at such places as Chatsworth, Trentham, and Enville, and special days of the week appointed, what an excellent arrangement it would be. Valuable charities would be supported, visitors would know exactly what they had to pay, and neither the privacy of the owner nor the business of the gardener would be interrupted on the other days. The arrangements might be made known to the inn-keepers in the neighbourhood, and

the information would soon spread among those interested in such places. The charge for a single admission might be 1s., and for cards admitting four persons 2s. 6d.; the expenses of the men to show visitors over the grounds to be deducted from the general receipts, and the men to be strictly prohibited from receiving gratuities.—Hortator.

LUXURIANT FOLIAGE, BUT NO FRUIT.

"In the winter of 1865-6 you supplied me with a number of pyramid fruit trees—Apples, Pears, and Plums, as well as Currants. These have, with the exception of a few of the Pear trees, thriven grandly as far as wood and foliage go; but we obtain scarcely any fruit. Last year we had a few Apples (Domino and Warner's King), and about half a dozen Pears of various sorts. Not a Plum has yet formed. Again, this year there are some Dominos, and a very few of other sorts, but no Pears. The trees have been carefully treated—planted, pruned, &c., in accordance with the instructions given in Rivers's 'Miniature Fruit Garden'—a good authority, I presume.

"The soil is a fair loam, on deep gravel and rubble. The situation high, yet sheltered, and being high and on gravel, the garden is very much parched in long droughts like the present. This affects Strawberries and many flowers, which need diligent watering. All kinds of fruit trees and bushes, however, thrive in growth, while they bear little or no fruit. This is, perhaps, more strikingly the case with Raspberries than with any other. The canes are each year most vigorous, the foliage luxuriant and fresh throughout the season, and the show of blossom magnificent. The blossoms, however, prove universally blind, and never set. Can you suggest where the fault lies? Is it likely that the situation is too dry? But, if so, would not the foliage tell the same tale?

"I have some thoughts of removing the fruit trees to another garden in a lower situation, where the loam is somewhat deeper and the subsoil less porous. In this lower garden vegetables, to which at present it is exclusively devoted, are grown with good success. May I hope to find advantage in this removal? It is not intended purely for the sake of the fruit trees, but with a view to adding the ground to the lawn and flower garden.—E. H."

The above letter, just received, describes in forcible language the state of many gardens and individual fruit trees—trees and plants growing luxuriantly, and bearing little or no fruit. I believe, in the majority of cases, keeping the land loose by digging and forking is the cause of failure.

Some years since I was sent for by a gentleman to inspect his Peach trees (standards planted out in a border of his orchard house), which he told me always cast their fruit. No trees could look better; they were as clean and healthy as could be wished. After asking his gardener all the questions I could think of as to the management, and receiving satisfactory replies, I all at once thought of the soil, stamping upon which with my heel I found it almost as light as a feather bed. "How is this?" I asked, knowing the gardener had often been to see my trees, and that he knew the borders had never been disturbed since the houses were built. "Oh," he said, "Mrs. — will have winter salads grown here." "Give my compliments then," I replied, "and say she must not expect Peaches." The border was made solid and kept so, and there was a full crop the next season. The fact is not so easy of explanation as some people think, but fruit trees like solid soil, not loose.

That digging amongst such plants as Raspberries and Strawberries must be a stupid practice is patent on the least consideration. Why manure a piece of land and then destroy the roots seeking to occupy it? When the roots have been mutilated, how can the plant be expected to bear drought or carry fruit? I saw at Berry Hill, near Mansfield, the other day, a large bed of Hautbois Strawberries with as much fruit as any common variety might be expected to carry, and this on light land. Other varieties were loaded with the largest crop I ever saw in my life. I asked Mr. Cope, the gardener, how they had been managed. He said as soon as the crop was gathered all weeds, runners, and dead foliage had been removed, and the ground between the rows covered with a very thick dressing of manure. The rows had also been watered two or three times with manure water. The plants were then encouraged to make a strong healthy growth in the autumn. The whole land was full of roots, and covered, as the surface was with the remains of the manure, the plants had not suffered from want of rain, whilst Strawberries in the neighbourhood, on better soil, which had been dug in the winter, were burning

up. Ram the soil hard whilst dry when potting Vines, Peaches, or any other fruit trees, keep fruit-tree borders solid and mulched with manure, and there will be fewer failures in fruit culture.—J. R. PEARSON, *Chilwell*.

ROYAL BOTANIC SOCIETY.

THE July Show of this Society opened yesterday, and will close to-day. The large tent, which in former years was filled with fine specimen plants, chiefly stove and greenhouse, is on this occasion principally occupied by table decorations, bouquets, and hanging baskets, to the exclusion of all other examples of horticultural skill. The substitution has been too much in one direction, and it is not altogether satisfactory; the place is not suited for such a display, and such a display without fine specimen plants is scarcely what we look for as an encouragement to horticultural skill; an encouragement to artistic arrangements it undoubtedly is, but that, though it should not be lost sight of by a horticultural society, is less to be considered by it than excellence of cultivation. The artist wants the graceful in form, the beautiful in colour, and whether the plants be well-grown or ill-grown matters little to him; he can skip from flower to flower till he has gathered sufficient for his purpose—the wreath of to-day that will be faded to-morrow, and lost for ever if not depicted upon his canvas.

Horticulturally, then, fruit is the great feature, and of that there is not very much; it is very good without being super-excellent, and there is none of it bad.

The best collection of fruit arranged as a dessert comes from Mr. Johnson, gardener to the Marquis of Aylesbury, Savernake, and consists of two Queen Pine Apples, Black Hamburg and Muscat Grapes, Bellegarde and Tete de Vents Peaches, Elnage and Violette Hative Nectarines, two Melons, Black Tartarian and May Duke Cherries, two kinds of Strawberries, and White Currants. Mr. Bannerman, Lord Bagot's gardener, at Rugeley, is second with excellent Pines, Grapes, Peaches and Nectarines, Cherries, Strawberries, and Melons. Mr. Clark, gardener to Earl Cowper, Brockett Hall, is third, and Mr. Carr fourth.

The best six dishes of out-door fruits consist of Gooseberries, Currants (White and Red), Cherries, and Strawberries, from Mr. Gardiner, gardener to P. Shirley, Esq., Eaitington Park, Stratford-on-Avon. Mr. Clark, gardener to Earl Cowper, is second; and Mr. Harvey, gardener to B. Wroughton, Esq., third.

Pine Apples are but poorly represented as regards number, but are generally good. The best Queen comes from Mr. Acres, gardener to Mr. Copestake, Highgate, and is a splendid fruit of 6 lbs.; the second best, weighing 4 lbs. 10 ozs., is from R. H. Smith, Esq., Calderstone, Liverpool; and the third best is Moscow Queen, from Mr. Gardiner. Mr. Miles, gardener to Lord Carrington, Wycombe Abbey; and Mr. A. Wright, gardener to C. H. Roberts, Esq., Regent's Park, also send very good fruit of the same variety. For the best Pine of any kind, Mr. C. Penford, gardener to Earl Radnor, Longford Castle, Wilts, is first with Providence; Mr. Bertram, gardener to R. T. Crawshaw, Esq., Cyfarthfa Castle, Merthyr Tydvil, being second with the same kind weighing 8 lbs. 1 oz., but not quite ripe at the top. Mr. Acres is third, with a finely-ripened 5-lb. Queen; and Mr. Miles and Mr. Ward fourth, the former with an 8-lb. Providence, and the latter with a Smooth Cayenne of 5½ lbs. In the miscellaneous class the first prize is awarded to Mr. H. Harvey, gardener to B. Wroughton, Esq., Woolley Park, for three Queens fifteen months from the sneaker, weighing collectively 11½ lbs. The best pair of Pine Apples in pots come from Mr. Miles, Lord Carrington's gardener, and are of the Queen variety, bearing fruit averaging about 4 lbs. The gardener to Mr. Flower, Tooting Common, comes second with well-fruited plants of the same variety, and Mr. Hepper, gardener to J. Walmsley, Esq., The Elms, Acton, is third.

Melons are but few. The best and second best in the green-fleshed class are small fruit of Marquis of Ailsa and Dr. Hogg from Mr. Crane and Mr. Gardiner respectively. Scarlet Gem and Meredith's Hybrid Cashmere take the prizes in the scarlet-fleshed class, the one coming from Mr. Cross, gardener to Sir F. Goldsmid, Burt, the other from Mr. Burnett, gardener to Mrs. Hope, The Deepdene, Dorking.

Of Grapes there is but a small show; there are competitors enough to take all the prizes, and only a few are left "out in the cold." The best 12-lb. basket of Black Grapes comes from Mr. Ward, gardener to T. N. Miller, Esq., who has finely coloured Black Hamburg. Mr. Davis, Whetstone, is second, and Messrs. Standish & Co. third with Royal Ascot. The best baskets of White Grapes (Muscats), are from Mr. Osborn, Finchley, and Mr. Davis.

Of Black Hamburgs splendid bunches in size, berry, and colour from Mr. Penford, Earl Radnor's, are first, and fine bunches from Mr. Bannerman second, Mr. Davis being third.

Muscats from Mr. Pizzev and Mr. Davis, though the best, are not ripe enough. The former has also a first prize for an excellent bunch of Royal Muscadine in the class for any other kind. Mr. Penford is second with good bunches of Black Prince.

Of Peaches Mr. Lynn, gardener to Lord Boston, Hedsor, and Mr. Miller, Combe Abbey, send fine dishes of Grosse Mignonne, Royal George, and Violette Hative, and take first and second prizes. For Nectarines Mr. Miller and Mr. Lynn are respectively first and second, the former with very fine examples of Violette Hative and Elnage.

For Cherries Mr. Miles, gardener to Lord Carrington, is first with beautiful fruit of Bigarreau Napoléon; Mr. Widdowson, Chorley Wood House, being second, and Mr. Ross third. For Black kinds Mr. Pettie is first with Black Tartarian, and Mr. Miles second with May Duke.

Only one dish of Plums is shown, and that is Orleans, by Mr. Miles, and excellent they are. The same exhibitor also sends the best four dishes of Strawberries, magnificent fruit of Admiral Dundas, Dr. Hogg, Sir C. Napier, and Mr. Radclyffe, the first two being the finest. Mr. Widdowson is second, Mr. Douglas, Loxford Hall, third, both with excellent dishes. Mr. Miles also sends an excellent dish of Bietou Pine.

Of table decorations there is a tolerably extensive display, as well as of bouquets, hanging baskets, and Fern cases. Some are tasteful enough, but none very remarkable. Miss E. Blair, New Wandsworth, was awarded H.R.H. Princess Mary's gold medal for a group of plants and flowers, and arranged for table decoration. Mrs. Green, Crawford Street, Grosvenor Square, and Misses Harris & Hassard were also successful exhibitors in several of the classes.

Groups of new and rare plants come from Messrs. Veitch and Mr. Williams; of bedding and other plants from Messrs. Lee and E. G. Henderson; and plant cases, horticultural implements, &c., from Messrs. A. Henderson & Co., Deane & Co., and others.

Her Royal Highness the Princess Mary distributed the ladies' prizes on the first day of the Show.

AMERICAN POTATOES.

I HAVE often seen in your Journal different accounts about the new sorts of American Potatoes, but I have never seen where they have been dug earlier than I might have dug them if I had liked. I left them, however, until they were dead ripe. We should have had much finer Potatoes had there been rain, but I am sorry to say there has not been any rain here for the last eight or nine weeks, and then for only about three hours, and there has not been four hours' rain for this last four months. The Potatoes were as follows:—

Climax, planted February 28th, three Potatoes cut into fifteen sets. Fit to dig June 7th; dug June 30th; weight 6 lbs. 5 ozs. Early Rose, planted February 28th, six Potatoes cut into thirty-eight sets. Fit to dig June 16th; dug June 30th; weight 14½ lbs. On the same border was Myatt's Ashleaf, planted the same day and dug May 20th. On another border with the same aspect was Breesee's Prolific, planted March 15th, but it is quite green and a long way from being fit, but when I dig up the tubers I will state how they turn out. Breesee's King of the Earlies, planted March 15th, was fit to dig June 7th, and was dug June 30th. Two Potatoes had been cut into six sets. Weight of produce 2½ lbs. Myatt's Ashleaf, planted March 15th, was dug June 1st; the sample was not large but beautiful, clear, and clean. The earliest of any of the American sorts, you can see, is the King of the Earlies, and it is the smallest cropper, but I think none so early as Myatt's. I dug up some Potatoes out of doors as early as May 15th; but they are a round sort taken when half ripe for market, not a good sort for table. The variety is here called the French White, but I do not know if the name is correct.

There is a beautiful specimen of the *Agave americana* throwing up a flower spike in a gentleman's garden by the side of the road. The place is called The Grange. The spike is now about 6 feet in height. American Aloes are quite hardy here; that referred to has had no covering to my knowledge this winter.—*J. Dawson, Gardener to W. H. Smithard, Esq., Somerville, Guernsey.*

NEW BOOK.

Handbook of the Sulphur Cure as applicable to the Vine Disease in America. By W. J. FLAGG. New York: Harper and Brothers.

ONE of the most decisive examples of needless book-making we ever saw. The whole of its practical contents may be comprised in one sentence—Apply flowers of sulphur either by the aid of a pair of sulphurator-bellows or a dredger.

WEAR AND TEAR OF THE WORLD.—In a paper in the *Bulletin de la Société Vaudoise*, No. 62, Dr. C. Nicati gives a *résumé* of various researches respecting the peculiar red snow which occasionally falls in the Grisons. Some of this snow fell, mingled with common snow and rain, during a violent storm from the south-west on the morning of January 15th, 1867, in various places. The chemical analysis of the melted snow demonstrated the presence of minute quantities of sulphate of lime or gypsum, sulphate of magnesia, organic matters, chlorine, and iron;

and microscopic examination detected vegetable fibre, pollen, spores, with here and there diatoms and small crystals. The colour varies from brick red to a pale yellow. This snow is quite distinct from the red snow of the upper Alpine regions, which owes its colour to the presence of the minute plant *Protococcus nivalis*. After discussing various theories respecting its origin, Dr. Killias expressed his opinion that it is the dust of the Desert of Sahara, transported by a sirocco, which gives the colour to the snow of the Grisons. Dr. Nicati gives many interesting particulars, with analyses, of the Algerian sirocco dust, and of the mud-rain in Naples and Sicily; and Professor C. Cramer states that he has discovered, both in the sand of the Sahara and in the red snow of the Grisons, particles of vegetable organisms (especially polythalamia) and minute fragments of animal origin, such as wool, hair, &c. He considers the presence of gypsum in the red snow an incontestable proof of its containing matter conveyed from the Desert of Sahara.—(From our weekly contemporary, *Nature*.)

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

ON the 29th ult. the twenty-seventh anniversary festival of the above Institution was held at the London Tavern, the Rt. Hon. The Earl of Derby in the chair. His Highness The Nawab Nizam of Bengal, attended by Colonel Layard, honoured the Institution with his presence upon this occasion. After the usual loyal and patriotic toasts had been proposed and duly received, Lord Derby proceeded to the toast of the evening, "Success to the Gardeners' Royal Benevolent Institution." He said that he should propose that which was the toast of the evening in very few words, for whatever they might agree upon, or whatever they might disagree upon, there was one thing in their hearts in which they would all be of one mind, and that was that the sight of flowers, accompanied by music, was much more suitable to after-dinner hours, and more conducive to enjoyment than anything else. The Institution at the end of 1869 carried over a balance of £1400, and had invested in the funds nearly £8000, the number of pensioners at the present time being fifty-four. Since the establishment of the Institution upwards of £15,000 had been expended in giving relief in accordance with the conditions laid down by their rules. So far, the position of the Society had been one of steady and unvaried prosperity, not, indeed, so much as they might have hoped or desired, but still, upon the whole, satisfactory. Their chief difficulty had been that, extending their operations as they did over the whole of the country, the list of subscribers still remained much smaller than they wished to see it; but certainly when he looked at the number of persons employed in the profession of horticulture, and at the support which had been given by the leading men in the profession—men known all over England, he could not help thinking that with better organisation they might contrive to extend their operations far beyond their present range. He thought there was no need to argue in defence of the principle on which the Institution was organised, that principle being one partly of charity and partly of insurance. Nearly every occupation existing in this country had found it to their interest to adopt this principle. Their rule for giving assistance was, first, that the fact of the distress should be proved, next that the character of the claimant should be ascertained, and then, without absolutely excluding non-subscribers, preference should be given to those who had during fifteen years contributed to the funds of the Institution. This preference was only fair, because, in point of fact, those whom they were assisting were merely receiving back that which they had subscribed in days of prosperity. He conceived that this kind of charity was the best for several reasons; first, because persons who follow the same business have means of ascertaining the condition of the applicant for relief which others do not possess, and thus there is a check upon imposture; and next, because the fact of previous subscription excludes mere recklessness and improvidence, and so calls into play those principles which are the most pure. He ventured to think that if every trade and every profession had an institution such as theirs, and if it became a sort of social law that every member of every trade should subscribe to it, a great blow would be struck at that pauperism which now affects England so much, and we should get rid of the increasing number of cases of pitiable and preventible misfortune. He need hardly say that of all those—and, unhappily, there are many—who come to a state of destitution in this country, none are so much to be pitied as those who previously held a good position, because the better their position was in former days, the more they shrink from contact with the lowest and coarsest of those among whom pauperism exists. In the present day we live too fast, and too often we live in such masses that hardly anybody would like to say what his next neighbour was; but those who are engaged in the same occupation should hold it a duty to assist their poorer brethren. It gave him great pleasure to preside over a gathering such as that, when the members of the same trade were brought together, not in professional rivalry and antagonism, but with a common desire to assist the afflicted. He often thought that a good garden was the prettiest thing on the earth. A man might walk through a picture gallery and see a

great picture or statue, and yet it would only create within him a feeling of admiration; but you might take the dullest lout out of the streets, or the most savage Arab who ever slept under a dry arch, put him amongst flowers and trees—things which appeal to something in the man that awakens within him a consciousness of his duty to his Creator. He believed that anything which tended to refine the popular taste deserved encouragement by the nation.

Mr. R. Garth, Q.C., proposed the health of the noble Chairman in terms the most eloquent.

The Earl of Derby, in responding, announced that H.S.H. the Prince of Teck would honour the Institution with his presence at the next annual festival.

Mr. Donald Nicoll proposed the health of the Vice-President of the Institution, and Mr. J. J. Mechi responded in suitable terms.

The Secretary announced the amount of the subscriptions premised at the festival to be upwards of £500.

The Chairman then proposed the health of the Secretary, which Mr. Cutler briefly acknowledged.

Groups of plants for the decoration of the room were contributed by Messrs. Veitch, Lee, B. S. Williams, Turner, and Carter & Co.

THE NEW ROSES

AT THE ROYAL HORTICULTURAL SOCIETY'S SHOW.

As the report already given has entered largely into the general character of the Show and named the successful competitors, I shall confine myself to the new Roses—viz., those of 1868 and 1869, not specifying the stands, but picking them out here and there.

Edouard Morren was again largely exhibited. My opinion of it remains as it has always been; it is a somewhat coarse flower, and inclined, like General Washington, to shew a green eye. Probably not one bloom in a dozen would be fit to put into a stand of twelve, but when caught it will grace any stand. Reine Blanche, as shown here and at the Palace, was a great deal too rough for exhibition, and a good white Rose is still a desideratum. Nardy Freres is a good Rose, as I have said before, somewhat dull in colour, but we must wait for another season before deciding finally as to its position. Madame Clert is a very pretty bright pink flower of good shape; and Thyra Hammerich a very pretty blush white Rose with shell-like petals, formed somewhat in the style of Baronne Prevost, only a little more cupped—very pretty indeed at times. Souvenir le Monsieur Poiteau has come very rough this season where I have seen it, but its colour will always ensure it a welcome. Mademoiselle Eugénie Verdier is a very pretty Rose, and likely to be an acquisition. Of Clémence Raonx a box was exhibited by Messrs. Lee, and if constant to that state it was decidedly a novelty, being of a light blush ground distinctly margined with pink. Monsieur Journeaux is of a very peculiar shade of colour—reddish scarlet with a purplish tinge through it, good form and large; this struck me as a very desirable Rose. Marquise de Mortemart is an undoubtedly good Rose in a section where good flowers are much wanted, blush white; Madame Creyton, a fair Rose; Devienne Lamy, again shown in good condition; Henri Ledechaux, a fine carmine Rose, of which I have again to say that it deserves to be grown more than it has been; Julie Tonvais, a very curious Rose with large petals, almost reminding one of a Tea, but I think one not likely to be of much use; Emilie Hansburg, a prettily-shaped pale rose, and with imbricated petals—a flower deserving of being grown if its habit be good, which it seemed to be; Madame Joséphine Guyot, a very pretty and well-shaped Rose, which I cannot find in any catalogue; Victor Trouillard, too rough; Victor le Bihan, beautiful bright rosy carmine; Dupuy-Jamain, of which I have again to repeat what I said, that it is a beautiful carmine Rose well worthy of cultivation; André Fresnoy, not very remarkable as shown. The same may be said of Ferdinand de Lesseps and of Comtesse d'Oxford.

It will be seen from the above that comparatively few of the new Roses of this season have been exhibited—not one of the Teas; one Noisette, Reine d'Or, at the Crystal Palace; and not above five or six of the Hybrid Perpetuals. This is to be accounted for by the fact that nurserymen are busy propagating them, and hence cannot afford to allow their plants to grow on for exhibition. Of those of 1868 the following have, I think, made good their claim to remain amongst our favourites—Devienne Lamy, Dupuy-Jamain, Edouard Morren, Henri Ledechaux, Madame Creyton, Marquise de Mortemart, Monsieur Journeaux, Souvenir de Mons. Poiteau, Thyra Hammerich, and Victor le Bihan.

I have bloomed some of the new Tea Roses, and am inclined to think that we have some good kinds amongst them. Chamois is rightly named, but there is too little of it. Madame Ducher has a good deal of aueology, as I have it, with Devoniensis, and is a very fine Rose. Lamarque a fleur jaunes promises to be a good yellow climbing Rose. Unique is a very remarkable-looking flower, shaped like a Tulip, but I wait for another bloom before deciding. But to my mind the finest flower of the season, as far as I can see, and from all, too, that I heard in Paris, is Louis Van Houtte, raised by my old friend Lacharme, one of the most conscientious of our Rose raisers in France, and already dear to all lovers of the Rose by François Lacharme. Louis Van Houtte is likely, I think, to uphold his fame; it is of the shape of the old Cabbage Rose and of that fine Rose François Treyve; it has also the fine perfume of the old Cabbage; in colour it is like

Charles Lefebvre when it comes dark, approaching at times to that of Prince Camille de Rohan. The habit of the plant is vigorous, and altogether I am inclined to consider it the best Rose of the season. There is another Rose whose position is now so well established that it is not needful to say much of it, but I question if at the Show on June 29th there was one Rose which sooner caught the eye and held captive the beholder than Duke of Edinburgh. Mr. George Paul may well be congratulated on having sent out this fine English Rose, for in brilliancy of colour it is unsurpassed, while its fine habit gives it also a claim which many dark Roses do not possess.—D., Deal.

STRAWBERRIES NOT FRUITING.

THE soil for "Sir Harry" Strawberry has been highly manured, and is on a generous clay, but we have hitherto failed in procuring anything beyond most luxuriant growth and fine dark foliage—no fruit at all worth speaking of, although the bed is a large one. What would be the most judicious mode of treating this bed in order to insure fruit next year? I should add that this is the third year since the bed was planted.—F. U. S.

[Perhaps your instance of Sir Harry not fruiting, but growing so luxuriantly, may be partly owing to the rich manuring, and the strong rich soil in which the plants are growing. I have known cases of Strawberry plants taken from a prolific stock yielding but little fruit, owing to the over-luxuriance, of the plants, arising from rich manuring, and having the plants so close together in the bed that the sun had little power to ripen the fruit buds, and then the following year there was vigorous growth and only a sprinkling of puny flowers, followed by few and small fruit for the kind. If you determine to keep this bed of Sir Harry, and give the plants another chance, then I should advise the following treatment.]

As soon as the fruit is gathered I would remove all the runners, but keep none. In your soil there must no mowing off nor cutting the leaves, but I would go over every plant, and cut out with a sharp knife all the little pieces with the smallest buds from each plant, or rather stool, leaving to each three or four with the plumpest buds, and all the leaves attached to them. The sun and air will have more power to act on such thinned-out stools. By this thinning-out mode and surface-manuring, I have known Strawberries continued in prolific bearing for many years, and the crops were nearly as good as from those fresh planted every two or three years. In your case, as the plants seem very luxuriant, I would not manure with decomposed dung, but would merely place a little longish litter among and round the stools, to protect the buds from the frosts of winter and spring. If your plants have come originally from a prolific stock, with such treatment you would probably have a fair supply of fruit the next summer.

But though I should be glad if you adopted the above plan, and informed us of the results this time next year, for the benefit of all concerned, still as you state that you have had scarcely any fruit from these luxuriant plants for three years, unless the ground is of no consequence to you, I would advise you to have only a part of your bed so treated, and plant another bed with young plants obtained elsewhere from a prolific stock. I have proved over and over again that the above plan will often make unfruitful plants fruitful, but I have also proved, at least to my own satisfaction, that there are Strawberry plants, and not confined to this or that kind, so naturally sterile that no treatment will make them prolific. And what is more, I have found, and more especially of late years, from my attention being turned more to the matter, that the runners taken again and again from such plants continue sterile, though as an experiment I have repeated the process from year to year with Keens' Seedling, British Queen, Elton, and even Sir Harry. Such facts have so settled this matter down into a conviction, that had I time I would clear out every such sterile plant that did not show bloom the first year after planting. Unless taken as a runner from a prolific plant, there is the risk that it never becomes prolific at all, and there is a greater risk that from such plants you continue the sterility, as the sterile plants are always the most luxuriant, the most plentifully supplied with strong, fine-looking runners, and, therefore, are more likely to be selected for pricking out and planting than the smaller runners from prolific plants. Such plants, besides their excessive luxuriance, may also be distinguished, as already stated, by the number and strength of the runners, and by the buds of plants and runners being long and sharp-pointed, instead of more flat and obtuse. I have no desire to go beyond my own observations and experience, but I would not know-

ingly plant runners from such plants, and, of course, would not wish anyone else to do so except as an experiment. I have had plenty of evidence that such sterile plants are too likely to continue to produce sterile plants for many generations.

The evidence as to restoring plants taken from fertile parents that have become sterile from over-luxuriance or want of sun and air, is, so far as my own experience and observation go, more conflicting. Sometimes the remedy alluded to above has succeeded, at other times it has not, as there is too great a tendency in plants as well as in man to go on in a bad course when once it is fairly commenced.

This season I have been told of seven or eight fine-looking beds of Strawberries that did not suffer especially from the drought, and that scarcely yielded a bloom. I think it is three or four summers since I stated how I was invited to look at a large bed of Strawberry plants, chiefly Keens' Seedling, and nothing could look better at a distance. The flower trusses were just bursting the buds of my own at home. In this fine-looking bed there was not a single fertile bud, and for that season there could be none. The proprietor had so set his heart on this fine bed, was so hopeful for another year, that I felt shy in offering an opinion. At last, when pressed, I advised him to dig down the half of his bed, to plant a little piece with runners, and as a sort of encouragement, I was to send a lot of young plants, pricked out thickly the previous autumn, just beginning to burst their flower buds. From these little plants he obtained some fair fruit the first season, and they and their runners bore well afterwards. Of the runners planted from the first bed, not one was fruitful the following season. Of the old plants left thinned out and treated as above, some ten per cent. proved moderately fruitful the following season, the bulk, some ninety per cent., producing nothing but leaves.

One other case came prominently under my observation. The kinds were Keens' Seedling, Elton, and British Queen. The plants all looked well, but showed little bloom. Thinned out and treated as above, Keens' was much improved; British Queen was less so, but much better; but the Elton scarcely showed a flower bud.

The matter thus coming prominently before me, I have stated convictions based on what I think to be facts. I know that many hold a contrary opinion, but mere opinion is of little value unless based on something solid and tangible. It should ever be our aim, not so much to excite mere controversy as to get at the truth and what will bear on general utility. Whether contrary to or corroborative of these statements, I shall be glad to know the ideas of others, founded on observation and experience. Meanwhile, as a mere matter of common prudence, I would say, in conclusion, to all makers of fresh plantations of Strawberry plants, Choose your young plants from plants that have produced fruit.—R. F.]

THE ORCHARD HOUSE.

HAVING just seen "T. F.'s" remarks about potted trees (see page 260 of last volume), I should like to make a few observations on the subject. "T. F." has been already somewhat roughly handled by yourself, and one or two of your correspondents, and I have something to add on the same side. "T. F.'s" observations might operate upon those who have dabbled in orchard houses with doubtful success; but it is not very likely that they will have much effect on those who have tried the orchard house and found it answer. There can be little doubt that these structures are specially adapted for amateurs. Professed gardeners have, for the most part, voted them a nuisance from the beginning.

Only a fortnight ago I made a purposed visit to a celebrated nursery famed, not long ago, for orchard houses and orchard-house trees. I had read a glowing account of these, and was anxious to impart or receive hints on the management of the trees, as the case might be. On asking one of the workmen where the orchard house was, he pointed me to a lot of trees, in pots it is true, but ignominiously expelled from their previous more dignified quarters. On the foreman making his appearance, I good-humouredly rated him on the subject, and he was fain to admit that he and his brethren generally had a thorough contempt and dislike for the system. Now, as regards the attention required, it must be owned that for six months in the year it must be careful and unremitting. But it should be borne in mind that that attention pertains to a season in which there is a constant progression from flowers to fruit. There is the gratification of oneself and friends, first of all with the sight of foliage and fruit, to be at length consummated

by the gratification of the taste in eating it; and during the winter months, when there is nothing to be seen, no attention is required.

You put the matter well in stating that this mode of growing fruit brings an all-but-certain crop, and at an early stage of the tree's growth. I had two maiden Plums last November twelvemonth, Pond's Seedling and the Golden Drop; the former has this year fifteen Plums on it, and the latter eleven—quite as many as trees of that age and of these varieties should be allowed to produce. I myself budded a Reine Claude de Bavy two years ago last July. It is now a beautiful pyramid with the fruit reduced by thinning to thirty-four. I will venture to say, I might have had a tree of that variety in the open ground a dozen years, and not have had so many during the whole time. I should have been satisfied in my rough houses with growing Plums alone. I have fifteen varieties of these, and nearly all the trees after thinning have, perhaps, more fruit on them than ought to be allowed, ranging in number from fifteen to thirty. I have ten Peach trees averaging a dozen on each. Apricots, moreover, are doing well, and as in the case of the maiden Plums, two Apricots the same age have two dozen between them.

With regard to the number of fruit potted trees should bear, there is, I think, a little confusion. It would be much better if the matter were more regulated by weight than number. Take, for instance, a Golden Drop or Jefferson Plum and a Green Gage. I should allow the latter to bear at least double the number of the former. The same rule should be applied throughout, so that a tree from five to six years old should be allowed to produce from 4 to 5 lbs. of fruit and no more.

We learn to modify and alter our plans and modes of treatment from time to time. I give less water to my trees than I did two or three years ago, and with good results, but, of course, with careful watching. Up to last year I perceived the leaves at the points to a considerable extent brown and shrivelled. I attributed it to syringing in the morning in bright sunshine. This year I do not syringe uniformly in the morning, but do it liberally about sunset. The leaves thus continue damp all the night, making an uncomfortable home for the red spider.

With regard to "T. F.'s" motto, "Let us down with such torture and cruelty," I have been cruel enough to pinch rather closely all along; but having read M. Du Breuil's book, I am now pinching the Peaches more closely than ever. I cannot tell what the result may be, but appearances are in its favour. My trees are looking more promising this year than usual.—J. M.

A CLEAR HEAD, A PROMPT WILL, AND A READY HAND.

"I DON'T believe it." "Don't believe what?" was the reasonable response, for my friend was not aware that I was reading about Selsey, and that Bede stated it was so called because seals frequented the coast. I read the passage aloud. "Well," said my friend, "Venerable Bede was more likely to know than you." "Not a bit of it; he might be venerable as an ecclesiastic, and not at all venerable as an etymologist. You remind me of the boy who wrote the word 'sut,' and justified it on the ground that the chimney-sweeper so spelt, and 'he ought to know!'" "What's your guess at the derivation?" "Sel, a mansion, and sea, the sea—pure Anglo Saxon." No response from my friend, so I conclude it was convincing. He resumed his writing, I returned to my book.

"It's just 800 years since." "Since what?" said my again-interrupted friend. "Since the bishop's see was removed from Selsey to Chichester." "Who cares about that?" said my friend resuming his writing, and I, adjusting my spectacles, again returned to my book.

"It is incredible that he taught them to catch fish, they must have known that." "Who taught—who was taught?" "Wilfrid, Bishop of Hexham, is said to have taught the Selsey men." My friend laid down his pen and inquired, "Why on earth do you keep bothering about Selsey? I was there some years since, and can testify that Lord Selsey keeps his estate there in admirable order. The crops are good, tenants are prosperous, and the whole peninsula is flat as a pancake. The old Anglo-Saxon city's site is now ever under water, and the fishermen cast their nets over shallows still known as 'The Park' and 'The Street.' Now, that's all, so why keep up such a bother?" "All! Why, that sulphurator you tried and so belauded at South Kensington is made at a manufactory at Selsey." "No! Humbug; a manufactory is as likely to be found

at the Needles or Land's End." But I was not to be batted down in that mode, so I talked at intervals, as much as was politic, until luncheon time, and then and there, over "the cakes and ale," my friend agreed to journey with me the next day to Selsey. It's not the first time we have so journeyed; and now, as on former occasions, we had gleaned relative gleanings, and what follows were our conjoint contributions.

The Wilfrid already mentioned founded at Selsey a monastery of Benedictines; and Bede says that when, for the endowment of that and the bishopric, the South-Saxon king gave Wilfrid the whole peninsula, he gave him also the inhabitants, and Wilfrid by baptising them rescued them from the servitude of the Devil. A subsequent bishop, however, found that posching reduced them again to be Satan's slaves, for Bishop Bede in 1407, by a mandate still preserved, condemned to the greater excommunication certain "children of damnation, who, influenced by the spirit of the Devil," killed game in the bishop's demesne of Selsey. The greater excommunication was no trivial infliction, for it not only excluded the excommunicant from the church sacraments, but rendered him incapable of any legal act, and forbade his intercourse with any of the faithful. Moreover, if he did not within forty days pacify the ecclesiastic who excommunicated him, a writ was issuable for his apprehension and close confinement until he submitted and obtained absolution. I wonder what fine the bishop imposed upon the "children of damnation" before he forgave their venison theft.

No venison is in Selsey now, for, as already told, the inroads of the sea have involved the bishop's park, and the whole peninsula is well enclosed and highly cultivated. The prevailing soil is a strong loam, and now, despite the prolonged drought, the Wheat crops were vigorous and heavy. I say the peninsula is "well enclosed," because the fences are all so thoroughly sustained that they afford unmistakable evidence that Lord Selsey and the farmers—landlord and tenants—are all worthy of the relationship.

Despite the long drought all vegetation looked vigorous. Never did Roses look more healthy—one more instance confirming our opinion that mildew and blotched leaves are chiefly due to ungenial temperature. We should have liked to explore the sands for the Sea Bindweed (*Convolvulus edosandella*), a native of the Selsey shore, and to search for the Sea Pink (*Dianthus profler*), once abundant, but said now to be found there no longer. Want of time, however, forbade our visiting elsewhere than the manufactory, our special object. A pilgrim had been there before us, and thus well sketches an outline of what he saw at Mr. Colin Pullinger's:—

"We entered a large yard, with the figurehead of some old vessel staring us out of countenance. There were some sheds, carthouses, stables, and stores on the one hand, and a line of workshops on the other. 'We cannot afford to use a steam engine yet,' he said, 'so we get our motive power from poor old Bob,' and he kindly patted the horse upon the neck as it passed us on its circular journey. I could hear the baz, the whir, the whiz of the machinery, but mingled with it I heard, too, the notes of a fine old hymn tune. 'My lads don't always sing hymns; they have a song occasionally,' said my conductor, and he added, 'sawing up the wood is rather monotonous work; they have little to think about, for the circular saws are all so guarded that they can't have an accident, nor can they make a false cut. So I allow them to sing while at this kind of work,—it keeps them in good temper.'

"We stepped into the shop and saw a dozen wheels revolving; there were saws, from the size of a crown-piece up to 3 or 4 feet in diameter, hissing their way through the wood; there were holes being drilled; queer-shaped bits of wood fashioned into form; wire and zinc cut up like so much thread or paper; and all with the unerring regularity of a bit of watchwork. It was pointed out to me that each man and boy had a form, or mould, to work by, thus rendering it impossible that even a tin-tack could be driven into the wrong place, or a scrap of wire cut too long by so much as a hair's breadth. The whole of this machinery (with the exception of the circular saws) was not only invented by Mr. Pullinger, but actually made upon the premises, and by the men and boys gathered out of a village where the one half are fishermen, the other agricultural labourers.

"I am not going to describe the processes passed through in making a single trap; it might be tedious, or, to be more candid, I should be sure to fail in doing it. Nor shall I say a word about Pullinger's patent self-adjusting trap; it is too widely known to need that, though few may know where or by whom they are made. The individual traps sell for a mere trifle, yet each one is composed of seventy pieces; each side of the trap passes through twenty-eight hands, and, after the pieces are all made, it passes through the hands of twenty-seven more; in all, about 120 distinct operations are required for the making of one trap.

"The 'hands' whom I saw working in the various shops varied in

age from about seven to seventy. The youngest was poking about in a tray of dust with a common magnet. I asked what the little fellow was doing, and received a characteristic answer—one that should be written up and followed in every workshop in the world; it was:—'We cannot afford to lose anything here. He is picking out every stray tack, every scrap of wire, every morsel of metal of any kind which may have been dropped among the sawdust. It is like play for him.' The little man looked up with a happy face, and proudly pointed to a couple of nails dangling from the end of his magnet.

"We had just left the last shop, when, at a given signal, all left work for the night. 'Some of them will be back by-and-by,' said my guide; and then, upon inquiry, I found that the boys and a few of the adults came to an evening school, of which Mr. Pullinger and his foreman were the teachers. The lads availed themselves fully of the advantage, and in winter time the average attendance was about thirty. Mr. Pullinger has also established a penny bank for the use of his workmen, and there are rather more than forty depositors. One other little fact, showing the fatherly attention paid by the proprietor to his hands, and I have done. In the middle of the morning's work the boys are allowed to run out in the great yard and have a jolly game among themselves for a quarter of an hour or so."

We confirm all that our pre-pilgrim states, and we add that never was space better economised. The machines for sawing, &c., are very numerous, and have to be so arranged in a limited space that not a foot is wasted—and not a foot is wasted. All the saws are circular, varying in diameter from an inch or two to as many feet, and all are turned by the strength of "Bob." Among the save-alls of time we noticed a double-bladed mortice-chisel, invented by Mr. Pullinger, which cuts both sides of the mortice at once. So deeply were we interested by all we saw and by all which we heard, that we asked Mr. Pullinger to tell us a little of his history, and we publish his reply as an incentive to others:—

"I am a native of Selsey. I have received a very plain education. My parents removed to Brighton when I was about twelve years of age. I was there apprenticed to a law stationer. My master failed in business. I was then a writing clerk in a solicitor's office for about five years. Not liking the confinement, I went to sea for about five years, filling nearly all situations on board ship. My parents were getting old, and wished me to give up the sea. I came again to Selsey, where I undertook to do anything which was offered me to do. I was never apprenticed to any mechanical trade, but found no difficulty in doing any sort of work. I always had an inventive talent, but it was years before I could bring it to any use; whatever I made or invented was thought but little of by my neighbours. I made a mouse trap. They then pitied me for the sake of my wife and children, thinking I should bring them to want; the mouse traps sold. I could not make them fast enough by hand, I had not the means to buy machinery, so I made it myself. I always found as soon as I made one thing I could improve upon another; and so I went on, always an up-hill game with me, for all my profits went to inventions and improvements, but by perseverance I overcame all difficulties. My machines I always made of the most simple description, so that I could get the children, labourers, and fishermen to use them, and so that they could not well make a mistake in their work. To many a man from the plough or fisherman in the winter when out of work have I given employment, otherwise they must have gone into the union house at West Hampnett, as well as many children who, when they enter my employment, I consider as my own, teaching them all I know in the day, and in winter evenings having a school, and charging 2/ per week to every one who likes to attend to be taught reading, writing, and arithmetic, although that is at a great loss to me, having no assistance from any one. I employ many teachers, so that the children may receive all the instruction possible, and to many who could neither read nor write I have given a fair education. I take but little credit to myself for what I have done; it comes into my mind with but little thinking; the same as what you said to me last evening came into my mind this morning—a thought entered my mind, I carried it out, tried the invention, and found it answer, before nine o'clock. The only thing I think where I have done some good is in having spent hundreds of pounds in labour, and given many a family a dinner who otherwise would have been without one."

Mr. Pullinger proposes showing this year at the "Workmen's International Exhibition," to be held in the Agricultural Hall, Islington, the following inventions:—

1. Automaton mouse trap.—Each mouse caught resets the trap.
2. Perpetual mouse trap.—Always set.
3. Self-acting mouse trap.—Each mouse caught resets the trap.
4. An improved rat trap.—One of the best to catch rats.
5. An improved beetle trap.—Will catch hundreds at once.
6. An improved eel spear.—To catch more than others.
7. A sulphur distributor.—To destroy mildew, &c., on Vines, flowers, &c.
8. A washing machine.—Saving labour, money, and confusion.
9. A wringing machine.—Simple and effective.
10. Cinder sifter.—To sift without dust.
11. Cask stand.—To stoop with ease and draw off clear.
12. Tapping mallet.—To drive in and take out taps.
13. Model for a steam boat.—To obtain greater speed.

14. Morticing chisel.—To cut both sides at once.
15. Bradawl.—To drive in and jump out again.
16. An improved plane.—To keep the mouth always fine.
17. A machine to straighten wire.—Simple and effective.

The sulphurator and the mouse traps we have tried, and can testify are very effective. The traps continue selling at the rate of nearly two thousand weekly; and we were much amused by the foreman observing that he was with Mr. Pullinger when he first commenced making them, fourteen years since, and he added, "When we had made six dozen we wondered who'd have 'em." The following is a drawing of the sulphurator and

mode of employing it. It is a box fitting on to the nozzle of a common pair of bellows, and so made that every puff of air delivered from the bellows diffuses a cloud of sulphur over the parts of the tree towards which it is directed.—G.

THE FRENCH HORTICULTURAL EXHIBITION.

(Concluded from page 392.)

AFTER having seen as far as was stated in the Journal of June 2nd, I naturally enough looked for the bouquets, vegetables, and objects of art. These I found arranged in the arcades at each end of the Palais.

Bouquets were not numerous, being confined to two exhibitors only, but were very tastefully arranged; they consisted of bouquets for weddings, balls, hall, table and drawing-room decoration, the latter built up in vases of fanciful pottery. One very handsome and rich centre-piece consisted entirely of Orchids, and was lovely. A silver-gilt medal was awarded to M. Bernard, 3, Boulevard Malesherbes, and a silver-gilt medal to M. Labronier, 9, Rue de Seze. Both were well worthy of what they gained.

Exotic fruits were very well represented by one house—viz., that of M. Hediard, 13, Rue Notre Dame de Lorette, Paris, and to whom a silver-gilt medal was awarded for the collection. The principal specimens of interest were fresh pods of Vanilla, fresh Dates and Bananas, Pear Oranges, Sweet Lemons (very large); also Loquats, or Japan Medlars, the fruit of *Eriobotrya japonica*; the round bright yellow fruit, about the size of small walnuts, being as produced naturally upon the racemes. The above were all productions from Algeria. Calabasses (or fruit of *Crescentia Cajete*) came from the Island of Martinique; and collections of dried and preserved fruits, Nats, &c., from Guadeloupe, Cochin-China, Havana, Senegal, Spain, and other countries, made the collection very interesting. All the articles were for sale, and although a pretty good trade was kept up, as each article diminished it was replenished from a reserve.

Vegetables were very few, and quite of secondary merit, a fact rather surprising, for much better could be found in the markets. The awards for what were shown consisted of a silver-gilt medal to M. Petit for six passable Cauliflowers, and a large silver medal to M. Lesbre, Ebreuil (Allier), for a large collection of varieties of old Potatoes. Another collection of Potatoes (new) in sixty-two varieties, was exhibited by a M. Heriellard; these received a silver medal. Another large silver medal was awarded to M. Dagnaux for a collection numerous in variety, but very poor in quality. Yet another large silver medal, and this was awarded to M. Entraygues for a small collection, but tolerable in quality; it consisted of six Tomatoes, a few Ashleaf Kidney Potatoes, Dwarf Kidney Beans, young Turnips, Peas, small green and large yellow Cucumbers, two bundles of Asparagus, a bunch of Radishes, and three Melons. This ends the vegetable part, and now attention will be directed to the objects of art and industry exhibited. But there is something that first attracts attention. What is it? Why, some fruit trees. Two Pears, two Apples, two Cherries, two Currants, and two Vines, the whole in pots, trained up spiral columns of galvanised-iron wire, reaching about 2 yards high. The trees shown, as could well be seen, had been trained on this system from their infancy, and had attained three-fourths of the

height of the columns, had plenty of fruit upon them, and, being subjected to pinching, produced a spiral cordon. They were exhibited by the person interested in the sale of the wire columns. The wire was about the size of an ordinary lead pencil. By the side of these trees were two squares planted out with Strawberries and salading, the ground covered with short manure, and one square covered afterwards with earthen tiles, and the other with glass tiles, these being illustrations of how to use the same, offered by the vendor for the purpose of keeping the soil cool and damp for the benefit of the plants cultivated in the summer months. The contrivance has a very clean appearance, as may be supposed, and might be amusing to amateurs, but I doubt it would not answer in large gardens, and, again, must be the means of excluding air, which is so beneficial to the well-being of the plants.

Horticultural structures were fairly illustrated by three or four makers with greenhouses lean-to and span-roofed, propagating houses, &c., and were, with only one exception, entirely of iron, and had curvilinear roofs, this being at the present day the fashion in France. Melon frames were also plentiful, some with oak frames and iron lights, others all of iron, and, being bolted together at the corners, they can be put up in winter in very small space. Messrs. Lefebvre-Dormois, Rue de Fanbourg du Temple, 92, Paris, received a large silver medal for their lean-to, all of iron, which is a very light, airy, and well-made house, but the top part of it is too flat, which occasions drip. Of this I speak from experience, as I have one such house; the defect could be easily remedied, and then the house would be one of the best forms made. There is a railing at the back for the purpose of attaching the cords, by which the straw mats are drawn up every morning in winter, as it must be understood all houses for horticultural purposes are in France covered with the universal *pallasson*, and this latter is generally made at home. They are a great guarantee against frost, and economise fuel, but cause a great deal of litter, which would not be tolerated everywhere. Another exhibitor, A. F. Maury, 17, Rue du Baisson, St. Louis, had several forms of houses, but received no medal. The houses from this exhibitor illustrated means of giving air by opening seven or eight lights at a time, but would not be an improvement on the winch method used in England, and which has been adopted for many years. The one house built with wood in place of iron was from M. Nattier, 240, Boulevard du Prince Eugène, and was said to illustrate a new system of ventilation, but was merely a slight modification of the well-known lantern.

Of boilers, five or six exhibitors came forward with various models of different systems, but I am afraid they would come to grief against an ordinary tubular, and especially a duplex. There was to have been a competition of boilers, but after having been postponed twice it did not come off at all. Our English boiler-makers ought to get up a friendly competition, and bring to light honestly and openly what each of their new or old inventions really can do, and at the same time make it international. It would be an interesting addition to next year's Exhibition, and prove of infinite benefit to the horticultural public.

Cutlery, of French manufacture, was well illustrated by Hardivillé, 218, Rue St. Jacques, Paris, who received a silver medal for the same. This firm is one of the principal for horticultural cutlery in France. One other exhibitor, Marmure, Faubourg Montmartre, 17, Paris, received honourable mention.

Ornamental ironwork, such as spring-bottom chairs for gardens garden seats, tables, iron fencing, and ornamental wirework, from the celebrated "Usine Tronchon," Avenue d'Eylau, 9, Paris, attracted considerable notice and received a large silver medal. Other exhibitors in this class were M. Borel, 10, Quai du Louvre, Paris, and M. L. Binet, Rue des Arts, 22 et 24, Paris, both of whom have received many medals from time to time.

Pumps, syringes, water-carts, &c., came from numerous exhibitors, and all of them had points, either good or bad, as compared with old systems. A most interesting part of the Exhibition were the many forms of jets for fountains. I may state that the Perfect Watering-can, as it is called in the English advertisements, was exhibited as *tabe arrosoir* by Charles Piersdorff, horticulteur, inventeur breveté, S.G.D.G., 110, Avenue de Saint Ouen, Batignolles, Paris, and 73, South Row, Kensal New Town, and was awarded a silver medal for the same. Are there two inventors? and which is the right?

Plant cases were shown in various forms; that which claimed most attention was a round case made in three parts, which may easily be

understood by the accompanying figures. It is made by Fenoglio, 1, Rue de Kabylie, 19, Arrondissement, Paris, who has already

received eight medals in gold, silver, and bronze from Hamburg, Italy, and France. None was given this time.

Vases, reservoirs, flower cases, fountains, &c., made on a new patent system of cement and iron were shown. The iron part is merely wire-work in squares, to which the cement is put on both sides; it appears to be very solid, as several cisterns were sent that had been in constant use for six years, and from which water had been taken out with watering pots, but these samples appeared as solid as ever.

The fly trap, spoken of in the English horticultural journals, was again brought to notice by the inventor himself—viz., M. L. Rommetin, Quai de Valmy, 93, Paris, and although it was not awarded a medal this time, it had already received several.

Imitation china was well shown by Lebourg, 43, Boulevard du Prince Eugène, Paris, in the shape of vases, &c., and was such an excellent imitation of old china-work that it was well worth the silver medal that was awarded. Vases and other ornamental articles for halls and rooms manufactured in delph were well brought forward by Barbizet fils, 17, Place du Trône, Paris, and who deserved well the silver medal that was awarded. M. M. J. Lenne et E. Lenne, Rue des 2 Ponts, 29 et 31 (Ile St. Louis), Paris, received a medal in bronze for the same.

This ends the description of the principal articles of interest, and although there were many things to interest a visitor, the Exhibition cannot, certainly, in some of its parts be said to be a fair illustration of French horticulture in general.—AINSI.

INSECTS INJURIOUS TO THE PEAR TREE.

No. 3.

SPILONOTA CYNOSBATTELLA—RED BUD-CATERPILLAR. It has also been named by entomologists *TORTRIX OCELLANA*, *PENTHINA OCELLANA*, *PYRALIS LUSCANA*, and *TINEA CYNOSBATTELLA*.

The moth is about three-quarters of an inch from tip to tip of the expanded wings. Fore wings white, tinged with brown; brownish black at the base, and blotched with bluish black. Hind wings brownish grey. The caterpillar is dirty flesh-colour, with darker lines down the back and sides; the head and neck brownish black, with pale spots. It passes into the chrysalis state in the flower bud it has attacked. The caterpillar appears at the time of the Pear bloom opening, and the moth is found early in July. The eggs are laid in the buds, and remain through the winter unhatched. A drop of sap often appears on a bud that is attacked. The bud seems glued so as to be unable to open. The caterpillar feeds on the young fruits as well as on the buds. It is full grown in about a month, and then spins a white cocoon, in which it changes to a chrysalis.

To prevent future ravages, the buds attacked should be destroyed with the ravagers they contain.

WATERING.

1st. Is it necessary to water newly-planted subjects, such as bedding plants, or kitchen garden crops? To this I reply—No, and in support of my opinion I advance the following facts. This spring and summer, so far, have proved remarkably dry, and, as usual, I see, as an every-day-affair, watering plants as soon as planted, and that it is followed up for weeks. Now india-rubber tubing is to be had at such a low rate, there seems to be no end of the work, and yet instead of plants looking better they look the contrary.

In the third week of May I turned out my bedding plants; it was very cold and dry, but as there were no signs of rain, and

being anxious to have less every-day-watering, I planted out. The plants having been in the trenches intended for Celery for a month, they were well hardened-off, and though since they were planted there have been but two parts of days rain, of which to-day (June 24th) gave the heaviest fall, I could not wish to see plants better, either as regards bloom (they are to-day a mass of flowers; Christine, Stella, Tom Thumb, Madame Vaucher, and Lord Palmerston Pelargoniums, and *Lobelia speciosa*, being lovely), or for foliage, and that, too, although they have had no water excepting the rain and dew. A friend called here on May 28th, and remarked how well the plants were doing, and said there must be root action. I lifted a plant that had been put in on May 23rd, and there were new white roots three-quarters of an inch long.

Now, I think there is nothing very remarkable about this. In March I manure and deeply dig the beds, which then remain bare till May. Between March and May we have much cold wet weather, but then we have much sunshine, which warms the ground by the time it is ready for planting. I thoroughly water in the morning the plants which I intend planting in the afternoon; I then plant them, and to me it seems like planting them in a gentle hobbed, as though the soil may be cold on the surface, it is not so underneath. The plant then being in a moist state, and the ground warm, the roots commence growing at once, and, of course, the tops will not be far behind.

The points in favour of a plant not being watered are—First, by thoroughly watering the plant some few hours before planting, it fills or feeds the plant, and, therefore, when it is planted out the ground, as I have tried to explain, being warm, it grows at once. Secondly, I lay the plants as near the ground as possible; by doing so, while the wind does not break them, the sap is equalised, causing the plant to become bushy. Thirdly, When it rains the plants grow very fast.

I will now take a case of watering. A plant is planted out; most likely it is very dry, as I have heard men say, Well, we are planting out so-and-so to-day, it will not require watering. Well, it is planted and then watered; in fact, I may call it watering the ground, as the plants receive very little of the water, especially if it is dry before planting, and the consequence is the plant is at a standstill. It cannot grow, the water given taking the warmth out of the ground, and once watering does not serve, and when it rains, having plenty of water before, they do not grow very fast. Let anyone try the two methods, and he will see the difference.

I may add, that in 1868, when plants in general suffered so severely, I had no occasion to water, and yet I had a most beautiful show, though I must say that deep cultivation has much to do with the well-being of plants.

The points against the watering are these:—

1st. By watering you starve the plants and prevent the roots pushing, as they will not grow in cold ground.

2nd. Extra labour, which though one may have, still it is loss of time; and then once water always water, and the ground must be often stirred or it becomes hard.

3rd. Watered plants will not stand the wind and weather, the water causing the tops to be tender.

With regard to kitchen-garden crops, I never water them, Celery excepted, and healthier growth I could not wish to see. In planting both summer and winter crops, I plant in drills. I cut Cauliflower which had received no protection since March 1st, on June 4th; I gathered on June 18th, Ringleader Peas, sown on March 9th, and Myatt's Prolific Potatoes, on June 22nd. This I consider early for my neighbourhood.—STEPHEN CASTLE, *The Gardens, Bent Hill, Prestwich.*

CROSS FERTILISATION AND THE LAW OF SEX IN EUPHORBIA.

MR. CHARLES DARWIN'S interesting observations on cross fertilisation have opened a new world for original discovery. The list of plants which seem to avoid self-fertilisation is already very large. I think *Euphorbia* may be added to the number. Certainly this is the case with *Euphorbia fulgens*, Karw. (*E. jacquiniflora*, Hook.) which I have watched very closely in my greenhouse this winter. Several days before the stamens burst through the involucre, which closely invests them, the pistil, with its ovarium on the long pedicel, has protruded itself beyond, exposed its stigmatic surfaces, and received the pollen from the neighbouring flowers. The way in which the pollen scatters itself is curious. In most flowers a slight jar or a breath of wind will waft the pollen to the stigmas, but I have

not been able to notice any to leave these flowers in this way; for as soon as the anther cells burst the whole stamen falls from its filament-like pedicel, and either drops at once on the pistils of other flowers, or scatters its pollen grains by the force of the fall.

This *Euphorbia* also furnishes another contribution to the theory of sex which I have advanced. The plan on which the male and female organs are formed is evidently a common one; and the only reason why some flower heads have a pistil in the centre, and others are wholly staminate, is, that there is greater *axial vigour when the female flower is formed*. Whenever the common peduncle (below the scarlet involucre) is weak, a pistil never appears in that head of flowers. A few which seem strong neither have them, but the great majority of the strong peduncles are those which bear the female blossoms. Another interesting fact is, that the number of male flowers is less in those heads which also bear a female, than in those which are wholly staminate. This seems to add to the point I made in my paper on *Ambrosia*, that after the flowers have been partially formed in embryo, and before the sex has been finally determined, the female flower, being primordially the stronger, has the power of absorbing the males, or their partially formed elements, into its system. It is certainly remarkable that in both these instances the number of male flowers should decrease in proportion to the existence or vigour of the central female one.

The male and female flowers of *Euphorbia fulgens* are formed much alike. The female occupies the centre, and seems really but a prolongation of the main stem, on the top of which is an articulation from which the ovarium springs. The capsule readily falls from this articulation when mature. From the base of the female central peduncle spring weaker peduncles, colourless, appearing indeed almost like filaments, articulated at about the same height as the female, only above the point bearing a short filament and anther—the caduceous part before referred to. No one can fail to see the correspondence of plan in these different parts, and I think that nothing but the favourable position in the direct line of axial vigour made the central flower a female one.

Cases occasionally occur in which a tolerably strong head of wholly male flowers will develop the central axis into a pedicel almost as long and vigorous as those which bear female flowers. But the flow of vital force—if I am correct in using this term—not being quite sufficient, the final goal of natural perfection in the female form was not reached. These cases do not occur often, but are well worth looking for, as they show so clearly the dividing line between the forces which govern the male or female sex.—THOMAS MEEHAN.—(*Proceedings of Academy of Natural Sciences of Philadelphia.*)

NOTES AND GLEANINGS.

THE SOIRÉE given by the DUKE OF BUCKLEIGH, PRESIDENT OF THE ROYAL HORTICULTURAL SOCIETY, will take place at South Kensington on Wednesday next, July 13th, and not on the 30th, as stated in our last number.

— THE following arrangements have been made for the OXFORD MEETINGS of the ROYAL HORTICULTURAL SOCIETY:—

“Contemporaneously with the Society’s Provincial Show, which is to take place in the grounds of the Observatory at Oxford, it is intended to hold a general meeting of the Society. At this meeting an opportunity will be afforded for the election of new Fellows; and the most remarkable novelties exhibited will be made the subject of comment. This general meeting will be held on Wednesday, July 20th, the chair to be taken at one o’clock.

“Additional meetings will be held on July 20th and 21st for the reading and discussion of papers on subjects of horticultural interest, after the manner of a congress. The gardeners of the United Kingdom, as well as other persons interested in horticultural pursuits, are invited to attend, and to take part in these discussions. Ten minutes will be allowed to each speaker. At these meetings the chair will be taken punctually at 2 P.M. Those who have the intention of speaking upon any of the subjects to be brought forward, are requested to communicate with the Society’s Floral Director, Mr. Thomas Moore, of the Chelsea Botanic Garden, who has been good enough to undertake the organisation of these meetings.

“On Friday, July 22nd, the special prizes will be distributed by the Lord Henry Gordon Lennox, M.P.

“*South Kensington, London, W., June 29th.*”

PROGRAMME OF THE CONGRESS MEETINGS.

Wednesday, July 20th.—W. Wilson Saunders, Esq., F.R.S., in the chair.

1. Dr. Voelker, F.R.S., member of the Society’s Scientific Committee, will give a short lecture on “The Principles of Manning.”

2. Mr. William Ingram, gardener to his Grace the Duke of Rutland, K.G., at Belvoir Castle, will give a short lecture on “The Distribution of Soils, and their Influence on Vegetation.”

Thursday, July 21st.—Major Trevor Clarke in the chair. The following papers will be read and discussed:—

1. Professor Lawsee, M.A., F.L.S., “A Short Account of some of the mere Eminent Oxfordshire Botanists and Gardeners.”
2. Rev. S. Reynolds Hole, M.A., F.R.H.S. “*Roses.*”
3. Mr. William Paul, F.R.H.S. “On Colour in the Tree Scenery of our Gardens, Parks, and Landscapes.”
4. Dr. Hogg, F.L.S., Pomological Director R.H.S. “On Judging Fruits.”
5. Mr. Thomas Moore, F.L.S., Floral Director R.H.S. “On Judging Plants and Flowers.”
6. Mr. Benjamin S. Williams, F.R.H.S. “On Pitcher Plants.” Illustrated by living specimens.

— We have to direct attention to a notice in our advertising columns of an important sale which is to take place at Mr. Stevens’s Rooms, King Street, Covent Garden to-morrow (July 8th); it is that of a valuable collection of stove and greenhouse plants from the Royal Horticultural Society’s Chiswick Garden, whence they must be removed in consequence of the alterations about to be made.

WORK FOR THE WEEK.

KITCHEN GARDEN.

ENDEAVOUR to plant a good breadth of *Celery* forthwith. What is called the Scotch plan of planting—viz., in beds from 4 to 6 feet in width, is that generally considered preferable. These beds, which usually succeed crops of Peas, are trenched two spits deep. The bottom spit has plenty of raw manure or half-decayed leaves, and the top one old manure. The principle points in growing very tender and crisp *Celery*, irrespective of size, is to sow it rather late, and grow it very quickly by means of plenty of manure and moisture. Let a good planting of *Leeks* be made directly, using as much manure as for *Celery*. *Shallots* inclined to ripen should be raised slightly with a Potato fork, in order to admit air to counteract mouldiness. Let a good breadth of autumn *Turnips* be put in without delay, choosing for the kitchen garden the Dutch or Stone.

FRUIT GARDEN.

Birds at this season are troublesome, and it requires netting in abundance to preserve fruit from their ravages. As the fruit is gathered from the earlier Cherries remove the netting, which may serve for protecting later crops. Look over Peaches and Nectarines, and in tying-in the young wood see that the fruit is not too thick. Nailing-in the current year’s wood, and stopping such shoots as are not required for fruiting, are the principal things now to be attended to in this department. It may, however, be advisable to go over such trees as are over-luxuriant, and stop about half the shoots, beginning, of course, with the strongest; for a general stopping at this time would probably be of little further service than to induce the production of a mass of useless spray, whereas stopping the stronger shoots of trees which incline to grossness will divert the sap into the weaker shoots, which will be strengthened, while the buds on the shoots that have been stopped will become full and plump without starting into growth. Should it be found that the roots after stopping incline to start into growth, it will be advisable, as soon as the fruit is gathered, to open a trench at a moderate distance from the stem of the tree, cutting the strongest roots. This may be of the greatest service in checking growth, and will probably do more towards securing ripe wood than anything else that could be adopted. Let the Strawberry plantation intended to stand for next season be trimmed as soon as convenient, cutting off the runners, so as to afford the leaves plenty of room.

FLOWER GARDEN.

During the present continuance of bright weather, frequently examine shrubs transplanted this spring, especially on gravelly soils, to see that they are not suffering from want of water. Give a liberal soaking where necessary. Bedding plants must also be duly attended to with water. As open ground and shrubberies are much more frequented by company at this season than at any other, pay more attention to keeping the greatest neatness and order in every part where there are hands to admit of it. Flowering shrubs as they go out of bloom should have the dead leaves, &c., removed, and be slightly cut back. For the same reasons remove the seed pods from *Rhododendrons* and *Tree Paonies*. Such attention will be followed by an increased growth of the plants, and there will be a greater chance of their blooming every season. The most

forward Carnations and Picotees may now be layered. The layers should be made in light soil, consisting principally of leaf mould. Those shoots which apparently will not become sufficiently strong may be taken off and treated in the same way as Pink pipings. Take every opportunity of fertilising blooms for seed; do not cross a Picotee with a Carnation, and prefer flowers which have a broad, stout, well-formed, and smooth petal. The risk is considerable, even under these circumstances, but the gratification arising from the production of one first-rate flower repays all the trouble. Remove all misshapen blooms of Dablias, and place neat stakes round the main stem, to which the lateral shoots may be attached, otherwise they are apt to be twisted off by high winds. Occasionally examine the pipings of Pinks which are under hand-glasses; remove any that have contracted mouldiness, and carefully extract all weeds from amongst them. Tulips may now be taken up; store them in cabinets with the drawers properly numbered, or put them in thin paper, allowing them to dry gradually in an airy, shady place. Hedges should be well cut-in with shears, unless when formed of large-leaved plants, as Laurel and Turkey Oak, when the knife only should be employed, as the leaves look badly when clipped with shears.

GREENHOUSE AND CONSERVATORY.

Large climbers, with other specimen plants of considerable size, are liable to become pot-bound, and as it is not always expedient to give them a thorough shift, it is a very good plan to sink the pot in another which is somewhat larger. The pot selected should be thoroughly drained, and fibrous heath soil and loam in lumps, with charcoal and pounded crocks, should be laid over the drainage before placing the pot. The rim of the pot inserted may be elevated about one-third of its depth above the level of the exterior pot. This will give room for the prepared compost. After placing it perfectly level the space between the two pots may be filled-up with the same coarse materials. This space affords a good chance of introducing stakes or trellising without injury to the roots. The plants should be fed with liquid manure during the growing season. Camellias may be shifted at this period. It is considered an excellent plan to perform this operation the moment that the flower bud is decidedly formed. As compost, use two-thirds of fibrous loam of an unctuous character, and one-third of fibrous heath soil. The more fibrous and lumpy it is the better; and a good sprinkling of charcoal in small masses, with sharp silver sand, should be added. Let the pots be completely drained by placing some large crocks in a very hollow position at the bottom, topping these up with a pounded mixture of broken pots and charcoal, from which all the very small particles have been riddled. Cover this with very fibrous turf in small lumps before placing the ball, and keep pressing the material—not ramming it—closely with the fingers during the process of filling-up. Have the compost in a mellow state, rather inclining to dryness. One most material point is, to see that the ball is thoroughly moistened before shifting; if any doubt of this exist let the ball be steeped in water for a quarter of an hour previous to potting. Some of the *Staticas*, as *sinuata*, *puberula*, &c., exhausted with blooming, may be shaken out of their pots and repotted. These plants delight in an open compost with thorough drainage, and some of them are partial to a close and moist atmosphere. Stop gross shoots of greenhouse *Azaleas*, and see to cuttings of the best *Pelargoniums*. Continue to pinch off all blossoms from pot *Roses* intended for flowering in November and December, and stop all luxuriant shoots. Young stock of these for winter work should now have their final shift.

STOVE.

Some of the *Bletias*, as also the old *Phajus grandifolius*, are well adapted for producing winter flowers. Such should have their growth completed with all possible rapidity; they enjoy abundance of liquid manure. Occasionally stop the shoots of some of the young plants of *Euphorbia aequiniflora*, they will produce a succession of later blossom.—W. KEANE.

DOINGS OF THE LAST WEEK.

We had on the 1st of the month a few showers which refreshed the foliage of plants and cooled the surface of the parched soil, though they did not reach the roots nor replenish reservoirs. We took advantage of the shade to plant out a quantity of *Brussels Sprouts*, *Scotch Kale*, and *Cauliflowers*, drawing drills, and planting in the drills after puddling the roots, and watering

with sewage immediately afterwards. The plants now look established. We should have liked to have planted out much more, but we have no ground at liberty, all of it being crammed until we can get some *Pea* and *Strawberry ground* empty. It is comparatively easy gardening when a quarter or two can be found empty for winter *Greens* and spring *Broccoli*. Contrary to our custom we have planted *Brussels Sprouts* and other *Greens* in the place which had been filled, up to within a few days, chiefly with *Scotch Cabbaging Kale*—that and *Veitch's Dwarf* being about the best, the *Cabbaging Kale* yielding fine gatherings of soft and tender shoots to the end of June, and making a change with *Cauliflowers* and *Cabbages*. Nothing beats them, except the sprouts from *Coleworts* that have stood all the winter, and the most compact *Cauliflowers*. These shoots from the *Coleworts* were far before the most crisp young *Cabbages*, though they, too, were very good. The *Coleworts* filled the north side of a sloping bank, and they looked so well and lasted so well, that instead of removing them we planted *Potatoes* between them; but we fear we left the *Coleworts* too long for the good of the *Potatoes*, as the ground was too much exhausted as well as shaded at first. However, we expect that with surface-stirring there will still be a moderate crop of *Potatoes* to come in after the early ones on the south side are done, which as yet have yielded unusually well, are quite ripe, and will be lifted for the sake of room. We mention this merely as a sample of the way in which many of us must crop. Even *Cauliflowers* planted 2 feet apart in rows must generally have a crop of *Radishes*, *Spinach*, or *Lettuce* between them.

As to the piece planted with winter *Greens* after having carried such a heavy crop of the same kind, though contrary to our general practice of rotation of cropping, the plan may be adopted at times with impunity. In a neat little garden which has been noticed in these pages, we much err if one border has not carried a crop of *Brussels Sprouts* for more than twenty years, and done it well all that time. We presume it would yearly have a dressing of manure. We put a fair allowance on our piece, and trenched it over to from 18 to 24 inches deep, mixing the manure with the soil, instead of turning it in at the bottom. The trenching was fully confirmatory of what has been recently stated of plants, when established, drawing up moisture from beneath. The roots of that fine plantation had gone far down for moisture. To the depth of nearly 2 feet the soil was the driest we ever saw, so dry that even the lower spit would scarcely lie on the spade, but was inclined to fall off like so much kiln-dried sand. We made holes with a pickaxe, and found vigorous roots of the old *Kale* 3 and 4 feet from the surface, clasping the dampish clay. So dry was the soil near the surface, that but for adding the manure, we should have been inclined to have made holes with a crowbar without digging, and watered the holes before and after planting. In such loose, fresh-turned-up, dry soil, it would be next to impossible to firm plants properly, and, therefore, the surface was well trodden, and then heavily rolled, before the drills were drawn for planting the young plants.

People would save themselves much uneasiness if they would but recollect, that plants fully established will get moisture from beneath, or send their roots down in search of it. We all know that a dry summer generally yields us the finest crops of *Wheat*. This is not because the roots can do with so much less moisture; but because the drier and warmer atmosphere snits the plants, and the roots obtain moisture from beneath. We have carefully traced the roots of *Wheat* to more than 3 feet in depth. We believe that others more careful have found them deeper than that, though *Wheat*, perhaps more than most plants, rejoices in a firm, consolidated soil.

It is with fresh-planted-out plants that the chief difficulty is to be found where there is scarcity of water. It would be of little use transplanting *Lettuces*, for instance, unless you could water and shade; but taken on the whole, our *Lettuces* sown thinly in well-stirred soil, and thinned out early, have been as crisp as usual, and have stood pretty well the usual time before showing the flower stem.

Some remarks have been made about our speaking of *paraol Cabbage* leaves in such a season as this; but as an evidence of what can be done in a holding soil, and giving the plants the full chance of catering for themselves as regards moisture, we may mention that on measuring a number of the larger leaves near the base of the plant we found them average 18 inches in length and 20 inches in breadth. These plants had one watering (a moderate one) of house sewage. We know the ground will be a mass of roots to a considerable depth. This *Cabbage* is a very good early kind. We obtained the seeds from Mr.

Cannon, of Hitchen, who grows largely for sale, and is quite as distinguished with his fine Broccoli. We believe it is chiefly owing to his practical treatment, giving ground entirely to the Broccoli crop, and having his plants a yard apart every way. This is a very different thing from many gardeners, who must continue to get Broccoli when the young plants are smothered and drawn up lanky when growing between Peas and other crops. If a tradesman finds it so remunerative to give such a free space to his Broccoli, is not this an argument, where fine vegetables are desired, to give the gardener the ground to grow them in? But to return to the parasol-leaved Cabbages. Fine as they are, they might be too large for some of our readers who have but little ground, and to them we can safely recommend Veitch's Matchless. It very soon forms a heart, though of small size. We have measured the leaves, which stand rather upright, and find they would average about 8 inches by 7, with a nice compact Cabbage in the centre. Such a compact kind will thrive well in rows 16 inches apart, and the plants 12 inches from each other in the row. This kind also yields second and third crops very freely. Of the larger sort alluded to—a regular fill-basket for a large establishment, the young Cabbages are coming so freely from the stumps, that we shall be tempted to give them a sewage-watering at the first opportunity. Unless the winter proves very severe, our spring Cabbages generally yield profuse gatherings until April in the following year.

The seed leaves of our first-sown Cabbages are just coming through the ground. We shall sow again about the time this is printed. The ground turned up very dry. It was left a little rough, and well soaked with sewage. When it became drish on the surface it was levelled down, the seeds (red-leaved) were scattered over it, beaten in with the back of a clean spade, and then covered with from one-eighth to a quarter of an inch of riddled dry soil, left dry and open. The seedlings looked very well when they came through it. A little charcoal dust is an excellent material to mix with the dry surface covering. Thus securing moisture beneath is far better than surface waterings, which cake the surface and interfere with the seedlings supplying themselves with moisture from beneath.

Early Peas.—Sowed some rows of early Peas, and if the weather promises to be fine will make one sowing more. With the early kinds, so far as earliness is concerned we have no fault to find. Sutton's Ringleader is good, and so is Carter's Early and Chater's (of Cambridge) Early. Of all such, with us Chater's was the most prolific, but though all earlier for a week or so, none yielded like a good sample of Sangster's No. 1. We hope our seedsmen will keep that sort true, as in crowded gardens it is almost impossible to do so. Times were when seedmen would send half a dozen kinds by name out of the same bag, and we fear that Sangster's will have a chance of being lost, an earlier sort being sent instead that would not yield a fourth of the gathering—a matter often of more moment than a few days' earliness in picking. Dickson's Favorite is a fine second early Pea, and our young Peas taste well, though the haulm is getting mildewed.

Mildew.—This has led us to note a little matter, though it may afterwards prove to be of small moment. All our earliest and second early Peas that showed signs of mildew were sown in drills in the usual way. The drills were rather narrow at the bottom, being drawn out with the hoe in the ordinary method, and the Peas sown quite thickly enough in the bottom of the drill. The second early and succession Peas—that is, those coming into pod, those coming into bloom, and those younger, as yet green and flourishing, and showing no signs of mildew, were sown in the old-fashioned way we used to practise many years ago, and renewed again of late, and more especially this year, when signs of a dry season began to appear. The ground was well dug and pulverised, and where possible moderately enriched. A narrow trench the width of a spade was then thrown right and left, say 4 inches deep, a little rotten manure was thrown over its bottom, and just lightly forked in; the bottom of the shallow trench was then trodden and well watered. In an hour or less, if the sun was bright, the points of a fork were just drawn along the watered bottom to make the surface a little open and rough, and then the seeds were scattered thickly over the sunk space, say 7 inches wide, the seeds ranging from 1½ to 2 inches from each other. The seeds were patted down with the back of a clean spade, and covered with nearly an inch of the dry soil from the sides. Peas so treated, even in this dry summer, have as yet shown no mildew, and no great signs of distress.

FRUIT DEPARTMENT.

We did much work in shortening the shoots of fruit trees, as referred to last week, and gathered a large quantity of Strawberries and Raspberries for preserving. If we have rain or can water freely, there will be plenty more of both. Our house-keeper tells us she never before had Strawberries that stood so well to bulk and remained so firm. No doubt this was owing to the sun and dryness leaving little moisture in the berries. We know of many instances in which the makers of Rhubarb jam complained of the hardness of the Rhubarb stalks, but now they are forced to own that they never had such rich and firm jam and jelly before—there was so little watery juice in the stalks. We must think of taking off Strawberry runners for forcing next season. Cherries on walls this season, unwatered and unsyringed, are very good; Cherries on standards in the open have been smaller than usual; Cherries in pots in the orchard house have been fine, because to these water must be given or the plants would die.

ORNAMENTAL DEPARTMENT.

Here our chief work has been switching the lawn with the Daisy knife to remove Plantain stalks, a few Daisies, some flowers of Dutch Clover, and yellow blooms of the Lotus corniculatus. The lawn is a little brown, but a good shower would make it green. Clipped the sides of walks, and swept and rolled to give a fresh smooth surface. A few dull days would give us more growth in the beds, and then there would soon be masses of bloom. Watered Roses with sewage water. They much like it if not too strong. The wood is now in good order for budding, and we know no more delightful work for the amateur and the cottager to engage in. In most gardens of any size where the labour power is always at full stretch, it will be most economical in every way to obtain supplies from our great Rose growers. The regular budder, from practice, puts his buds in with a rapidity and a certainty that mere casual budders might look on with astonishment.

Bedding plants have now obtained good hold, and mostly must cater for themselves. The showers encouraged us to turn out lots of Asters, Stocks, Wallflowers, and annuals. Firmness in planting is a great point in such a season as this—in fact, in any season. When the dibber is used it is the one oblique stroke that fastens the roots securely. When the trowel is used for a plant with a ball, the chief error is to attempt to fasten the roots by pressing downwards, which is apt to disarrange and destroy the roots. The right way is to make the hole large enough, and to press the finely-pulverised earth to the ball laterally. When this is done, water well, to settle all the roots in their places, before quite finishing at the surface.

Much has been done in pricking off and potting Chinese Primulas, Broomallias, Cinerarias, and potting and repotting Balsams. The Cinerarias, fresh potted in small pots, were placed under glass in a cold frame, with its high side to the south, as they will want less water than if they stood out of doors.

Much has been done in repotting, and here we met with several instances where the plants did not seem to be right, and yet the modes detailed the other week for knowing whether a plant was damp enough at the roots had been tried without avail. The surface and bottom of the ball were quite right as respects moisture, and so was the ball for about 2 inches deep all round; therefore, though we had suspicions that part of the roots were dry, the suspicions were lulled by the dull sound that came from the pot when struck. The truth is that the outside of the ball was moist enough, and contained fine, healthy roots; the inside of the ball was dry. To make it wet without repotting, it would have been necessary to have made small holes, or to have set the pot in water. In our case, after getting rid of a lot of the old soil, the ball was set in water until the centre was thoroughly moistened. Very likely these plants had been potted last, when the ball was comparatively dry. This would account for the surface and the outside of the ball being moist, whilst the centre was so dry. There is no more common error—none that ruins pot plants more than this—potting them afresh whilst the soil of the old ball is dry. No common watering will ever thoroughly wet that dry soil again; the moisture given will always escape by the looser soil at the sides. Make sure, then, first of all, that the ball of a plant is sufficiently moist before placing it in a new and larger pot. And once more, in repotting use soil neither wet nor dry—wet enough to retain the marks of your fingers when you squeeze a handful tightly, dry enough that that handful will fall to pieces when you lay it down on the

potting-board. If wetter, it may be too compressed to allow water to percolate freely; if drier, there is a great difficulty in common watering to get the whole regularly moistened.—R. F.

TO CORRESPONDENTS.

•• We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

BOOKS (J. W., Liverpool).—“Fruit Gardening for the Many” contains all you require about Strawberry culture. You can have it from our office, post free, if you enclose five postage stamps with your address.

TENANT REMOVING SHRUBS (Yorkshire).—You have no legal right to remove shrubs or plants from the garden, although they were inserted and have been cultivated by yourself for seven years. Cannot you divide each plant, put one part in a pot, and leave the other part? The potted portions you might take away.

MEASURING GLAZIERS' WORK (A. W.).—Unless specified to the contrary, glazing by the foot is measured on the square—that is, the greatest length and breadth; at least that used to be the case. The true measurement of angles and triangles, as ends and corners, would only be half a square; but a glazier could not do it on such measurement, he would have such a waste of glass in the sharp angles. No doubt this makes the difference in the number of glazed feet. Circular-topped windows are measured the same way—by the square.

MISTAKES AT LOCAL SHOWS (E. G.).—We cannot spare space for recording such mistakes. You should write to the Committee.

GALVANISING PLANTS (A. D.).—The experiment with the two Pelargoniums was too imperfect to merit reporting. The results from half a dozen galvanised, and half a dozen ungalvanised, with proper precautions, would be more worthy of confidence.

SEEDS FOR ARKANSAS (Pangbourne).—They will need no special packing. In small paper packets will be the best form. Any seeds that will succeed in England will succeed there.

PELARGONIUM—LOBELIA (S. Kidley).—The box was smashed. There was no Lobelia, and only a few petals of the Pelargonium. Their colour and markings are not uncommon.

ZONAL PELARGONIUMS (Quara St.).—We cannot recommend dealers. Any of the principal ferists who advertise in this Journal could supply the varieties you name.

SEEDLING PELARGONIUMS (W. O. B., Dublin).—The petals were nearly all shed, and the box smashed. There are many Pelargoniums with similarly coloured and marked petals.

SEEDLING TRICOLOR PELARGONIUM (E. Shepton).—It is handsome, but the leaf sent was precisely like *Sophia Dumasques*.

PANSY DISEASED (E. M.).—The cuttings of the Pansy reached us safely last week. The yellow spots are the fungus *Oidium Viola*. A hybrid between a Fern and Pansy is an impossibility, as cryptogamic and phenogamous plants have no affinity. We do not remember receiving Pansies previously.

ROSE LA SÉDUISANTE (Centurion).—We do not know a Tea-scented Rose of that name, but there is an old Hybrid Perpetual as well as the Alba Rose. Most probably it is the Hybrid Perpetual that you have. You must wait for the flowers.

CHARCOAL FOR ROSES (J. B.).—It is a good manure for Roses both in pots and in the open ground. One-sixth of the compost is sufficient for Roses in pots; and for giving colour to the flowers it may be applied to the surface of the soil in the pots, and just scratched in with a piece of pointed wood. If the surface be covered about an eighth of an inch deep it is sufficient. For those in the open ground a dressing a quarter of an inch thick is not too much.

BRUSH FOR KILLING THE ROSE APHIS (W. T. D'r.).—We have used the brush you speak of to remove green fly from Roses, and find it useful but rather tedious. If Roses are well mulched and manured during the winter they will very seldom suffer much from aphids. We do not quite know whether your Rose plant which had its leaf perforated suffered from the weevil or the Rose Cutter beetle. If from the former, handpicking would be quite effectual; if, as we suspect, it was the latter, you would have done no good by cutting down the plant, as the Rose Cutter beetle merely cuts the leaf to take it away to line the sides of its nest, and when the nest is complete will commit no more ravages. Singularly enough, these beetles generally confine their attacks to one plant; they usually select a plant with stiff short foliage, and the nest will be found in a small hole in the ground near the tree. The Rose Cutter beetle always begins its perforation at the outside of the leaf, and cuts a semicircular piece out of the side.

BOILERS (L. C. J., Dudley).—We never venture to commend any.

MANURES (H., Tunbridge Wells).—You do not quote accurately. We recommend dry earth and coal ashes to be used when saturated with sewage, which has to be stored. Coal ashes so employed would not be injurious to any soil; and if the soil be tenacious they would be beneficial employed even in large quantities unsaturated with sewage. They would improve the soil's staple.

PARSLEY TURNING BROWN AND YELLOW (“*Idem*”).—But for being brownish yellow, the specimens of Parsley sent seem to be a fairly good curled, close kind. This turning yellow might be owing to the great dryness—most probably owing to some reason of which we are ignorant. As it is best to err on the safe side, and as defects are easily perpetuated, even if the plants would ripen their seed, we should not care to sow it, unless as an experiment, as such withered-looking Parsley would never be used in the kitchen.

HEATING A REMOVABLE HOUSE (T. M. L.).—Such a span-roofed house as you propose we would build entirely on the ground, with perhaps one course of bricks for the window-sill to rest on. The roof, &c., we would form of rafter sash-bars, say to receive glass 18 inches wide. These bars we would groove to receive the glass edge to edge without putty, and merely fasten the squares in their places with small list, soft cord, or rope yarn, fixed in the groove beneath the glass. Provided the groove is made deep enough to allow room for the glass to expand, there will be no breakage from expansion, and if the glass is well cut there will be no leakage. The bottom square will require a pin to keep it from sliding out. With the roof screwed, and these squares in place, you can take all your glass out, and the house to pieces, and pack in little space. As to heating for ease in moving, nothing could be better than a small gas stove; but as, on the whole, you might not have gas at your next place, it would on the whole be best and cheapest to have a small iron stove fed at the side, the smoke-pipe coming from the opposite side, and rising with a bend through the roof, with a flat top to the stove to receive a vessel of water. Supposing the stove stood in the centre of the house, the small smoke-pipe from it might go through the roof near the apex. A 3 or 4-inch pipe would answer if frequently cleaned. People cannot, or will not, see how easy it is to take such a pipe through a glass roof; all you have to do is to substitute a square of plate iron for a square of glass, with a suitable hole in the iron to let the pipe through. The pipe should have a cap over it outside, to prevent the rain and snow falling into it. If you prefer a gas stove—and there are good ones to be had with argand burners that consume almost the whole of the gas—even in such a case have a small pipe, if only from a quarter to half an inch, to take off the products of combustion into the open air.

RAISING WATER (Edmonton).—The best reply we can give is to publish the following, for which we are indebted to our weekly contemporary, *The English Mechanic and Mirror of Science*. The accompanying drawing will explain a cheap method of making a force pump for watering. One has been in use some time. A, common lead pipe; B, valve; C, solid plunger from pump; D, outlet pipe; E, small cask, or any suitable air-

tight vessel holding about 6 gallons; F, valve; G, outlet pipe, reaching to within about 2 inches of the bottom; K, guide for plunge-rod. It can now be used as a common pump by having a union; an india-rubber or any other pipe may be screwed on, and there would be sufficient force to carry a continual stream 60 feet high. The cask, or air-tight vessel may be placed at any distance from the pump; a round hole in the bottom, with a piece of stout leather weighted, is all that is required for the valve."

FAILURE IN HEATING (Inquirer).—We are glad you refer again to flue-heating, as instanced at page 191, No 467, for March 10th. It seems we were quite right in our surmises. No flue will draw regularly with the furnace-bars level with the middle of the flue, as respects its depth, and we wonder you were not smothered from the want of a regular asphit below the fire-bars. Your proposal to let the present flue remain, but block it up; let the fire-bars remain, but break a hole through the present flue at the end of the furnace; and place a flue of hard-burned earthenware pipes of 9 inches in diameter on the top of the present flue, will, no doubt, answer much better. But even then your furnace-bars will scarcely be low enough, and instead of a foot you would require to build a brick flue from 1 to 2 yards in length on the top of the old flue before using the pipes, as such pipes are apt to crack when too near the surface. We have a great sympathy with people wishing to carry out their own plans. We do not, therefore, repeat our advice, "Try the flue again," for as it is, it will not answer, but as the flue is there, why not "try it again" with a little alteration? Would it not be easier to dig down and sink your furnace-bars from 18 to 24 inches, instead of making this new flue on the top of the old one? Then, instead of the bars being in the middle of the flue as now, your bars would be below the bottom of the flue. However, try your own plan if you like it best.

ICE HOUSE (J. D. Whithead).—All ice houses, as a rule, keep ice best in proportion to the quantity of ice put in. A few loads, however protected, will seldom last after midsummer. We know the plan of Cobbett's you have adopted answers well, but, of course, the smallest opening would be ruinous, and it would be of no use where rats or rabbits could burrow in the straw, as every hole made would let in the heated air. Ice stacks, if looked after, and from fifty to a hundred loads put together, answer well, as described at the page in the "Gardeners' Dictionary" you refer to; but even in their case, holes from vermin must be looked after, and the covering must be put on so as not to heat. We have ourselves no doubt that a house on Cobbett's plan, either above or below ground, with double walls and double roof, with a space, say of 6 inches between, would answer well, as if made of brick or stone there would be no air holes easily formed, as there is almost sure to be in most districts where gnawing and burrowing animals abound, and the walls are wood and straw. See article in No. 304, vol. xii., page 64.

SPAN-ROOFED FRUIT HOUSE (J. Reader).—We have given plans and descriptions of cheap houses, and there are advertisements in our pages which may be referred to and depended on. You can do better for yourself, knowing the circumstances in your own neighbourhood, than we can do for you. For instance, a fixed roof could be put up for less than the half of one with sashes, and the heating for such a house will be very different, if you want Grapes ripe in May, than if you were satisfied to have them in July and onwards. Peach trees for the centre of the house you could purchase at 1s. 6d. per plant, and yet it might be true economy to have plants at from 7s. 6d. and onwards. In such a house, 20 feet wide, and glass all round, eight 4-inch pipes the length of the house would not be too many to have Grapes ripe in the beginning of May. The Grapes that would come in best then would be Black Hamburgh, Sweetwater, and Royal Muscadine; and if you wish to give a chance to the Peaches in the centre, six or seven Vines on a side will be enough. An upright tubular boiler is rather the easiest to manage, but otherwise there is no great difference between that and a terminal saddle-back. The price of shelving and fitting up depends much on the material used, and altogether your case is one more for local inquiry and agreement than could be satisfactorily entered largely upon in our pages.

PLANTING WHOLE POTATOES (Calcearia).—We approve of this practice. Let us know the quantities produced by you and your neighbour, and we will publish the same with notes.

LAWN COVERED WITH DAISIES (W. F.).—To destroy them you acted judiciously in top-dressing the whole lawn with a mixture of good loam and well-rotted dung, and in April sowing the whole with a suitable mixture of grass seeds. If you let the grass grow long, in a season or two it will probably choke the Daisies. To prevent the Daisies ripening their seeds, take the flowers off with the Daisy rake. If you do this, and have the roots of the survivors scooped out with a knife in the autumn and spring, you will subdue them entirely.

ANTHRUM SCHERZERIANUM, TEMPERATURE FOR (S. E.).—This beautiful plant requires at this season a temperature of from 65° to 70° at night, and 75° by day without sun, and from 80° to 85° or 90° with sun and air. It does very well in the stove during the summer.

INCREASING ANTHRUM SCHERZERIANUM (X. O.).—Your best plan of inducing your plant to form offsets will be to give it a more moist and warmer atmosphere, as well as every stimulus to growth, and thus, no doubt, you will have a larger plant, but not so many flowers. The taking out of the crown of the plant—just its centre—would be likely to afford an increase of the crowns.

MELON TREATMENT (J. F. S.).—The lights should not be covered after May. It is only so long as the nights are cold that coverings are needed. When the nights are becoming cold in autumn it is essential to cover the lights as in spring, but it will not be necessary to do so before the close of September. The bed should be lined as may be found necessary for maintaining the proper temperature. During the very bright weather we had a short time ago it was not necessary. If the temperature at 6 A.M. is 65° no linings are required; with us it is often under 60° at night, and we have Melons now in beds made up but a short time before yours, and the beds have not been lined more than twice. Melons will endure a great amount of heat. 85° to 90°, however, with sun and abundance of air, is quite sufficient, but they will bear from 100° to 110° without injury if they have air. It must, however, be from sun heat. We would now line the bed with sweet dung, give a good watering, but without wetting the surface, by pouring water through a funnel or drain-pipe, and by giving plenty of air we think the fruit will set. The flower is all right.

CULTURE OF BLACK CURRANTS (J. Poor Lady).—We do not think it would answer to prune the bushes now, cutting them back in the hope of obtaining shoots for next year's bearing; but it would be of great benefit to give liberal supplies of liquid manure in dry weather throughout the summer, thinning out the shoots now where too thick. Where very long and straggling they may be shortened, but take care to leave a sufficient number of shoots for bearing next year. The best manure is cow dung, as it is cool, but any kind will answer. Apply the manure in autumn, after the leaves fall, removing the soil down to the roots to the extent of about 2 feet all round the stem; then give 2 or 3 inches thick of manure, and cover with about an inch of soil. The manure need not be more than half decayed. Road scrapings are not of much value; and guano, though it will do good, ought to be applied in moist weather only, and in small quantities at a time.

MILDEWED VINES (C. E.).—We do not see what you can do now, except to dust the mildewed parts with flowers of sulphur, to paint your walls with sulphur and lime, to use a little sulphur in your heating medium, and to give as much air as is compatible with the health of the Vines and other plants. A close moist atmosphere is the fertile source of mildew; the reverse condition keeps it away or starves it. Mildew is often the result of many plants being kept close and damp beneath the Vines. If you do not allow the Vines to be too thick on the roof, we do not think the mildew will much affect them, but the more moisture and closeness there is in the house, the more difficult will it be to eradicate the mildew. We see little use in cutting the Vines down if you mean to take fresh growth from them. Such mildew is, generally speaking, more owing to atmospheric than to root or earth causes.

GRAPES SMALL AND ILL COLOURED (J. F. H.).—We think very likely the smallness of the Grapes, and their colouring irregularly, are owing to the dryness and poorness of the border. If the previous watering is not

enough, water again with manure water. Keep, as you say, a little heat in the house whilst you give air freely; meanwhile, the mere irregular colouring is often no great drawback. When a few berries colour well, the others generally follow suit, if they are firm and perfect.

GRAPES DISEASED (M. D. C.).—They are shranked and spotted also. Remove the soil from over the roots, replace it with some richer soil, and water copiously twice a week with tepid weak liquid manure. The roots are unable to supply sufficient sap.

MILDEW ON GRAPES (Vitis).—Dust them thoroughly with flowers of sulphur. After the sulphur has been on three or four days, syringe the Grapes. If after two more days the mildew is still apparent, apply the sulphur again, and continue repeating the treatment until the mildew is entirely removed.

SULPHURING GRAPES (Centurion).—It is not necessary to syringe the Grapes and Vines previous to dusting them with sulphur for destroying mildew. The sulphur will readily adhere to the Grapes and the leaves of the Vines. There is no necessity for washing off the sulphur; it may remain until the mildew is destroyed, and then be syringed off with clean rain water. If this be done when the Grapes show colour it will be soon enough, though we usually wash off the sulphur within a week, but if the mildew reappears it is necessary to repeat the sulphur-dressing and the subsequent washing. Air should be admitted as usual; if anything, more air should be given after than before the application. Your gardener is quite right in giving all the air possible in bright hot weather, but to do so in cold dull weather will lower the temperature needlessly, and unless fires are put on the warmth needful for ripening the Grapes cannot be maintained. We advise you not to nail up the front and west sashes. It is very important that a greenhouse, and, indeed, every plant structure, should be well ventilated.

LILIUM ATRATUM AND LANCIFOLIUM TREATMENT (C. M. Major).—We consider the best time to repot these plants is as soon as the stems turn yellow in autumn. Cut down the stems, remove all the old soil that comes away freely, and that above the crowns, along with any roots on the stem and offsets, but all the roots below the bulb should be preserved. Drain the pot well, and put in a mixture of light fibrous loam two parts, one part sandy peat or leaf soil, and one part old cow dung or well-rotted manure, with a free admixture of sharp sand. The plants should be so potted that a space of 2 or 3 inches above the bulbs will be left for top-dressing. They should have a gentle watering and be placed in a cool house, and kept there with but little water until they begin to grow in spring; then water so as to keep the soil moist, increasing the supply with the growth. Abundance of air should be given, and if the plants be kept cool they will flower all the better, the top-dressing being given when they begin showing roots from the stem above the crown. The same compost as that used for potting will answer very well. The soil should be kept moderately moist in winter, but avoid souring it at any time by too frequent heavy waterings.

VALLOTA PERPUEA CULTURE (Idem).—We presume your plants are growing freely, but you cannot get them to flower. Having now made a good growth, place them in a light airy position, and give no more water than enough to keep the leaves from flagging, with an inclination to dryness, and continue this treatment up to the end of August, when your plants should be starting for flower; if they do not, continue them in the same pots, and give just enough water to keep the foliage fresh. In winter they merely require a light position in a house with a temperature of from 40° to 45°. In summer they need plenty of light, and a good supply of water when making their growth and until it is perfected, then dryness. An ordinary greenhouse will grow them well.

INSECTS (C. E. E.).—Your "nigger" is the larva of one of the Carabidae, and as it feeds on other insects and worms, you cannot do better than preserve them if you find others. (J. T. S.).—The Beech leaves have been attacked by the minute black jumping weevil, *Orchestes Fagi*, the larva of which lives within the leaf, eating the parenchyma, and making large blister-like blotches. When full-grown it spins a white silken cocoon of the size of a pea at the edge of the leaf. The little beetles are now making their appearance out of their cocoons. They also feed on the leaf, gnawing round holes. (E. Hazard).—Your moth is the Humming-bird Hawk Moth, which has been somewhat common during the last two or three years. It is quite harmless to your flowers. (L. H.).—Your *Cecropia* moth survived the loss of its head on the same principle that the common daddy-long-legs seems so indifferent to the loss of its limbs. The nervous mass is, in fact, in insects not concentrated as in the higher animals into the brain, but is distributed in knots along the whole length of the body. The respiratory apertures along the whole length of the sides of the creature are not connected with the sense of feeling.—I. O. W.

NAMES OF PLANTS (South Devon).—The commonest of Ferns, *Polypodium vulgare*.

POULTRY, BEE, AND PIGEON CHRONICLE.

SPALDING POULTRY SHOW.

In reply to Mr. Patrick's communication last week respecting the loss of sickle feathers in his birds after exhibition at this Show, permit me to assure him that the most careful investigation fails to discover any possibility of such a thing having occurred while they were in the custody of our Committee. Evidently the occurrence must have taken place in transit, and our Committee will gladly add another £5 to Mr. Patrick's to secure the conviction of the perpetrator of this spiteful act, and will take care that the rewards are duly announced in Mr. Patrick's neighbourhood as well as our own. It seems rather strange if, as Mr. Patrick states, the same thing occurred to his birds last year, that he sent them again, and neither at that time nor when sending them this year made any complaint nor remark on the subject. The perpetrator would seem

to have been actuated by personal feeling against Mr. Patrick, as neither at our late nor any of the previous shows have we heard the slightest complaint of any other birds having been injured or tampered with.—EDMD. CAMMACK, *Poultry Secretary.*

THE POULTRY FANCY IN CANADA.

THE other day I noticed the publication of the first number of a new poultry journal in the United States, as an evidence of the growth of "the fancy" across the water. I have just received by mail the announcement of another journal to be published in Canada. The first number is to be published on the 1st of July, under the title of the *Canadian Poultry Chronicle*, but it will also be open to matter relating to Pigeons, birds, dogs, Rabbits, and similar subjects. The paper is to appear monthly, and the subscription price is one dollar-and-a-half per annum. I imagine that the readiest way of remitting subscriptions from England would be a money order for 6s. The address is Box 25, Post-office, Toronto. The embryo journal and its editors (whose names are not yet disclosed), are strongly recommended by several well-known Canadian fanciers, including Colonel Hassard, whose able address, or paper, read to some of the colonial breeders was reported in the Journal some time back.

All eminent breeders should take in both of these transatlantic papers. Apart from all other considerations, I can assure them, from personal knowledge, that the poultry fancy is making rapid strides across the water, and that the American market will offer a valuable and most lucrative channel for the disposal of good surplus stock. I say good, for the exportation of mere "scraws" assuredly will not pay, but will entail both disgrace and loss.—L. WRIGHT.

TESTIMONIAL TO MR. DIXON.

ABOUT two years ago a well-merited tribute was paid to one of our leading poultry judges, and I think the present a well-timed opportunity for a similar mark of esteem to be paid to another gentleman, who is well known as one of the founders of the fancy; who for a great number of years was the leading exhibitor; and who, at present, is one of our most accomplished judges. I think I need scarcely say I refer to James Dixon, Esq., of Bradford.

Mr. Dixon being a gentleman of means, I think the testimonial ought to take some other shape than money, but the exact form can be left for subsequent consideration, and under these circumstances the amount of subscription will be limited to 10s. 6d., but smaller sums will, of course, be received. The amount is placed thus low to enable all classes of fanciers and exhibitors to show their appreciation of his services.—E. HUTTON, *Pulsey, Leeds.*

BEEES ATTACKING CHICKENS.

Your correspondent, Mr. J. Elcome, has inquired whether any of your readers has heard of bees attacking fowls. In 1845 I put a hen under a coop with a large brood of chickens near a bee hive, and they had not been near each other above a day when the bees made a most violent attack upon the chickens, and killed several of them; in fact, I do not recollect whether any of them escaped. It was a warning to me never again to place chickens near a bee hive.—SENEC.

BURNLEY POULTRY SHOW.

THIS was held on June 30th, and was well attended by exhibitors, there being upwards of 280 entries of Poultry, Pigeons, and Rabbits. The following are the awards:—

GAME.—Black or Brown-Reds.—1 and *hc.*, C. W. Brierley, Middleton. 2, J. Brough, Carlisle. *Cock*.—1 and 2, C. W. Brierley, *hc.*, J. Brough. *Any other Variety*.—*Cock*.—1, C. W. Brierley. *Hen*.—1, C. W. Brierley. 2, R. Whittam, Burnley. SPANISH.—1, H. Wilkinson, Earby. 2, W. Bearpark, Ainderby Steeple. DORKING.—1, J. Stott, Healey, Rochdale. 2, W. Bearpark, COCHIN-CHINA.—1 and 2, J. G. Broxup, Burnley. HAMBURG.—*Golden-spangled*.—1, H. Bantam, jun., Earby, Skipton. 2, W. Driver, Keighley. *hc.*, N. Marlor, Denton, Manchester. *Golden-pencilled*.—1 and 2, H. Pickles, jun., *hc.*, W. Clayton, Keighley. *c.*, F. S. Driver. *Silver-spangled*.—1, J. Fielding, Newchurch, Kossendale. 2 and *hc.*, H. Pickles, jun. *Silver-pencilled*.—1, F. & C. Haworth, Newfield, Haslingden. 2 and *hc.*, H. Pickles, jun. *Black*.—1, N. Marlor, Denton. 2, H. W. Illingworth, Idle, Leeds. *hc.*, D. Lord, Stacksteads, Manchester. BRAHMA FOOT.—1, J. H. Pickles, Birkdale, Southport. 2, E. Leech, Rochdale. BANTAM.—*Game*.—*Cock*.—1, Harwood & Buckley, Accrington. 2, G. Harwood, Holdenwood, near Haslingden. *hc.*, J. Oldroyd, Wakefield; F. Jackson, Scars, Brierfield. *Game*.—*Black or Brown-Reds*.—1, T. Barker. 2, J. Oldroyd. *Game*.—*Any other Variety*.—1, Bellingham & Gill, Woodfield. 2, R. Whittam, Burnley. *hc.*, G. Frouess, Church. *Any other variety except Game*.—1, J. Walker, Halifax. 2, H. Pickles, jun. *hc.*, M. Leno, Markyate Street, Dunstable (Golden and Silver-laced). *ANY OTHER VARIETY*.—1, H. Pickles, jun. (Silver Polands). 2, T. Dean, Keighley (Polands). *hc.*, H. B. Smith, Bronzton, Preston (White-crested Black Poland). DUCKS.—*Aylesbury*.—1, E. Leech. 2, M. Wilkinson, Worsthorpe. *Rouen*.—1, E. Leech. 2, H. B. Smith. *hc.*, C. W. Brierley. *Any*

other Variety.—1, C. W. Brierley. 2, S. & R. Ashton, Roe Cross, Mottram, Cheshire (Pintails). *hc.*, B. Conderdie, Brookfield, Littleborough, GEESE. 1, E. Leech. 2, W. Halstead, Cockden, Burnley. TURKEYS.—1, E. Leech. 2, C. W. Brierley.

PIGEONS.

CARRIERS.—1 and 2, E. Horner, Harwood, Leeds. *hc.*, J. Hawley, Bingley; H. Yardley, Birmingham. POUTERS.—1, E. Horner. 2 and *hc.*, J. Hawley. TUMBLES.—1, J. Hawley. 2, J. Fielding. 3, J. Fielding, jun. 4, J. Fielding, jun.; Rochdale. 2, J. Hawley. *Mottled*.—1, J. Fielding, jun. 2, H. Yardley. *hc.*, J. Hawley. BARNS.—1, E. Horner. 2, J. Hamilton, Haslingden. *hc.*, H. Yardley. OWLS.—1 and 2, J. Fielding. *hc.*, W. Buckley, Blackburn. TRUMPETERS.—1, E. Horner. 2, J. Hawley. JACOBS.—1 and *hc.*, E. Horner. 2, J. Hawley. FANTAILS.—1, J. Hawley. 2, J. Kemp, Haslingden. *hc.*, E. Horner. TURBITS.—1, J. Hawley. 2, E. Horner. *hc.*, H. Yardley. ANTWERPS.—*Short-faced*.—1, J. Oldroyd, Wakefield. 2, E. Horner. *hc.*, H. Yardley; J. Parker, Burnley. DRAGONS.—1, E. Horner. 2, J. Hawley. *hc.*, D. Neill, Darwen; H. Yardley. *ANY OTHER VARIETY*.—1, E. Horner. 2, J. Hawley. *hc.*, W. Kitcher, Feniscowles, near Blackburn (Magpies).

RABBITS.

LOP-EARED.—1, W. Slater, Burnley. 2, N. H. Ellis, Accrington. *hc.*, H. Creeke, Burnley. *ANY OTHER VARIETY*.—1, W. J. Butterworth, Stoneyfield, Rochdale. 2, L. Pickles, Birkhouse, Cliviger, Burnley.

JUDGES.—Mr. James Fletcher, and Mr. John Martin.

BEVERLEY POULTRY SHOW.

THIS meeting, held on June 29th, was exceedingly well supported, and the weather being fine and cool, the attendance of visitors was most satisfactory. Perhaps Beverley has never before possessed so good *Game* classes, every colour being represented by fowls of the highest quality. Although the bulk of the *Spanish* had evidently been much taxed by repeated and almost continuous exhibition, there were many of first-rate character. *Dorkings* were good; but one of the best pens was defeated by the fact of the hen being seriously ruptured—a fatal objection to her equally as a show and a stock bird. *Cochins* were unusually good throughout, and the *Hamburgs* and *Polands* were all that could be desired. *Game Bantams* were sadly out of condition, and in *Sebrights* two pens were shown by different exhibitors, in which the cocks were without tail feathers; it is a pity to show birds in so deep moult, as it tends to heavily bear on the constitution, already materially weakened by the natural changing of plumage. The *Ducks* were unusually fine.

The best show of *Pigeons* ever seen at Beverley was that of this year. The varieties most noticeable were the Carriers, Dragons, Almonds, Fantails, and Jacobsins. Of Trumpeters, Turbints, Antwerps, and Nans there was also a very fine collection. The "Variety class" and the Selling class of Pigeons were of high merit. The arrangements were precisely those carried out at the Beverley Show for more than a dozen years past, and, with the exception that the pens for the fowls were placed rather too low, we believe they could not be improved. The Royal Assembly Rooms, in which the Show was held, afford the greatest comfort for both visitors and poultry, and the light is excellent. Once more we strongly suggest to exhibitors, Never trust to the last train, as several most praiseworthy pens were not delivered at Beverley till long after the Show was open to the public.

GAME.—*Black-breasted or other Reds*.—1, W. Boyes, Beverley. 2, S. Matthew, Stowmarket. *hc.*, D. Gellatly, Meikle; G. Holmes, Driffield; C. H. M. Julian, Hull. *Any other Variety*.—1, Cup, and *hc.*, W. Boyes. 2, H. M. Julian. *hc.*, W. Mathew, G. Pombock, Kiryopondale. 3, G. Sutton, Boothby. 4, W. Boyes. *hc.*, H. M. Julian; G. Brentnall, Barton-on-Trent. SPANISH.—1, H. Beldon, Bingley. 2, J. Walker, Wolverhampton. *hc.*, E. Jones, Clifton; Messrs. T. C. & E. Newbitt, Epworth (2). *c.*, J. Smith, Long Leith, Keighley. DORKING.—1, Mrs. F. S. Arkwright, Sutton Sealsdale. 2, J. Stott, Healey. *hc.*, H. Lingwood, Barking, Suffolk (2). COCHINS.—*Cinnamon or Buff*.—1 and Cup, J. Cattell, Birmingham. 2, H. Lingwood, *hc.*, R. White, Sharnbrook, Sheffeld; W. A. Taylor, Manchester (2). *c.*, W. A. Burrell, Southow. *Any other Variety*.—1, W. A. Taylor. 2, R. White, G. White, Whitley, Netherthorpe; J. Sichel, Hamersay.—*Golden-spangled*.—1, W. A. Hyde, Ilurst, Ashton-under-Lyne. 2, D. Maynard, Driffield. *hc.*, H. Beldon (2); J. Newton, Asdn-n, Leeds; G. Garbutt, Sinnington. *Silver-spangled*.—1, Cup, and 2, H. Beldon. *Golden-pencilled*.—1, H. Beldon. 2, G. Holmes, Driffield. *hc.*, H. Beldon. *Silver-pencilled*.—1, and 2, H. Beldon. *Polish*.—1, Cup, and 2, H. Beldon. *hc.*, J. Watts; J. M. Proctor, Hull. FRENGEN FOWLS.—1, Mrs. J. Cross, Brzgr. 2, J. Elgar, Newark. *hc.*, H. Wrenham, Wawne (2). *c.*, J. K. Fowler, Aylesbury. BRAHMA.—1, G. F. Whitehouse, King's Heath. 2, J. Elgar. *hc.*, H. Beldon; H. Lingwood; W. Gamon; Dr. J. Holmes, Whitecotes, Chesterfield. *c.*, J. H. Dawes, Moseley Hall. *ANY OTHER VARIETY*.—1, R. Loft, Wootton Bassett (Sultans). 2, W. Collyer, Dobb, Bingley (Black Hamburgs). *hc.*, H. W. Illingworth, Idle, Leeds; J. Smith. SELLING CLASS.—1, H. Wrenham (Creve-Coeur). 2, T. C. & E. Newbitt (Spanish fowls). *hc.*, W. A. Taylor, *c.*, H. Beldon; G. Loft; W. Boyes. GAME BANTAM.—1, H. Beldon. 2, G. F. Entwistle, Westfield, Cleckton. 3, J. CANARIES.

BELGIAN—1, F. Tritschler, Beverley. 2 and c, W. Needler, Hull. *hc*, J. Down, Beverley. **HALF-BLOOD**—1, G. H. Withington. *hc*, J. Down, c, J. Powell, Beverley. Mrs. Grant, Beverley. **MARKED**—1, R. Jefferys, Market Weighton. 2, W. Bielby, Willow Grove. *hc*, J. S. Petch. c.—Widdall, Beverley. **ANY OTHER VARIETY**—1, A. Lewis, Hull. 2, Miss Young, Driffield. *hc*, Miss E. Canpey, Beverley. c, Mrs. J. Powell, Beverley. **NEST OF YOUNG**—*Clear*—1, T. Neall, Beverley. 2, J. Downs. *hc*, Mrs. Pierson, Beverley. c, J. Canpey, Beverley. *Marked*—1, J. Sykes, Market Weighton. 2, Miss E. Brady. *hc*, Mrs. Pierson. c, T. Canpey. **WOLFEISEN**—1, J. Canpey. 2, Mrs. Potage, Beverley. *hc*, Miss Holmes. **MISS L. HOLMES**. **GOLDEN MILE**—*Variagated*—1 and 2, W. Needler. *hc*, J. S. Petch. *Dark*—1, J. S. Petch. 2, Miss Widdall. *hc* and c, T. Neall. **EXTRA STOCK**—*hc*, Mrs. W. Dale, Beverley (Paroquet); W. Dale, Beverley (Waxbills); G. B. Holmes; Wilson and Sons, Hull; Mrs. Pierson (Cage of Birds). The whole class worthy of prizes.

The Judge was Edward Hewitt, Esq., of Eden Cottage, Sparkbrook, Birmingham.

BARNSTABLE POULTRY SHOW.

This was held on the 29th and 30th of June, in connection with a horticultural show. The prize list is as follows:—

COCHIN-CHINA—1, F. Brewer, Lostwithiel. 2, W. L. Trewin, Barnstaple. **BRABMAS**—1, J. Beard, St. Blazey. 2, Mrs. Smith, Canaple, Tavistock. **MALAYS, OR INDIAN GAME**—1, A. Small, Bishop's Tawton. 2 and c, H. Darch, Stratton. **GAME**—*Black-breasted Red*—1, J. Boyle, Barnstaple. 2, J. Beard. *Any other Variety*—1, Rev. G. S. Cruwys, Cruwys Morchard, Taverton. 2, J. Westcott, Barnstaple. **DORINGS**—*Coloured*—1, W. J. Medway, Newton Abbot. 2, R. Harris. **ANY OTHER VARIETY**—1, R. Harris. 2, J. Woodley, Stratton. **ANY OTHER VARIETY EXCEPT BANTAMS**—1, W. Littlejohns, Piton. 2, W. L. Trewin, Kilkhampton. 3, T. H. Shorton, Falmouth. 4, J. H. Nicholls. **BANTAMS**—*Game*—1, W. Mudge, Blagton. 2, E. M. Webber, Exeter. 3, J. Croote. *Any other Variety*—1 and 2, Rev. G. S. Cruwys. 3, S. Woodman, Barnstaple. c, R. L. Hole, Hanaford. **TURKEYS**—1, A. C. Thinne. 2, Mrs. Smith. **GUINEA FOWLS**—1, T. J. Dennis. 2, O. A. Young, Driffield. **GEESSE**—*Any Variety*—1, E. B. Molecomb, Buckland Brewer. 2, E. B. Molecomb, Bideford. **DUCKS**—*Rouen or Aylesbury*—1, S. R. Harris, Lostwithiel. *any other Variety*—1, S. R. Harris. **SELLING CLASS**—*Goose*—1, S. R. Harris. 2, J. E. Hawken. *Hen or Pullet*—1, F. Brewer. 2, G. H. Gregory, Taunton. *hc*, J. Medway, Newton Abbot.

PIGEONS.

CARRIERS—1, Master C. Bulpin. 2, H. Yardley, Birmingham. *hc*, Mrs. F. J. Bulpin, Bridgewater. **POUTERS**—1, Miss F. J. Bulpin. 2, Mrs. M. G. Bulpin. c, Master C. W. S. Bulpin. **TEMBLES**—1, Master C. W. S. Bulpin, Bridgewater. 2, H. Yardley. *hc*, W. Westcott, jun., Barnstaple. **BARRS**—1, H. Yardley. 2 and *hc*, J. L. Smith. **JACOBS**—1, W. Westcott, jun. 2, H. Yardley. *hc*, Master C. W. S. Bulpin. **OWLS**—1, J. L. Smith, Newport, Barnstaple. 2, W. Westcott, jun. **FANTAILS**—1, Master C. Bulpin. 2, J. S. Sleath, Barnstaple. *hc*, Miss F. J. Bulpin; H. Yardley. **TRUMPETERS**—1, Mrs. M. J. Bulpin. 2, W. H. Green. *hc*, H. Yardley; G. H. Gregory, Taunton. **TURNING**—1, J. G. Price, Taunton. c, G. Bulpin. **NUNS**—1, G. Bulpin. 2, M. M. J. Bulpin. c, H. Yardley. **ANY OTHER VARIETY**—1, H. Yardley. 2, G. H. Gregory.

BRITISH AND FOREIGN GAME AND OTHER BIRDS—1, No. 231. 2, A. Nicholls, Newport, Barnstaple.

JUNGES.—Dr. Scott and the Rev. G. F. Hodson.

BELFAST POULTRY SHOW.

The North-east of Ireland Agricultural Association held its annual meeting at Belfast on June 23rd and 24th. The number of entries in nearly every department was greater than at any previous Show.

Most of the poultry classes were well represented, and nearly all contained more or less good birds. The challenge cup, value ten guineas, was won by Mr. Mulligan, of Springfield, near Belfast. This gentleman showed some very good birds, and he took all the first prizes for Ducks and ducklings with birds which were very perfect both in plumage and bill. The *Dorking* class contained twelve pens, mostly Silver-Greys, and some of them very good and large. The prize pens in the *Spanish* class were good, but the rest of the class inferior. The *Cochins* were the best class in the Show, and besides the three prize pens, four pens were highly commended, and one commended. The *Brahmas* were not a large class, but the prize pens were above the average. The *Hamburgh* classes were not up to the mark, but we suppose they are a breed not much kept in Ireland. Some of the *Game* were very good; the best hen in the class was in the second-prize pen, but she was matched with one of very middling quality. We would suggest in future shows, that in the Game classes only one hen should be required. The *Geese* and *Ducks* were good.

DORING (Any colour)—1 and 3, G. Martin, Castlereagh (Silver Grey). 2, W. Charley, Dunmurry. *hc*, W. G. Mulligan. *Chickens*—1, G. Martin (Silver Grey). 2, F. H. Green, Belfast. **SPANISH**—1 and 3, W. G. Mulligan. 2, F. H. Green. *Chickens*—1 and 2, W. G. Mulligan. 3, G. Martin. *hc*, G. Martin. **COCHIN-CHINA**—1, F. H. Green (Lemon-coloured). 2 and 3, W. G. Mulligan (Buff). *hc*, F. H. Green (Iris-bred); S. T. Scott, Belfast; R. Long, Belfast (White); G. A. Perrin, Chantilly, Loughlinstown, Co. Dubbin. c, R. Long. **BRAMA POUTRA**—1, F. H. Green (Dark). 2 and 3, W. G. Mulligan (Dark). **SCOTT'S GREYS**—1, R. Long. 2 and 3, W. G. Mulligan. *hc*, G. Martin. **HAMBURGH**—*Silver-spangled*—1, F. H. Green. 2 and 3, W. J. Davison. *any other Variety*—1 and 2, C. E. M'Clintock, Glendaragh, Craugha. 3, W. J. Davison. *Golden-spangled*—1, W. J. Davison. 2 and 3, F. H. Green. *Golden-spangled*,

1, F. H. Green. 2, G. Martin. 3, W. J. Davison. c, E. M'Clintock. **GAME** (Any colour)—1, C. E. M'Clintock (Black-breasted Red). 2 and 3, G. A. Perrin (Duck-wings and Brown Red). *hc*, C. E. M'Clintock (Black-breasted Red); R. Long; G. A. Perrin (Black Red). **BANTAMS** (Any breed)—1, G. A. Perrin. 2, W. G. Mulligan (Black Red). c, F. H. Green; R. Long. **POLANDS**—*Silver-crowned Spangled*—1 and 2, F. H. Green. 3, G. A. Perrin. *any other Variety*—1, F. H. Green. *Chickens*—1, W. G. Mulligan. 2, G. Martin. **TURKEYS**—1, Marquis of Downshire, Hillsborough Castle (Cambridge). **GEESSE**—1, G. A. Perrin. 2, W. G. Mulligan (Toulouse). *hc*, G. A. Perrin. c, W. G. Mulligan (Toulouse). **DUCKS**—*Aylesbury*—1 and 2, W. G. Mulligan. 3, R. N. Batt, Belfast. *Ducklings*—1 and 2, W. G. Mulligan. 3, W. Charley, Dunmurry. *Rouen*—1 and 3, W. G. Mulligan. 2, R. Long. *hc*, G. Martin. c, G. Martin. *Ducklings*—1, W. G. Mulligan. 2, G. Martin. **PUZZLE CHALLENGE CUP**—For the winner of the greatest number of points in the Poultry Classes. Points to be counted as follows:—viz. For each First Prize, four points; Second, two points; Third, one point.—W. G. Mulligan.

JUDGES.—Mr. A. Paterson, Chapel Street, Airdrie, Scotland; and Mr. A. Glass, Ayr, Scotland; and Mr. J. Dixon, North Park, Clayton Bradford.

INTRODUCING LIGURIAN QUEENS.

A FEW days previous to the receipt of two imported Ligurian queens, kindly obtained for me from Switzerland by Mr. Woodbury, I made two artificial swarms from old stocks of black bees.

I received the queens on the 2nd of June, and at once introduced them to their future subjects, taking the precaution, however, in accordance with Mr. Woodbury's suggestion, of imprisoning them, each in a little wire cage (a pipe cover), before placing them between the brood combs. At the expiration of twenty-four hours I released the queens, and setting them free allowed them to run away and conceal themselves from view in a cluster of bees, each in her respective live. Presuming that they were well received, and that they commenced laying eggs at once, it was to be expected that worker bees, the produce of the imported queens, would be hatched on or about June 23rd, and accordingly I have been upon the watch for them ever since that date. Yesterday (27th of June), I had the great satisfaction of observing young bees beautifully marked, and in considerable numbers, clustering upon the combs and contiguous to the glass back or door of the hives, thereby assuring me of the perfect success of this highly interesting experiment.

To-day (28th of June) in the bright sunshine, as I write, these young bees are playing about at the entrance of the hives. Both of these stocks are so very strong that it is not improbable that they may send forth a natural swarm; and although the proverb speaks disparagingly of a July swarm, yet my experience is that such a swarm, with a little careful nursing and feeding in the autumn and early spring, will form in the following year as thriving and populous a stock as does a swarm that has issued in May.

I may add that up to the present time the honey season in this locality (Honiton) has been exceptionally favourable. I have a glass super, the capacity of which is about 2 cubic feet, and which is now completely filled with honeycomb. I estimate its weight at not less than 100 lbs. The stock of bees, of which this super is the produce, consists of an artificial swarm taken last year from a stock into which a Ligurian queen imported from Como was introduced in the previous year.—RECTOR.

BEES LEAVING THEIR HIVE.

HAVING purchased a beautiful Italian queen last autumn, guaranteed not more than a month old before importation, I successfully united her to a well-provisioned black stock of bees, and saw young Italians in December. They continued to increase until February, when they gradually decreased until the beginning of this month (June), when the few remaining bees, with the queen, left the hive and alighted close by. I immediately captured her majesty and restored her to the deserted hive, and the bees returned quietly, but the next day left again, flew away, and were entirely lost. They left two combs with brood in every stage of progress, also honey and pollen, but no drone brood, neither did they ever breed any drones. I hived a black swarm of bees the next day in the deserted hive and combs, and they are doing well. What was the cause? The Italians did not do the same. Are the Italians better bees for breeding and gathering honey in this country than the common black bees?—A. A.

[This appears a very inexplicable occurrence. From whom did you obtain the queen, and how was the vendor enabled to guarantee her exact age when imported?]

EARLY SUPERS.—With reference to recent letters on this subject in the Journal, it may interest some of your readers if I

give the result of my own experience. On the 7th May last, I placed a super box on a Stewarton hive. It had in it a small piece of last year's comb, and perhaps a pound of honey. I removed this super on the 25th May, exactly three weeks afterwards, and it contained 18½ lbs. of honey, nett weight.—RICHARD MILLS, *Swanley, Kent.*

BAR FRAMES VERSUS EARLY SUPERS.

REFERRING to the account of an early super in Nos. 481 and 482, JOURNAL OF HORTICULTURE, it might be interesting to some of your readers to learn that I have this year used no supers of any kind, and nearly all my hives are Pettitt's bar-frame hives, with the ten and the thirteen frames. On the 15th June I took from one of the ten-frame hives (which was a stock transferred from a straw hive this spring), six of the frames well filled with honey and well sealed over, the six combs weighing 39½ lbs. In exchange for the six full frames I put in six empty ones, which I find on examination to-day are nearly all full, and will in a few days, I think, realise a similar weight; but I shall not take more than five combs in this instance, leaving the bees five for their use during winter. I have generally considered five or six of these bar-frames sufficient for their consumption in winter, and they contain about double the comb-building space that is found in some of the common straw hives.

On the 15th of June I went to the hive above referred to with the intention of forming from it an artificial colony, but found the combs so full of honey that there was no room left for brood, and in all this ten-frame hive there was none found, excepting on one comb about 3 inches square, which was occupied by brood on either side, or about 18 square inches. I therefore thought it best to appropriate the six combs to my own use, and try on the other six rather than to make a swarm with so little brood in it.—SUDBURY.

VEGETABLES BETTER THAN NOTHING.

[W SHOULD THINK so!—EDS.]

UNDOUBTEDLY great sustenance can be derived from vegetables. Vegetarians can give us many examples to prove that not only will vegetable matter alone sustain life, but that meat is injurious. Without going so far, I limit myself to one or two instances, proving that we are not absolutely dependent on meat, and that in its absence, or a very small quantity of it, good health and strength can be secured. Volney, a well-known though not a recent authority, describes the Wallachians in his travels as "tall, well-built, robust, and of a very wholesome complexion, diseases being rare among them." Further on we are told, "the manners of the Wallachians, as far as I have been able to judge them, are simple, and neither embellished nor sullied by art. Temperate in their repasts, they prefer vegetables to fruit, and fruits to the most delicate meat." The miners in Belgium furnish another good example. They eat, according to a report made in the locality, 2 lbs. of bread per day, about 2 ozs. of butter, 1 oz. of coffee and chicory mixed, while for dinner they have in the evening a portion of vegetables mixed with potatoes, weighing at the most 1½ lb. They have meat on Sundays and festivals, but during the week they drink neither beer nor other fermented liquors. Coffee is their only beverage. Yet these workmen are hardy and healthy. It is not the coffee which sustains them, for it constitutes but 1-35th of the nutritious property of their aliment, though M. de Gasparin, in a paper read some years ago before the French Academy of Sciences, attempted to prove, from certain tables, that the waste in liquid excretion is less when coffee is drunk than at other times. The miners' coffee is not like the French *café au lait*, for it has but 1-10th part of milk in it; he drinks several pints in a day, and eats only bread and butter until the vegetable meal of the evening. The albuminous substance which enters into the rations of the Belgian miner is thus reduced from 23 grammes to 15 grammes of azote. This is less nutritious even than the diet of the monks of La Trappe at Aiguebelle. Here is, therefore, proof that life and health can exist throughout a whole population with less nutritive substance than is generally considered necessary; that meat can well be replaced by vegetable and farinaceous matter. But it will be argued, that the impoverished British workman and pauper will object to the diet of the Belgian miner. In answer, however, might it not be suggested that the Belgian acts with greater wisdom when he preserves his health and spirits even on such a miserable diet,

than the Englishman who, constantly aiming at nothing less than the sirloin, falls short of the goal, and consoles himself with spirituous liquors? There is fortunately a medium course, and much despair might be avoided if our poor, and indeed some of the lower middle classes, knew better how to combine vegetable substances, and produce excellent meals, without any assistance at all from the butcher. Occasionally a good wholesome vegetable diet would be better than nothing; and, by refreshing the blood and assuaging thirst, would lessen the temptation of drink, always so great in moments of feverish anxiety, poverty, and want. Without adopting the miner's diet, many a good meal can be made for a few pence from vegetables, cooked with more heart than at present shown. It would take too long to analyse all the different vegetables at hand; but I will, on a future occasion, return to the subject, and for the present content myself with a few practical examples illustrative of my meaning.

For a cheap, yet tasty and substantial dish, let me suggest that the housewife grate two carrots, two turnips, one parsnip, a little beetroot and artichoke into one pint of split peas, boiled in two quarts of soft water for two hours. The whole might then be boiled with three teaspoonfuls of Indian, wheat, or Scotch meal, mixed in cold water, leaving it to simmer together for two hours more; a little parsley, mint, and thyme will flavour the dish. More water might be added if necessary. This somewhat complicated "hodge-podge" would well satisfy a middle-class family, and cost less, at any rate, than a joint. It would not do, perhaps every day, but might occasionally save the meat and avoid the horror at stinting at dinner. For a cheaper dish, why should not the lentil be introduced for everyday use in England as in France? For instance let a pint of lentils be soaked in pure soft water for twenty-four hours, then put in a stewpan (earthen or enamelled is best), and boil for four hours. Then two onions, one parsnip, one carrot, a little parsley, thyme cut small, and a small quantity of boiled rice should be added. This, mixed and boiled a short time together, would produce a satisfying and savoury dish, somewhat better than the diet of the Belgian miner, and yet very cheap. Lentils are about the most nutritious vegetable we possess. In 100 lbs. they contain 84 lbs. of solid matter, and 16 lbs. of water, of which 33 lbs. are flesh-forming, and 48 of heat-forming principle; while butchers' meat, according to Baron Liebig's table, has but 21.5 lbs. per cent. of flesh-forming principle, and 14.3 that gives heat. The rice has 82 per cent. of the heat-forming principle. Compared with these, the other vegetables are more useful as giving water, flavour, and rendering the dish light and digestible. The celebrated Indian and Chinese dish called *dahl*, has also lentils for its chief ingredient, and is purely of vegetable matter. It is substantial and delicious, and is made as follows:—Stew a quart of split lentils till they form a thick soup; have ready a pound of rice, well boiled in milk, and drained off as dry as possible. Shake the rice up loosely in a dish, and, after mixing an ounce of curry powder with the lentils, pour the lentil soup over the rice and serve it up. Dishes, cheaper even than these, may be made palatable.

Before concluding, however, there is one important objection which has often been made, through ignorance of the first rule in cooking vegetables. It is observed that a meal from them is not satisfying. I have found it frequently happen that the person who thus objected, did not know even how to boil a vegetable. The rule is simple, but must never be forgotten. Every kind of vegetable intended to be served whole should, when put to boil, be placed at once in boiling water; and this applies especially to potatoes, and vegetables from which the outer cover has been removed. Now it often happens that potatoes, &c., are, to save time placed in cold water and left to boil gradually. It is just this which allows the nutritious matter to escape, and renders the meal unsatisfying. When, on the contrary, the water boils from the moment the vegetable is immersed in it, the albumen is partially coagulated near the surface, and serves to retain the virtue of the vegetable. The reverse is, of course, the rule for making soup, or any dish from which the water will not be drained. By placing the vegetables in cold water the albumen is slowly dissolved, and actually mixes with the water—a process most necessary for the production of nutritious soup. It is to be hoped that the poor, who have a special need for the most their money can produce, will learn, in whatever haste they may be, not to boil all the albumen from their potatoes, reserving for their meal only the starchy matter.—(*Food Journal.*)

OUR LETTER BOX.

SEPARATING CHICKENS (C.B.).—The time at which you require to breed stock birds must influence you in separating your chickens. There is, however, no fear if they are but two months old. As a rule with birds of

that age, October will be soon enough. The curd was fully described in one of our early numbers of "Rational Poultry-keeping" (see page 365 of last volume). If you do not mean to breed again from the parent cock, the sooner he is removed the better.

INFLAMED EGG-ORGANS (*Psewich*).—We cannot better answer your question than by giving the following quotation from the "Poultry-keepers' Manual":—"Symptoms, the hen goes on to the nest without laying; having a straddling gait; laying shell-less eggs; dropping eggs from perch or elsewhere. Cause, overfeeding. Another cause is eating the seeds of grapes, or grain affected with ergot. We once knew a yard of Dorkings having an extensive grass run. They all laid shell-less eggs, and the pellets evidently had over-excited egg-organs, the eggs were distorted, and added eggs, almost without exception, characterised every sitting. We believe the seeds of the grasses were affected with ergot. It may be necessary to explain to some of our readers that ergot is a fungoid substance, which completely changes the composition of the grass seed which it attacks."

EGGS OF PIGEONS FOR SALE (*Gls-pe*).—We have only known Pigeons' eggs to be bought by boys at the bird shops, the dealers not wishing the Pigeons to breed in the cages. We should scarcely think valuable eggs are to be bought, as the bird laying but two, there are none to spare.

EXHIBITING DISEASED PIGEONS (*Constant Reader*).—We think that diseased birds, of whatsoever sort they be, ought not to be exhibited for many reasons, such as fear of contagion, unsightliness, &c. The Carrier alluded to must have been by far the best bird, so the judge acted rightly. It was for the committee to have interfered, as they make the rules.

CARRIERS AT SPALDING.—Mr. Massey says we printed his notes erroneously, and that the line commencing "I rather gave the preference, &c.," refers to Mr. Ord's bird, and not, as it now reads in the printing, to Mr. Filton's.

COCK CARRIER PIGEONS AT SPALDING (*An Exhibitor*).—Perhaps it was a mere mistake of the printer of the prize catalogue, and it ought to have been printed thus—"three years," instead of "three months."

FOOD FOR YOUNG SKYLARKS FEEDING THEMSELVES (*A Subscriber*).—German paste, stale bread crumbs, and the yolk of hard-boiled egg, mixed together; fresh water should be given separately, and as they grow larger, supply occasionally two or three mealworms and a few ants' eggs. Barley meal should not be given.

YOUNG NIGHTINGALES (*Idem*).—The yolk of hard-boiled egg, raw beef chopped fine, stale bread crumbs grated fine—the same as put on fried soles—mixed together, and about two mealworms a day; occasionally a few ants' eggs. As they grow older they will require more mealworms. There are very few British and foreign birds that will agree together in an aviary.

CANARIES NOT SINGING (*T. S. J.*).—The fact of the Canaries being placed so that they can see each other ought not to interfere with their singing. On the contrary, if they are in health and "fresh," they should sing one in opposition to the other, rather than maintain a prolonged silence. You can solve the question for yourself by altering the position of the cages; or if that be inconvenient, nothing can be more simple than to cover one side of either cage so that the respective tenants cannot take stock of each other. In their privacy they might be indeed to compare notes—that is very nearly a pun! Discontinue the bread and milk, and boiled carrot and egg—in fact, all messes. More birds are injured by over than by under-feeding. Give only canary and rape, with such green food as may be in season.—W. A. BLAKSTON.

COCK GOLDFINCHES TAPPING THE EGGS (*C. S. De Witt*).—The nest suggested by our transatlantic correspondent is a modification of one long in use among Mule-breeders here. I refer to what is known as a "drop-nest." It is simply an ordinary circular tin nest box, in the bottom of which there is a hole, and to the bottom is attached a tin box containing cotton wool, swan's down, or any soft material, into which the egg falls. This box or canister is easily detached from the nest, and the egg can then be removed. I would not advise the substitution of a cloth receptacle, for both birds will be unceasing in their attacks on it, one in quest of a shred or two for her nest, and the other from sheer mischief. The first contrivance of the kind I attempted was a combination of a tin nest and the leg of one of "Jacky's" stockings, which I purloined for the purpose. I thought my apparatus was perfection: unique it certainly was. Next day I found my little stocking hanging in threads surrounded by a very neat nest manufactured from the ruins, but no egg. My impression was then and is now, that the Goldfinch knew something about the disappearance of that egg. He was in fine voice that morning (of course, owing to the raw egg), and as he sat on the edge of the nest, woven with infinitely more skill than the poor little stocking, he gave such sly looks and such whisks with his tail, that one was driven to the conclusion that he was crowing over the demolition of the bag and the abstraction of its contents. No one ought to attempt Mule-breeding without having his head phrenologically examined, and if patience and hope be not largely developed, do not begin. Too much care cannot be taken of a Mule-egg. Who knows what it may produce? I never yet knew one to be broken but a prize bird was considered as lost. The hatching of each succeeding nest gives rise to the wildest surmises as to the value of its contents. Daily and hourly the faintest dark speck is looked for, and I have even surprised an enthusiast in his sanctum making microscopic investigations. But nothing can exceed the happiness of that man who, after a fortnight or three weeks of most anxious suspense, can quietly compose himself in his arm-chair, coolly comb his beard, sip his coffee, and announce to eager inquirers "One even-marked and two clear in one nest!" And who shall tell the disappointment of the man who has—this season—bred fifty dark ones?—W. A. BLAKSTON.

COMMENCING BEE-KEEPING (*Marian*).—Purchase from any neighbouring bee-keeper one or more first swarms which issued in May. It will, however, be best to defer their removal until autumn; but if you are too impatient to wait, they should be tied up in cloths of open texture (cheesecloth), and removed very carefully in the cool of the evening. If you can agree with the vendor to do this at his own risk, so much the better, as the combs, being at this time new and heavy, are liable to fall if the hives are roughly handled.

SPERRING AT THE TIME OF HIVING (*A Regular Subscriber*).—Much depends upon the size of the super. If it be but a small one, you have only followed the example of many apiarians, who advise its being put on when the swarm is first hived. We, however, think it best in any case

to defer it for a few days after hiving, so as to insure the new colony first commencing operations in the stock hive. The super should be removed when full, or at any rate as soon as the honey harvest is over, as it would do more harm than good to allow it to remain on during the winter. If, when a super is removed, the bees which it contains soon fall into confusion, and begin to return to the stock hive, all is probably right; but if, on the other hand, they remain quiet, whilst a commotion arises in the hive itself, the queen may have presumed to be in the super, which in this case should be returned, and the operation deferred until some more favourable opportunity.

ARTIFICIAL SWARM (*T. Jacobs*).—What we advised was to form an artificial swarm by driving all the bees of one stock into an empty hive, and then to repeople the deserted hive by putting it in the place of another stock. What you appear to have done is to drive out a part, or, perhaps, nearly the whole of the bees, without taking any steps towards rearing the exhausted population. Under these circumstances it is difficult to predict the ultimate result. From what you state, it seems most likely that the queen accompanied the expelled bees, and therefore if the remainder of the season be favourable, there seems no reason why the swarm should not do well. With regard to the old stock, the matter is far more uncertain. If sufficient bees remain to hatch out the brood, a queen will, probably, be reared, and all may be right. If, on the other hand, the remaining population is too scanty, most of the brood will become chilled, and the colony will be ruined. Should the stock survive until the autumn, it will, doubtless, be benefited by adding to it the bees of a condemned colony.

DRONE SLAUGHTER (*Dawlish*).—A general massacre of drones shows that the honey harvest is now at a standstill, but it does not prove that the cessation is more than temporary.

SUCCESSFUL SWARM (*R. B. N.*).—A swarm hived on the 2nd of June, and having gathered 24 lbs. of honey and wax by the 23rd, has done well.

METEOROLOGICAL OBSERVATIONS

COVENT GARDEN MARKET.—JULY 6.

MARKETS are generally well attended, and a fair amount of business doing, the supply of soft fruit having much improved during the past week. Hothouse produce is ample, Pineas and Grapes being largely supplied at lower prices. Continental goods comprise Peaches, Nectarines, Apricots, Melons, Cherries, and Figs.

From observations taken near London during the last forty-three years, the average day temperature of the week is 74.6°, and its night temperature 50.4°. The greatest heat was 94°, on the 17th, 1894; and the lowest cold 33°, on the 17th, 1863. The greatest fall of rain was 1.60 inch.

PRUNING ORNAMENTAL TREES AND SHRUBS.

No. 4.

HAVING in previous papers treated at considerable length on pruning Conifers and the forms most suitable, I have chosen for my third section the most serviceable of all evergreen shrubs.

Section III. consists of Hollies, Laurels, Sweet Bay, Laurustinus, and Box. As specimens on lawns or at the sides of walks I know of no equals to them. They can be pruned to any extent, and in a short time

will be as green and well covered with foliage as ever; and they can be formed into cones, pyramids, round bushes, or any other shape, and be kept to it with the smallest possible increase in size; hence their adaptability for architectural gardens. The subjects comprised in this section are well worthy of separate note; therefore I shall commence with the Holly, which admits of three different modes of pruning, or rather training, to secure—1st, cones or pyramids; 2nd, bushes; 3rd, open natural trees.

Hollies as Cones or Pyramids.—Man can aid in producing more beautiful objects than Nature left to herself, but he cannot cause a subject Nature has decreed shall be a pyramid to become a handsome bush. Mr. Rivers, the father of close pruning or summer pinching, has found out that: some kinds of fruit trees, he tells us, are not adapted for bushes, but they form handsome pyramids, and the contrary also holds true; and so it is with Hollies. All may be formed into cones, but it is by a very close cropping of the side shoots, and the subjects thus treated never have a natural appearance; they are on a par with standard Roses—the acme of ugliness.

Good sorts of Hollies for cones are I. Aquifolium, Aquifolium femina, Aquifolium flava, altaclerensis, balearica, glabra, Hodginsi, maderensis, and Shepherdi. All except the first three have splendid broad leaves; the best are Hodginsi, maderensis, and altaclerensis; the first of these will form a fine avenue when planted by the sides of a broad walk.

Of the variegated sorts, the gold and silver-edged are the best two; then Handsworth New Silver, Gold and Silver-blotched, and the Gold and Silver Queen's, but none outvie the two first-named and oldest.

Cones or pyramids of any of the above are secured by, as might be expected, cutting in the sides and encouraging the top. The trees almost invariably grow more strongly at some distance from the ground than near it: hence the necessity of securing branches near the ground or base of the tree while it is young, for if not produced then they cannot be obtained after the tree is of good size. The greatest difficulty is in securing a good leader and keeping it perpendicular. If the trees are required to form close pyramids, a strong growth in the leader is a disadvantage rather than a gain, as with a vigorous leader we have the side shoots considerably further apart than when the growth is not very strong. I consider it well to select for pyramids trees with straight stems, and with the branches

set on near the ground, and the pruning of the side shoots should begin when these have extended about 1 foot from the stem. Then take off their points, and a string fastened to the end of the shoot, and extending upwards to a height of 3 feet, and brought to the centre of the tree, will show to what extent the side shoots are to be pruned, none being pruned closer to the main stem than 3 inches; the leader being 6 inches above where the side branches are cut back to 3 inches. This being done, we shall have trees about 4 feet high, half that through at the base, and gradually tapering upwards. Care should be taken to have the centre erect, the cone from the base tapering upwards all round. The best time to prune is just before the trees begin to grow, and they will not require any further pruning the same season than the stopping of any irregularity of growth, which it is better to do in time; for by stopping a strong shoot during its period of growth we induce greater vigour in those shoots remaining un-stopped, and have a greater chance of obtaining in the stopped shoot growth of the character required.

The following spring the tree will need to be gone over, and the side shoots cut in, or such of them as have extended beyond an extent corresponding to the others; and as we may in a vigorous, healthy tree calculate on about 4 inches of annual increase in the growth, we must shorten the lowest shoots to that length, and with a line from them, as before, to the apex or top of the leader or tree, it will be readily seen to what extent the side branches will require shortening. We have in this case a greater increase of the tree at its base than in its upper parts. The top will always be the strongest, therefore cut in the top most, and the lower part will become well furnished: this effected, we can easily furnish the top. If the leader deviate from the perpendicular, either cut it away to the point where it is in the centre—and this is the best plan if the leader is very strong—or secure it in the centre with a stake, the latter mode being desirable when the tree is growing weak in the centre. The whole art in pruning Hollies in the form of cones is to cut them to that form every spring, and leave the rest to nature. The trees will sometimes put out strong shoots from the main stem or branches, and those having an upward tendency, or growing over shoots they must enfeeble, should be rubbed or cut off close to the part whence they proceed. The trees will not have an equal amount of branches all round—some parts will be thick, others thin; therefore, in pruning, thin out the most crowded parts of the tree, and cut the thin parts but little or not at all, only pruning enough to preserve the required shape. Open spaces or sunk parts should not have the shoots shortened, but be allowed to grow until the space is filled up.

Bushes are formed by restraining the upper part or centre of the tree, the shoots there not being permitted to grow erect, except for the extension of the plant. To secure a close growth near the base it is necessary that the head be taken off at the height of 2 or 3 feet from the ground, and the side shoots ought not to be stopped until they are distant from the stem half the height of the tree. This will afford the basis of a half sphere. All that is required

beyond this is to cut off the irregular-growing shoots in spring, commencing with those near the base; in fact, this ought to be done whenever there is a deficiency of vigour in the weak shoots, which, for the most part, are at the base of the tree. The pruning of those parts should be done about a fortnight or three weeks in advance of the pruning of the shoots in the upper part of the tree. This will cause the lower shoots to form buds, or, it may be, start them ere the shoots at the upper part are pruned, so that when the upper shoots are shortened the lower shoots will start freely, making more vigorous growths than if they were pruned at the same time as those at the upper part. Pruning is not necessary every year, so long as the form required and close growth are secured, and yet it is well to go over the bushes periodically and do whatever is necessary; for nothing is so ugly as an irregular-growing bush Holly. Beyond restraining the growth upwards, the pruning of bushes is not materially different from that of pyramidal trees.

Open natural-shaped Trees.—These are best with one leader, though it is not uncommon to see them with two or more, and in a state of nature they usually have several. Now, if the tree is young, there is no excuse for more than one leader, and being kept to that, the side shoots will only need to be shortened where too long in proportion to those in another part, thinning them out where too crowded, in order to encourage growth in the weak and open parts of the tree. Care should also be taken to cut out all shoots or branches that cross each other, or which, from growing upright, are likely to interfere with the leader or with the vigour of the side branches.

In case of two or more leaders having been formed it will be necessary to see to their vigour being equalled, which may be secured to a great extent by cutting in the strongest in spring after growth has commenced, and not pruning the weakest that season. It will also be necessary to prune the side branches so as to give an equal extension to them, and to preserve the balance between all the parts of the tree.

Those having Hollies that are too spreading and too loose, taking up more space than is desired, and badly formed, will do well to have them pruned into shape. The end of March or beginning of April in a mild season, or a fortnight to three weeks later if the season is late and cold, is the most suitable time. Hollies will bear pruning to any extent, but of course break most freely from the smaller branches. The strongest shoots or branches should be cut back more, and the smallest least, for if they are all cut off to one length the strongest will push much more vigorously than the weak, and soon be more extended; hence they should be cut well back, or say a foot more than a branch half their thickness. The small shoots should be cut back evenly, so that there may be as nearly as possible an equality in the growth the first season. The very weak branches, and those which cross each other or grow upright, should be cut well in, and, if need be, cut clean out. To secure good growth, well thin out the branches; they do no good crossing and overlying each other. If the weather prove dry in May and the beginning of June give a good watering, and the growth before autumn will be good, and the following year handsome trees will be the result. I have cut Hollies that had a very large spread of head so closely in that there was little but sticks left, and have surprised those asking for their removal as wondrously objects with the handsome pyramids or bushes secured by a judicious use of the saw and knife. I have seen old spreading open trees formed into pyramids and bushes so close that birds had to seek an entrance from beneath.
—G. ABBEY.

NOTES ON ROSES. AND THEIR CULTURE.

MR. RUDOLFF has spoken in such glowing terms of Felix Genero that I think it right, in order that amateurs who have not seen the Rose may not be disappointed in ordering a great number, to say that I do not think the opinion of Rose-growers in general would bear out Mr. Rudolff's estimate of it. It is, no doubt, a good grower, but the colour is dull (red, with too much of a violet tinge in it), and the shape by no means first-class. The outer petals are never large enough. It is more of the form of Prince Henri de Pays Bas, which, though I know it is admired by some Rose-growers, does not approximate a high standard in shape. The only thing, in my mind, to recommend in the shape of Felix Genero is, that having incurved petals it hides its own deficiencies, as I have never yet picked a flower of it that was very full in the centre, if the incurved petals were pushed back to examine it. It would be interesting, I think

if Rose-growers were to classify their Roses under their different forms, taking well-known Roses as standards of form—as, for instance, Alfred Colomb, Comtesse de Chabillant, Baronne de Rothschild, Louise Margottin, La Ville de St. Denis, &c. I hope some of our best observers of Roses, as the Rev. S. R. Hole and the Rev. E. N. Pochin, will do so, and if new Roses, when they came out, were described in this way, as to their shape, it would very much help persons who wished to order some of the new sorts.

While on the subject of Roses, I add, hardly any Rose has done so well or improved so much with me this year as Princess Mary of Cambridge. Fisher Holmes has also gained much in my estimation, and Madame la Baronne de Rothschild is almost perfection as a pink. La France has also been very fine, though too loose in the petal; and Annie Wood has had some exceptionally fine flowers. I never remember to have seen dark Roses burn so much as this year. I can hardly get a Rose from Monsieur Boncenne, Lord Macaulay, Duke of Wellington, or Pierre Notting which is not burnt, and I am thinking another year of planting all very dark Roses by themselves in a quarter in my kitchen garden, and fixing up some framework of laths, so as to be able to cover it over entirely with tiffany on very sunny days. Those that have no shade of purple in them, as Alfred Colomb, Marie Baumann, Le Rhone, La Brillante, &c., can stand the sun, and so do all the cerise, pink, and pure white Roses; and it is one great point to recommend pink Roses, that they seem to last much longer than dark Roses, either crimson or scarlet. For instance, Princess Mary of Cambridge, Abel Grand, and Baronne de Rothschild keep their true colours and last longer than almost any Roses I am acquainted with. There are other Roses which ought to be grown in the shade as well as the dark ones; for instance, Souvenir de Malmaison and Gloire de Dijon are both of them improved both in form and colour in hot summer weather if they are well shaded. Souvenir de Malmaison, especially, should never be exposed to full sun. Miss Ingram, again, and Acidalie, also seem better for a slight shading.—C. P. PEARCE.

TABLE DECORATIONS.

IF I refer to this subject again, it is not because I have seen any reason to alter my opinions, or that I can throw any fresh light on it, but because I have had the opportunity of seeing since I wrote last two examples of decoration, one showing how it ought to be done, and the other just the opposite. I allude to the arrangement made at the Rose Show at the Crystal Palace by W. Thomson, Esq., of Penge, and the other at the Royal Horticultural Society's Rose Show. The former was almost perfect in its way; the latter, with the exception of that which obtained the first prize, as bad taste as it was possible to be.

The exhibition which had been made by Mr. Thomson was in the large theatre, which had been altered for the purpose, and consisted of one large dining table and two smaller ones, the two smaller ones being arranged by professional artists, the centre one by amateurs. It is to this centre arrangement that I desire to draw attention, and although it is quite impossible to describe it, yet I shall endeavour to give a brief sketch of it. The table was large—probably would dine twenty people—and was a long oval. As the cloth is never removed now-a-days, the old tale of sitting under one's mahogany may be considered as exploded, and any kind of wood may be used. In this instance the top was of deal, and in it holes had been made to receive flower pots containing Palms; instead of the ordinary tablecloths strips of Jamack are placed on, by this means the pots are concealed, and the Palms look as if they spring from the tablecloth itself; after they have been placed the cloths are ironed, and all looks perfectly smooth. Some seven Palms, I think, were placed on the table, the centre one being the tallest, and the others arranged according to height, the general height being about 3 feet. On either side of the tall Palm were very tall and graceful-looking glass vases, containing a few Fern fronds and some sprigs of the climbing Fern. On the outside of the Palms were six glass vases filled with Fern fronds and Pelargoniums. In some of them were flowers of Hibiscus, and this was almost the only piece of coloured flower in the entire arrangement. To give colour, coloured wine glasses, two to each plate, were used, and coloured finger glasses. This seemed to me to fulfil all the conditions of good taste, and to fall in with the canons I have laid down; for the arrangement was simple, there was no obstruction of the view, there were

no highly scented flowers used, and there was but little colour, what there was being quite adapted for its purpose. No faults of deep blues and glaring yellows were to be found there, all being in quiet and unstained harmony, yet I heard numbers of people complaining of too much green, want of colour, &c. There was but one fault to my mind, and as it was candidly acknowledged by the exhibitor I feel less compunction in noticing it. There was a want of something round the base of the Palm stems, as they looked too formal and unnatural coming out directly from the tablecloth. I see some one has suggested allowing the rims of the pots to appear, but this would seriously interfere with the tablecloth. It strikes me that semi-circular troughs of white ware, such as were used at the Palace, to encircle the base, and then to be fitted with Lycopodium, would be a desirable method of getting rid of this objection.

And now to the obverse of the medal. Prizes, liberal prizes, were offered by the President of the Royal Horticultural Society for table decorations, and yet there were only three competitors. The first deserved its prize; for although there was nothing original in it, it being, in fact, the arrangement that took second prize amongst amateurs at the Palace, yet there were no violations of taste. But why the Judges should ever have given anything to the second and third prize arrangements passes my comprehension. I can only explain it in one way—they were lady judges, and they lean to the side of mercy, and so would not disqualify; but it was hardly, in my mind, possible to find anything so thoroughly violating all taste. It was a vase filled with a considerable mass of the common white Lily, and the base with the white Water Lily; around it were placed some cardboard troughs containing single blooms of scarlet Pelargoniums. Imagine the faint and sickly smell of the Lilies in a heated atmosphere, and how utterly the white was lost on the white tablecloth, while the lumpiness of the arrangement would hinder, if there were more stands, any view that there might be across the table, and most certainly few people would desire to have such a stand before them for the length of a dinner. Let us hope—though giving prizes to such productions is liable to defeat it—that a more correct taste may lead people to copy better examples than the latter one.—*E. Deal.*

MORE ABOUT SOFT SOAP.

I AM glad the claims of this article as an insect destroyer are recognised in your number for June 30th by your able correspondents—"ANNANDALE," page 460, and "R. F.," page 467; and I hope others who have tried it will report the result, whether satisfactory or not. As my former communication has evidently been misunderstood by "ANNANDALE," and, on the other hand, I have since found I was led into an error about the price, to which "R. F." very properly calls my attention. I will endeavour to explain both. In the first place I may say that the strength of the wash made from this material, as used by the Hop-growers, is not so great as "ANNANDALE" himself advises—viz., 2 ozs. to the gallon, as 1 lb. to ten gallons (the Hop-grower's recipe) is little more than 1½ oz. to the gallon. Whether this be too strong for Peaches or not I cannot with sufficient authority affirm, as in the cases where we used it sufficient attention to weights and measures was not paid to be depended on; but if a less quantity of soft soap be required, so much the better, as it cheapens the solution, unless in seasons like the present, when twenty or thirty gallons of water may in some places be more costly than the pound of soft soap.

As, however, the price of the soap is the point to which general attention will be directed, I confess to having been led into an error through the imperfect formation of a figure, or other cause, by which the 2d. per pound should have been 3d., an important advance, which, probably, by the retail dealer will be considerably augmented. I have made further inquiries respecting the soft-soap trade, and have learnt from a friend keeping a shop in a country village (who, amongst his other manifold stores of food, clothing, and tools, also deals, or rather dealt extensively last year in this article), that it is usually made up into small casks, called firkins, weighing 64 lbs. each in the gross, being supposed to contain 56 lbs. of soft soap. These firkins he sold at from 14s. to 16s. each, and at the time the demand was for them, fifty or sixty firkins a day were not an unusual sale, and this at a country shop. The consumption of soft soap in the neighbourhood during the months of June and the early part of July last year was, therefore, very extensive. Fortunately for all but the dealers in soft soap, none has been wanted this year, the plant being clean, or but little affected by insects. I may add that I believe an

article cheaper than 14s. per firkin was often made use of, but at this price it is just 3d. per pound; but even if it were twice as costly, it will favourably contrast with any other insect-killing material in use if the sixpence so expended furnish ten, twenty, or thirty gallons of solution as the discretion of the party using it may suggest. It would certainly be prudent not to make it too strong for delicate plants, but I am far from certain that it is so dangerous as is represented; on the contrary, I believe it to be more harmless to vegetation than many of the mixtures so much recommended. Of this I shall be able to write with more confidence later in the season. Meanwhile I advise caution.

I have no hope of being able to say much on the application of this insect-destroyer to the Hop plant in the present year, for the fly has not made its appearance in sufficient quantity to require the antidote. Other enemies the Hop has, which I hope to refer to in a future communication; no plant that I know growing in the open air is so liable to misfortunes.

I may here mention one other quality which soft soap is said to possess, although I do so on general repute rather than from any well-founded experiments of my own, and that is, that the solution is a manure, which certainly cannot be said of some of the mixtures used as insect-killers. Others, however, will probably give information on the subject, and a few experiments could be easily tried to test its value as a manure, as well as to try the effects of solutions of different strengths on the foliage of plants.—*J. ROBSON.*

AËRIAL ROOTS ON VINES.

I DIFFER from Mr. J. Douglas (see last volume, page 419), respecting some of the causes of air roots on Vines. A close moist atmosphere, which is generally an accompaniment of early forcing, is what I consider to be their real cause. Vines exclusively planted in an inside border are those which the most frequently produce air roots, owing to the bottom heat driving the moisture upwards and causing a great density in the atmosphere of the house. This condition will produce air roots in abundance, if ventilation is not strictly attended to.

I have seen Vines which were planted in an outside border only, and started about the 1st of January, with about 3 feet deep of horse manure mixed with leaves placed on the border, produce better Grapes than those which had the advantage of bottom heat, and yet scarcely an air root was to be seen. I have likewise noticed Vines that have had the advantage of both an inside and outside border produce air roots freely one season and the next scarcely any. Would Mr. J. Douglas say how he accounts for that?

Vines that are cropped late will produce air roots freely enough if the foregoing condition be afforded—that is, a close moist atmosphere; but this state of things seldom exists, as air can then be admitted without such discrimination as is required in early forcing.—*QRO.*

OUR NATIVE FERNS.

I HAVE before me my friend Mr. E. J. Lowe's very beautiful work bearing the above title. I begin to think that "distinct varieties" are often made out of nothing at all. Two years ago I was watching a self-hunting dog; about midnight I kindled a match under the shelter of a thick bush where I was concealed, and to my astonishment the blaze revealed a magnificent plant of the Crested Male Fern, by far the finest I ever saw. Mr. Dickenson, who has been a botanist all his life, has, I believe, only once found it in Cumberland. This year it has come "blind" and all manner of shapes. Miss M. Wright, of Keswick, gave me one found by herself, and pictured in Lowe as *Lastrea F.-mas abbreviata cristata*. This year it has come perfectly plain and run back to the normal form. I have many similar communications to the same effect, which tend to show that such Ferns are not varieties, but monstrosities which sometimes recover.—*JACKSON GILLBANKS.*

POTATOES.—In answer to a correspondent, the Pebble White Potato has a white blossom. Pebble White, Crystal Palace Kidney, Edgecote Second Early, Yorkshire Hero, Beaconsfield Kidney, Huntingdonshire Kidney—all strains of the old Cobler's Lapstone—I have growing by its side, and their blossom and foliage are almost identical to a shade. All the numerous strains of the old Lapstone can scarcely be distinguished from

each other during their early growth; and, curiously enough, in my graft hybrids a change of foliage is now distinctly seen, excepting only in those of the grafted Lapstone family. I have about two hundred varieties of Potatoes growing here.—ROBERT FENN, *Woodstock Rectory.*

GREEN FLY ON CUCUMBER AND MELON PLANTS.

I AM sorry to hear that some correspondents have fumigated with tobacco and syringed with soft-soap water without any effect. I know of no better remedies for plants under glass, and when used in time I have always found them less or more effectual. No green fly will stand tobacco smoke when presented to it strong enough, but smoke will not hurt those just hatching into life, and even very young green fly will stand a dose which older fly will not. Unlike what takes place in other departments of life, I have generally found that in insect life the vital powers are strongest in proportion to youth, or even infancy. If the plants are pretty good I should recommend a continuance of the smoking and the washing. Perhaps it may be as well to allude to a few of the essentials to success.

1, The smoke must be kept in the place for a considerable time. Hence, unless the glass roof is very close, it should be covered, and litter or short grass placed at the top and bottom of the sashes, and then the glass and covering should be kept damp by syringing outside, which will fill all laps of the glass, and prevent the smoke escaping. It is better to shade than give much air the following day. Smoking is best done in the evening. With these precautions, 2 ozs. of tobacco will do as well as, or even better than, a pound when the smoke is allowed to escape.

2, All plants smoked should be dry as respects their foliage; not only is this necessary in order that the smoke may tell at once on the insects, but also that the smoking may be safe to the plants. The narcotic that kills the insects will also poison and destroy the plants if presented to them in excess, and more especially if the foliage is damp. I have a hazy conception in my own mind as to how this is, but it is not quite clear enough to myself to enable me to put it in black and white for the benefit of others. Would chemists, whom I have helped in days of yore, say how it is that tobacco smoke affects the leaves of plants so differently when they are wet and when they are dry?

3, Tobacco smoke and all combinations of tobacco should come against the leaves cool. The different fumigators that work with a wheel, patented or otherwise, are very useful in this respect. To be used against plants I would recommend them to our amateur friends, just as I would use them myself; but they are of little use in the hands of common labourers, who soon make all such instruments worthless, and then, if we do not do the work ourselves, we see the folly of investing in an instrument of from 10s. 6d. to 15s. that will so soon be unworkable. For common purposes I use a metal pot, or a common garden pot. Our consumption of tobacco is very small. I know smaller places where more pounds are spent for tobacco than we spend shillings. I am more anxious to keep insects away than to destroy them when they come. For more than one reason, though I think good shag tobacco the best, yet I generally use a little tobacco paper, and of all I have met with as yet, that manufactured by Griffiths & Avis, and sent out at 2s. per pound, I have found the safest and most effectual. The efficacy and safety will greatly depend in every case on the coolness of the smoke. If we use a pot, we therefore cover it with damp moss, and keep it as far from the leaves as possible. Besides presenting the smoke cool, it is always safest to give two or more moderate smokings instead of one heavy one.

The more slowly the tobacco or its preparations are burned the more effectual the smoke will be. I have seen half a shovelful of red fuel used to light a pot of such smoking material. It is best in every way to use one red cinder or a piece of ignited charcoal, put just a little very dry straw, or slips of paper over it, and when burning add the tobacco, &c., and cover first lightly and then more heavily. Where moss is not to be had, a little short grass or damped litter answers equally well. If a garden pot is used, enough of air to support slow combustion will be obtained by the hole in the bottom, if the pot be elevated to leave the hole clear. My dislike to tobacco is chiefly owing to being obliged in my young days to have a hole in the sides of such pots, and then to blow away with a

bellows in a house until it was full of smoke. There is not the least necessity for such barbarism, if a little care and precaution are used. When a fumigator is used, its pipe may pass through a hole whilst the operator remains outside. In all cases where a proper fumigator is used, and the possessor of a little garden is his own operator, nothing is better or even more economical than good shag tobacco. The instrument insures that the smoke, when it reaches the plants, shall be cool.

Lastly, for the present. If you wish one or two smokings to be effectual, smoke as soon as you see the first insect. If you wait until the larger leaves are covered with them, one smoking and syringing will be of no use. In fact, if the bulk of the leaves are so infested, except as an experiment, it is next to labour and money thrown away to smoke at all. The cheapest remedy would be to clear all out and commence afresh. Leaves thus infested with insects seldom recover the combined effects of the insects and the smoking. If only a few leaves are very bad, even if they suffer, the younger ones will come all right. But whenever leaves are much infested, several smokings at intervals of twenty-four and forty-eight hours will be necessary. On every such leaf there will be found several generations of insects, and the younger will escape what will destroy the older ones. Besides the myriads coming into life at once—that is, viviparous, there are myriads of eggs that the heat is continually hatching, and on these, until fairly established in existence, the smoke has no effect. Hence, late smoking, so as to give the insects the chance to propagate freely, involves the trouble of many smokings to get rid of them, as what destroys the older will leave the younger insects and the eggs untouched.

Washing with soap water is more effectual after smoking than washing alone. Reference has lately been made to the strength. It is less effectual in frames and shallow pits than in houses or places where the plants are fastened to a trellis, so that the under sides of the leaves can be freely washed. The insects must have firm hold before they appear on the upper sides of the leaves. Washing is effectual in proportion as the under sides are freely reached. At the strength spoken of by Mr. Robson, not only would the insects be killed and dislodged, but the eggs that were not dislodged would to a great extent be sealed-up from the action of air, and if so, the insects would never chip the shell. The wash is best applied the day after smoking. If the day, after smoking the previous evening, should be dull, or the glass shaded, and little or no air given, I would defer the washing to the second morning. Where this cannot be well done, I would syringe the following morning or afternoon. I am thus precise because the correspondents who have made the inquiry are only a few of many who say tobacco smoke and soap-water washing are powerless against the green fly. I am certain that both will kill, but they will not kill where there is not active life. The powers of reproduction in these insects, by eggs, &c., is wonderful. Never could there be a better exemplification of the old proverb, "A stitch in time saves nine." Put off one early smoking and you may have to smoke many times to get rid of the enemy, as fresh myriads come into existence between the smokings, which have no injurious effect on the eggs deposited. The washings are more injurious to them.—R. FISHER.

SPECIMENS IN BOXES BY POST.

I AM constantly noticing in your columns complaints made by yourself and various correspondents that articles sent in a box through the post are rendered useless, or completely destroyed, by the Post-office stampers. I send you by this post a small cardboard box tied round with string, to which a parchment direction label is attached, and upon which label the address is written and postage stamps affixed. If this system were generally adopted in forwarding articles through the post, I have no doubt, from my experience, that they would invariably reach their destination intact.—J. WALDEN.

[Our correspondent is quite right. If the direction and stamps are on a parchment label tied to the box, the Post-office stampers punch the label, and not the box. This box from our correspondent was quite uninjured.—EDS.]

COTTON SEED A PAPER-MAKER'S FIBRE.—A Lancashire paper maker has succeeded in turning to profitable account particular kinds of Cotton seed as a material for the manufacture of the best kinds of paper. The seed is to be obtained in quantities

large enough to supply the wants of all the paper-mills in the country; and it produces a fibre of the finest quality, at a price that will bring it into lively competition with Esparto Grass. Of all the substances hitherto suggested as a substitute for rags, the best practical judges regard this as the most desirable. One important feature in its use is that it necessitates little alteration in the ordinary machinery of paper-mills, while it will in a great measure overcome the difficulty of our river pollution caused by Esparto.—(Bookseller.)

STRAWBERRIES NOT FRUITING.

In reference to the article at pages 7 and 8 of the Journal of July 7th, and the invitation of "R. F.," the author, to others to give their experience, I can attest and endorse his observations throughout. After many failures and close attention I arrived at exactly "R. F.'s" conclusions. It is nonsense to buy or plant the runners of any variety of Strawberry indiscriminately if fruit is expected. The runners, to make fertile plants, must be the progeny of fertile and bearing stools or parents.

My practice is to plant thinly, never nearer than 12 or 15 inches asunder, unless for drawing and thinning-out in the spring to that distance, as some plants will necessarily fail during winter; but ultimately I allow only one plant to every 12 or 15 inches square. Always in the blooming season, May and June, I root out any sterile plant I find, lest a barren stool should go unobserved and produce barren runners. Thus I am sure in the planting season, early in August, in taking runners, to have them off fertile stools. I plant in strong brown soil, trenched and manured as Potato land, and top-dress any standing beds every autumn with rotten litter, after having cleared off runners and weeds, just as with meadow land. I renovate my beds by trenching and planting runners about every third or fourth year, just as I fancy the stools are exhausted or scrubby.

This treatment brings fair crops, though seasons vary—as spring and summer are mild, showery, and bright with sun, or chill, dry, and dull; and varieties differ too, though suitable sorts are by patience ascertained and alone grown. That, every Strawberry-grower must find out as he may be located—north, south, east, or west.—READER.

IRIS GERMANICA AND THE ENGLISH AND SPANISH IRISES.

In No. 483 I see a notice of English and Spanish Irises which were sent you by Messrs. Barr & Sugden. I purchased a number of varieties of the English Iris of the same firm last autumn, which are now in full bloom, and very beautiful they are and much admired, but, although fine, I think they are surpassed by Iris germanica. I have a collection of these, numbering in all about eighty or ninety varieties, and nothing could be more lovely than they were during the month of May. I consider this a neglected flower in one sense, for go where you will you seldom find it grown, or, if at all, not to any extent, and why I cannot tell, as for elegance of form and brilliancy of colour there is, in my opinion, nothing to excel it at the time of year that it is in flower, and when done flowering, its sword-like leaves make a telling variety of form in the mixed border. I was very pleased to see a dozen or so of flowers of excellent colours exhibited at one of the May shows at the Crystal Palace, and still more pleased to see that they attracted much and deserved attention. Let my brother amateurs get a few, and I feel certain that after blooming them one season they will try and enlarge their collection, not only of them—the Iris germanica, but the English, Spanish, and the many other hardy sorts.—HARRISON WEIR, *Weirleigh, Kent.*

THE PRODUCTION OF OZONE.—We have heard so much of late years about the beneficial influence exerted by the presence of ozone in the atmosphere, that even nonscientific readers may like to know how it can be artificially produced. Hitherto, electricity, phosphorus, and permanganate of potash have been the recognised sources of production, but Professor Mantegazza has discovered that it is developed by certain odorous flowers in a still greater amount. A writer in *Nature* states that most of the strong-smelling vegetable essences, such as Mint, Cloves, Lavender, Lemon, and Cherry Laurel, develop a very large quantity of ozone, when in contact with atmospheric oxygen in light. Flowers destitute of perfume do not develop

it, and generally the amount of ozone seems to be in proportion to the strength of the perfume emanated. Professor Mantegazza recommends that, in marshy districts and in places infested with noxious exhalations, strong-smelling flowers should be planted around the houses, in order that the ozone emitted from them may exert its powerful oxidising influence. So pleasant a plan for making a malarious district salubrious only requires to be known to be put in practice.

—M. H., *Acklam Hall, Middlesbrough-on-Tees.*

ARCHIMEDEAN LAWN MOWER.

I HAVE read with interest all that has been said in the Journal about the Archimedean lawn mower; and now I wish to say a few words concerning that machine, having had one in use here all this season.

"D. A.," *Norfolk*, writing in praise of the Archimedean, says, "I approve of the machine for the following reasons:—First, that it will do more work and do it with far greater ease than any other I have seen." I imagine "D. A." has not used many mowers, if he had I am quite sure he would not say the

Archimedean was so easy and so very perfect. Secondly, "D. A." says, "It will cut any length of grass with ease." Now, as I have used it on short and long grass, I say it will not cut it with ease.

I can truthfully say the Archimedean is not to be compared with Green's machine for excellence. It is very inferior to that very excellent machine. An Archimedean that cuts only 14 inches requires two strong men to work it, and it is then hard work, for it must be worked with great speed to get it to cut at all, for if worked slowly it slips over the grass, and leaves it uncut. Again, it quickly gets clogged, through the cut grass working itself through the rollers and getting in between the driving gear. It frequently occurs that I am compelled to stop mowing on purpose to take the machine to pieces to clean it before I can go on mowing, and the smallest stick or stone coming in contact with the cutters leaves a large notch in them; then, of course, it cuts in such places no more. The blades of my machine are notched and look like a saw. It ribs the grass badly, and it does not cut nearly so evenly as Green's or Shanks's machines, while it slips over and leaves uncut such things as Daisy and Clover flowers. Then you cannot cut close to any path or flower bed, or cut verge at all, while you can do so with all the other machines that I know. If there is the smallest breeze it scatters the grass all over the beds and flowers.

In conclusion, I say, putting together the time it takes to clean and grind the Archimedean, and that spent in sweeping the lawn, which you do not want to do with Green's and Shanks's machines, the mowing occupies double the length of time.—*Vitis, Highgate.*

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

VANDA CATHARTI (Mr. Cathart's Vanda). *Nat. ord., Orchidaceæ. Linn., Gynandria Monandria.*—"By far the noblest species of the noble genus." Flowers large, yellow ground, barred very numerously with bright brownish red. Native of the Himalayas.—(*Pot. Mag.*, t. 5845.)

DRACÆNA CYLINDRICA (Cylindric-spiked Dracæna). *Nat. ord., Asparaginaceæ. Linn., Hexandria Monogynia.*—Native of the banks of the Old Calabar River, West Africa. Flowers white, bracts brownish purple.—(*Ibid.*, t. 5846.)

IRIS IBERICA (Iberian Iris). *Nat. ord., Iridaceæ. Linn., Triandria Trigynia.*—A gigantic-flowered dwarf. Outer perianth leaves white; inner perianth, yellow ground densely barred with purple, humped bases of stigmas dark purple. Native of the Iberian provinces of the Caucasus.—(*Ibid.*, t. 5847.)

ANTHURUM ORNATUM (White-spathed Anthurium). *Nat. ord., Orontiacæ. Linn., Tetrandria Monogynia.*—Native of Venezuela. Spadix dark purple, dotted with white; spathe large and white.—(*Ibid.*, t. 5848.)

SAXIFRAGA ARETIODES (Aretia-like Saxifrage). *Nat. ord., Saxifragaceæ. Linn., Decandria Digynia.*—Native of rock-crevices in the Pyrenees. It is hardy. Flowers yellow.—(*Ibid.*, t. 5849.)

BRODIAEA COCCINEA.—"A beautiful new hardy bulb imported by Mr. W. Thompson, of Ipswich, from the Trinity Mountains, California, and by whom it was exhibited at South Kensington on the 8th ult., when it received the well-merited reward of a first-class certificate from the Royal Horticultural Society's Floral Committee.

"This *Brodiaea coccinea* produces a flower-scape of from 2 to 3 feet in height, and accompanied by channeled leaves of nearly the same length. The flowers are nodding, and borne in a terminal umbel of from five to twelve, or even fifteen to twenty, when established and vigorous. The flowers themselves are about 1½ inch long, on pedicels nearly an inch in length, and are ventricosely cylindraceous and obscurely ribbed, the tube for about an inch at its base being of a rich magenta-crimson, while the upper part and the six recurved limb segments are externally pea-green, somewhat paler internally. The three exterior petaloid stamens are greenish white, much broader than the perianth segments, and forming a kind of coronet at the mouth of the tube. The three perfect stamens and the trifid stigma are about as long as the perianth.

"As regards its cultivation, we learn from Mr. Thompson that it appears to be perfectly hardy when planted deep enough to be beyond the reach of frost, and, moreover, that when planted in a clump of five or six roots it has a most striking appearance. With him it has hitherto been grown with very good success in loamy soil, but it should be well drained. The

flowering season is May and June. It promises to increase freely, and unlike some of the allied genera, its bulbs do not dwindle, but with ordinary care increase in vigour annually."—(*Florist and Pomologist*, 3 s., iii., 145.)

ENTOMOLOGICAL SOCIETY'S MEETING.

THE last meeting of the present season was held on the 4th inst., the President, Mr. A. R. Wallace, in the chair. The Secretary announced that the second part of the Transactions of the Society for the present year was ready for delivery to members.

Mr. Meek exhibited specimens of Noctuida, *Dianthæcia conspersa* and allied species, from Ireland and the Isle of Man, together with what appeared to be a very remarkable variety of *Glupispia crenata* from the latter locality. The Hon. T. De Grey exhibited *Oxyptilus lactus* from Suffolk; and Mr. Moore a portion of the stem of a creeper, *Coccolus microcarpus*, from Bombay, deformed with a large swelling, within which was a cavity containing three contiguous cases or cocoons enclosing the perfect beetles of a species of the curious thick-legged genus *Sagra*.

Mr. Blackmore exhibited several boxes of insects collected by himself during the past winter and spring in Tangiers, amongst which were a series of specimens of *Anthocharis Eupheno*, and a monstrous specimen of *Pimelia scabrosa* with one of the antennæ bifurcate from the second joint. Mr. J. J. Weir sent some further observations on the relation between the colour and edibility of Moths and their larvæ. Thus the remarkably coloured caterpillars of *Cnecilia Verhasci*, one of the Spark Moths, were not only eaten as soon as their colour was developed, but the perfect moths were eaten. Hairy larvæ were avoided by birds, but other coloured larvæ appeared to enjoy immunity on account of their colour.

The President read an extract from a letter from Borneo detailing instances of protective mimicry in two species of Spiders, one of which closely resembled the dropping of a bird. The Hon. T. De Grey stated that he had observed that the caterpillar of the *Cinxia Fritillaria* not only resembled the leaf of the Narrow-leaved Plantain, on which it feeds, but the chrysalis is just like the seed of the same plant.

Mr. Albert Muller exhibited some imbricated galls on *Ammophila arundinacea* from Aberdeen, made by an unknown insect. Mr. Tegetmeier exhibited some impressions of Lepidopterous insects, made by transferring the scales to paper and colouring the body, and which had been sold as a new species of lithographic printing.

Professor Westwood made some observations on some minute Acari found in the unopened buds of Black Currant trees, with an elongated cylindrical body and only four legs, and another species which forms small pustules on the leaves of Pear trees; these, with a third species which inhabits galls on the leaves of Lime trees, described some years since in France, he regarded as constituting a distinct tribe in the Acaridæ, and for which he proposed the name of *Acarellus*. [The Professor has, however, subsequently ascertained that Du Jardin (not Dejean, as stated by Mr. A. Muller), has formed these insects into the genus *Phytoptus*, regarding them as full-grown animals, whilst a still more recent writer has described them as the larvæ of an 8-legged genus of Mites named *Typhlodromus*.]

The Secretary exhibited the woolly Oak galls of *Cynips Ramuli*, with the Gall-flies bred therefrom, communicated by Sir J. C. Jervoise from Horndean.

Mr. Bates communicated a memoir, being the continuation of his "Enumeration of the Longicorn Beetles of the Amazons, containing the family *Cerambycidae*." There were also read a memoir "On a Collection of Butterflies sent by Mr. Ansell from South-western Africa," by Mr. A. G. Butler; and "A List of the Hymenoptera captured by Mr. J. K. Lord in Egypt and Arabia, with descriptions of the new species," by Mr. F. Walker.

THE AMATEUR GARDENER.

(CHAPTERS NOT IN WALTON.)

No. 3.

RUSTICUS.—See here, *Civis*, these poles and festoons of Ivy have an admirable effect; they are quite a new feature to me in garden decoration.

HORTATOR.—Nothing can be more simple. The poles, you see, are made of Larch wood, with the bark upon them. Before their insertion in the earth they should be partially burnt at the bottom, and have a painting of gas tar to prevent their rotting in the ground. A slender iron chain, which can be purchased at any ironmonger's, is then fastened upon them, letting it hang down in festoons between the poles, which should be about 10 or 12 feet apart. Plant your Ivy against them—prefer strong plants of the Irish—in good rich loam, and supply them during the growing season with plenty of water; if a little quano be added to it twice a-week all the better. The Ivy will then soon run up the poles, and can be trained and tied to the chains.

SYLVA.—Should you be tempted to imitate such an ornament, *Civis*, I would venture to suggest an improvement by

planting some *Wistaria sinensis*, with which even you, townsman as you are, must be well acquainted. I cannot imagine a more elegant, ornamental design than these festoons of Ivy, gracefully interwoven with the *Wistaria's* lovely pendulous racemes of flowers lightly tied-in with the Ivy.

RUSTICUS.—But are you sure of its being hardy? I have never seen it except when growing on a wall.

SYLVIA.—I am quite sure of its hardiness, for I have known it growing as a standard in most exposed situations with perfect immunity. Let me remind you that the success of this ornament depends greatly upon its being placed in an appropriate position.

CIVIS.—But is not the flower of the *Wistaria* very short-lived? I only remember to have seen it for a very brief time in spring.

HORTATOR.—*Sylvia's* idea is an excellent one, and your objection is plausible; but the *Wistaria* does flower to a certain extent a second time in the autumn, and by a judicious thinning-out of the flowers in the spring, and especially by their removal when faded, this second flowering season might be considerably increased and lengthened; but the foliage is in itself very elegant, and its peculiar green would well comport the Ivy.

RUSTICUS.—Permit me to make a suggestion. As the Ivy, even with careful attention, must take some time to run up the poles and cover the chains, might not some of the elegant Clematises, of which there is now such a variety, be used?

HORTATOR.—Undoubtedly, and any of the rapid-growing annual climbers might also be employed. One root of Ivy only need be planted, so that the other side of the pole might be used as suggested.

RICHARD.—Will you permit me to say, gentlemen, how we keep the Ivy so well regulated, and the leaves so fresh and green?

CIVIS.—The very inquiry I was about to make.

RICHARD.—Well, then, I simply take a pair of garden shears in March and cut off nearly every leaf, and as that is the season in which it begins to grow, it only remains bare a very short time, and is quickly again covered with new green leaves, and is not permitted to grow too heavy or cumbersome-looking for the chains.

SYLVIA.—But there is a slight shower of rain; I, at least, must take shelter a moment in this evergreen arbour.

CIVIS.—What music there is in the sound of those rain drops falling so gently on these Laurels, suggesting thoughts of invigorating freshness! But see! what is that thrush about on that gravel walk, thumping his beak so violently upon a stone?

SYLVIA.—As the rain has a little abated, let us approach a little nearer and see. Nay, friend *Civis*, you will not alarm him, birds are so accustomed to be well treated in our garden, that they are not the same timid, shrinking creatures that they are in many.

RUSTICUS.—See, he is breaking the shell of a snail by repeated thumps on the stone, and is preparing a rich feast for his hungry nestlings.

HORTATOR.—And thus relieving us of one of the worst of the many enemies of which gardeners have to complain. I have had to fight many a hard battle with *Richard*, until I appeased his wrath by purchasing some netting to protect the Strawberries; but even now I believe he would gladly extirpate their nests did he not know that such a robbery would involve his dismissal.

CIVIS.—And is the netting expensive?

RUSTICUS.—That is a question which I can answer, having just purchased an ample supply at one penny the square yard, cheap enough you will acknowledge, and readily obtained.

CIVIS.—How beautiful that ray of sun light, now that the shower is over, slants between the branches of that elegant shrub, with its pendulous branches sweeping the lawn with its kirtle of green like a fairy queen on the day of her coronation! What is its name?

HORTATOR.—That is the *Cedrus Deodara*, a native of Nepal, introduced into England in 1822.

RUSTICUS.—And which I believe not many years hence is destined to effect a wonderful change in the English landscape, for I am greatly mistaken if it will not supersede the Larch and Fir, being much better suited to England from its freedom from disease and perfect hardihood, except in very draughty situations.

SYLVIA.—And what an elegant contrast it forms to its brother of Lebanon; the one light, pendulous, and drooping, the other dark, solemn, and majestic.

RUSTICUS.—The rays of the setting sun remind me that it is time that *Civis* and I must say farewell, and thank you for this delicious stroll.—**HORTATOR.**

INSECTS INJURIOUS TO THE PEAR TREE.

No. 4.

ZEUZERA ESCULI, WOOD LEOPARD MOTH. It has been called by entomologists *PHALENA NOCTUA ESCULI*, *P. NOCTUA PYRINA*, *BOMBYX ESCULUS*, *B. PYRINUS*, *PHALENA COSSUS*, *P. BOMBYX ESCULI*, and *COSSUS ESCULI*.

We have just received the following communication:—

"I am sorry to say we are much infested here (Ilford, Essex) with a tree-boring grub. I have just cut out six of these grubs from as many Pear trees in Mr. Thompson's young orchard plantation of pyramids. They also attack the Apple and Quince trees as well as the Pear. In the course of last year I cut out as many as twelve or fourteen from the three sorts of trees mentioned. They usually attack the main stem of the tree, and are, as you are doubtless aware, very destructive, frequently eating away almost the entire substance of the wood, so that a high wind breaks it completely off, perhaps not more than 9 inches or 1 foot from the ground, and sometimes 3 or 4 feet from the bottom.

Mr. Thompson wrote me in 1868 saying that you had promised to pay a visit here to view the young orchard. I trust such visit has not been abandoned, as I think you would be pleased with the trees, of which we have now about 2050, all pyramids, and of which this is the fifth summer. The Apples have hitherto borne but little, but the Pears have done so for several years, and we have this year a very fair crop of *Louise Bonne* of Jersey and *Beurré d'Amanlis* Pears."

The grub enclosed was the caterpillar of the Wood Leopard moth, *Zeuzera esculi*.

From the end of June to the commencement of August, according to the temperature of the season, this moth may be found clinging to trees, especially the Lime. Its specific name, from *Esculus*, a Horse-chestnut, is singularly inapplicable, as it frequents that tree less than any other. It is white, covered with bluish-black spots, as represented in our drawing; the antennæ short, tapering to a fine point. The female is fully twice as large as the male, often measuring nearly 3 inches across the expanded fore-wings. She is also easily distinguished from the male by having her antennæ only woolly at their base, but at the upper part simple; whereas the antennæ of the male are feathered at the base on each side. The thorax is white and woolly, marked by six blue-black spots. She is furnished with a long ovipositor, or egg-depositor, admirably adapted for inserting her eggs in the cracks of the bark of trees, on the wood of which the caterpillar feeds. To the Pear, Apple, Hazel, Walnut, Elm, Lime, and other trees, even the Holly, it is most destructive, burrowing holes into them, destroying their sap vessels, and forming reservoirs for wet to lodge in and promote decay.

The caterpillar is white, tinged with yellow, and spotted with black; its head being horny, with black patches upon it, and on the segment of the body next to it. Its length is about 2 inches when full grown. It is hatched in August, and attains its full size in the June following. It then enters the pupa state, becoming a reddish-brown chrysalis, in a cocoon formed of the dust of the wood which, as a caterpillar, it gnawed down in working its passage. From this cocoon, as already stated, the moth comes forth, either at the end of June or some time between that and the beginning of August.

The chrysalis is of a reddish-brown colour, and has a cylindrical longish body, the abdominal segments with transverse rows of small points directed backwards, by which it is enabled to push itself forward to the outlet when ready to assume its imago or moth form. The head of the chrysalis is armed also with a short hard point, by which it opens a way to escape from the cocoon. Our *fig. 3*, for which, as well as for the other cuts, we are indebted to Professor Westwood's drawing in the "Gardeners' Magazine of Botany," represents a chrysalis case from which the moth has escaped by a slit down the front part of the upper side, and by the head-piece becoming detached.

In making its attacks, the caterpillar generally perforates a hole in the side of a branch, and eats its way upwards in a perpendicular direction, following the course of the pith; but in a case we have seen exhibited by F. J. Graham, Esq., of Cranford, the insect, instead of taking at once a perpendicular course, ate its way all round a branch, keeping just under the

surface of the bark, and devouring the wood to such a depth that the limb was weakened and blown off by the wind. After making its horizontal circuit it then worked its way perpendicularly in the ordinary way.

Fig. 1.—The female moth, life-size, with her ovipositor protruded.

The way generally recommended for the destruction of this devastator, is to blow tobacco smoke into the holes. This might do very well in cases where the insect is near the orifice, and the burrow is shallow; but in cases where it extends to the length of 1, 2, or 3 feet, it will be impossible to reach it by this

Fig. 2.

Fig. 2.—The caterpillar within the tunnel it works in the tree. The roundish mass beneath the caterpillar is the woody dust it leaves behind, and of which it forms its cocoon.

mode. The only sure course which suggests itself is to wait till the period in June, when the grub has gone into the chrysalis state, and its powers of further destructiveness have ceased, and then to plug up the holes. This will either suffocate it, or it will effectually prevent it from emerging, as in the imago state it is incapable of eating its way out. In this way the reproduction of that individual at least would be prevented. The common house sparrow is a great enemy of this moth.

FORMING A FLOWER GARDEN.—No. 2.

THE DESIGN.

VERY complicated geometrical patterns are, as a rule, to be avoided, for unless the resources of a garden are fully equal to its requirements such designs are rarely to be seen without some flaw in the colouring, or some bed whose ragged appearance tells of a failure in the supply of plants in spring. It is well, therefore, when deciding upon a design, to bear in mind

the means which the gardens afford of filling the beds satisfactorily. A few well-filled beds are far preferable to the most elegant design to which the gardener is unable to do full justice from insufficient means. Moreover, the design of a flower garden should be strictly in keeping with its surroundings; for instance, a terrace garden with its formal accessories should certainly be severely geometrical, while in a shrubbery garden a somewhat more irregular style might be adopted with advantage. As a fair example of this style I give the plan of the flower garden at Egerton House. It is about half an acre in extent, and is in the centre of the shrubbery. The centre of the garden is traversed by a wide walk leading from the house to the bottom of the pleasure grounds, and when the garden was made, a circular space 60 yards in diameter was allowed, but the walk was to be retained, as well as the two large Oaks, one on each side of it, so that a suitable design had to be worked out in such a manner that the shade of the Oaks might be avoided as much as possible. In practice I have found the accompanying plan answer very well; and it is worthy of note here that the plants in the large circular beds 17 and 42 are invariably of the kinds known as fine-foliaged plants. A line of *Christine Pelargonium* between the inner band of *Gnaphalium* and the *Farfugium* has been tried, but was not very successful. From my experience of these beds, I would never depend on anything but fine-foliaged plants in beds at all shaded by trees.

Another important point is the maintenance of a sufficient proportion of turf among the beds, which should not be crowded, but should have a sufficient breadth of nature's green around them to afford an agreeable relief, whereby the brilliancy of their colours will be much enhanced. To no style does this principle more forcibly apply than to those large single beds from 50 to 100 feet in diameter which are occasionally to be met with; such beds are a flower garden in themselves, and when skilfully managed are very beautiful, but to be effective they require a wide expanse of turf around them; for if large beds, like these, are placed in a confined position, surrounded by shrubs or narrow walks, they are far more likely to strike the eye as huge blotches than as masses of floral beauty.

With regard to the shape of flower beds, sharp angular forms are to be avoided as far as practicable, as they are difficult to fill well, and their hard abrupt outlines stand out boldly and uncompromisingly. Very different from this is the soft flow of a scroll partaking of the character of Hogarth's line of beauty, or the graceful sweep of a circle, pleasant to look upon from whatever side it is viewed. Scroll patterns, however, though very beautiful, must be adopted with caution, as in most instances, to do full justice to their graceful outlines, more space is required than for any other style; for if the curves of the scrolls approach each other so closely as to leave but little space for turf or gravel, the colouring is apt to appear crowded and confused.

THE PLANTS.

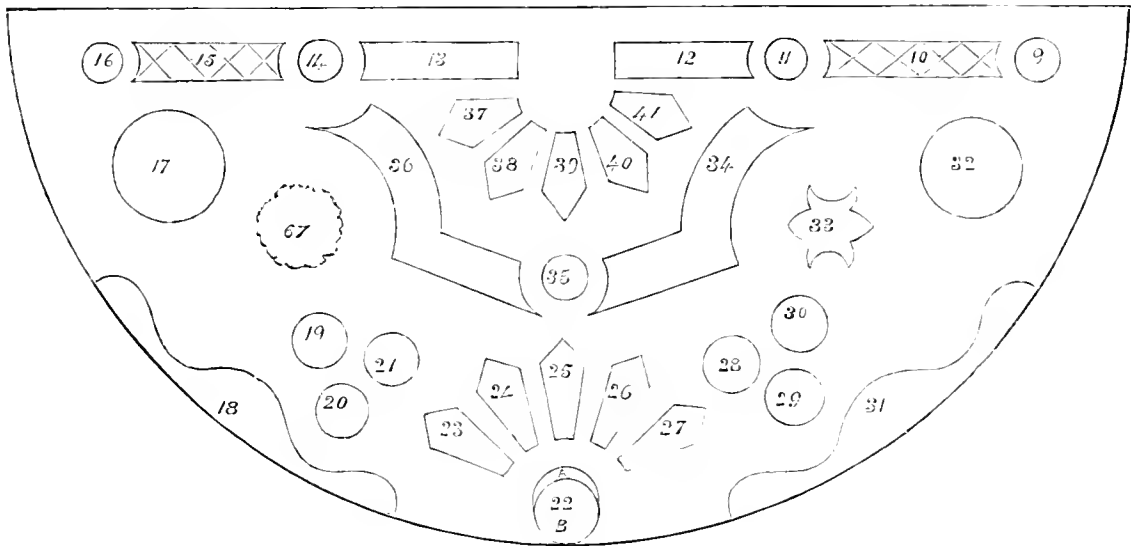

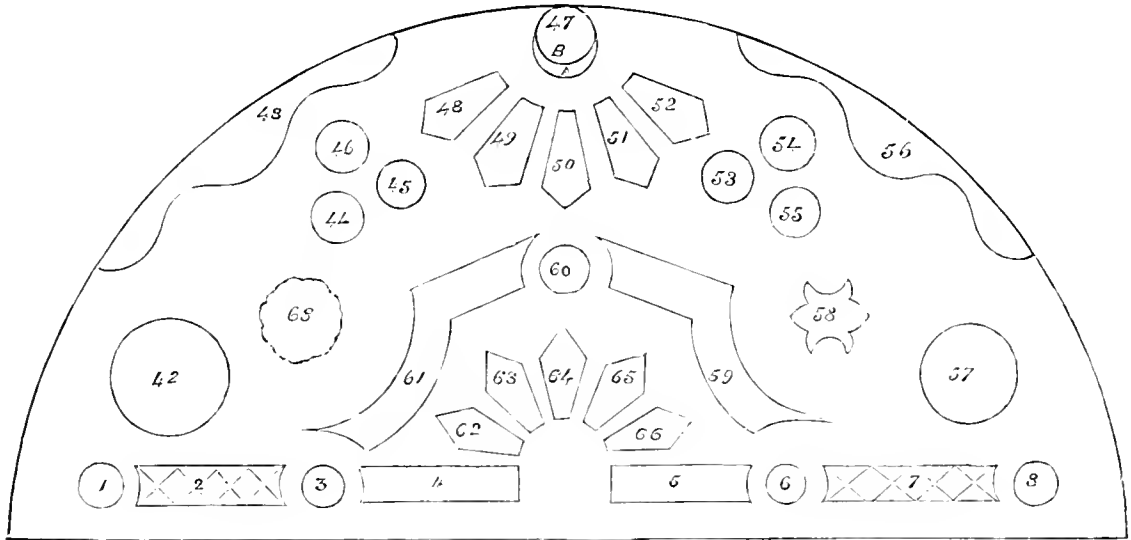

In a selection of the most suitable plants for flower beds, many kinds grown entirely for the beauty of their foliage justly claim a leading position, and from their undoubted excellence and great utility we gladly accept and welcome them as almost indispensable aids in enabling us to carry out our designs. Their excellencies are many. They offer to the artist many shades of colour not to be obtained from blossom; some soft and subdued charming neutral tints which are most useful to tone down or divide the glowing brightness of their more showy neighbours; while others, by their bright and gorgeous colouring, not only rival the gayest flowers, but owing to their greater stability and immunity from many of those evils to which the blooms from their frailty are liable, not unfrequently take the place of flowering plants, and in some gardens to a much greater extent than I like to see; for, after all, the blossoms of flowers possess a soft and refined beauty unapproached by foliage, and therefore the more flowering plants we can introduce with safety the more general will be the appreciation of the entire design.

GREY-LEAVED PLANTS.—To our old friend *Cerastium tomentosum* must be awarded the leading position as the best dwarf plant of its colour for an edging or front row. When well managed nothing can surpass it, as it makes a dense growth, yet is prevented by its multitudinous leaves and shoots from appearing at all heavy, and it becomes a neat compact mass of pearly grey, which is most effective next to turf. *Cerastium* should always be transplanted once a year; it strikes root freely from cuttings in the open air in spring and autumn, and such young plants are best, as they quickly meet if planted an inch or two apart, but if old plants are retained

they should be lifted early in March, and the soil either renewed, or renovated with leaf mould or rotten dung. Planted in his, the old plants grow throughout the summer with renewed vigour; but if this is not done, and they are kept in the soil for two successive seasons, they suffer very much from

the heat during the second summer, and brown leaves and a starved appearance are the results.

Cerastium Biebersteini I do not like so well, though it is useful for an edging to large beds or bold masses of foliage; but even for such a purpose it is surpassed in the opinion of

FLOWER GARDEN AT EGERTON HOUSE.

1, 16, 8, 9. *Haliotrope Beauty of the Boudoir*.
 2, 15, 7, 10. The diamonds are marked out with *Vinca major elegantissima*. Inside the *Vinca* in the diamonds is a row of *Iresine Herbertii*, and the centre of each diamond is filled with *Pelargonium Crystal Palace Gem*. The four central half-diamonds contain *Lobelia speciosa*, and the remaining three at each end are filled with *Pelargonium Adonis* or *Little David*.
 3, 14, 60, 6, 11, 35. *Cerastium tomentosum* next the turf, *Pelargonium Christine* in the centre.
 4, 5, 12, 13. A row of *Centaurea ragusina* down the centre, a row of *Coleus Verschaffelti* on each side of the *Centaurea*, with a row of *Lobelia speciosa* outside of both rows of the *Coleus*, making five rows in all.
 34, 36, 53, 61. Three rows of *Pelargonium Mrs. Pollock*, forming a broad band along the centre of each bed, with *Lobelia speciosa* on each side.
 33. *Pelargonium Stella*. 64. *Pelargonium Cybister*.
 37, 41, 62, 66. *Pelargonium Minimum Nesegay*.
 38, 40, 63, 65. *Pelargonium Flower of Spring* (silver variegated).
 17, 42. These beds are shaded very much by the large Oak trees, 67 and 68, they are therefore always filled with fine-folliaged plants in the following way.—A broad band of *Gnaphalium laetum* next the turf, next this is an equally broad band of *Iresine Herbertii*, then comes a narrow band of *Gnaphalium laetum* surrounding the central mass of *Farfugium grande*.

33, 58. Mixed *Verbenas*.
 32, 57. These beds have a large mass of *Gladiolus Breuchleyensis* in the centre, surrounded by a row of variegated *Ageratum*; next this is a row of *Coleus Verschaffelti*, with a row of *Pelargonium Mrs. Pollock* next the turf.
 22, 47. In these beds is a broad band of *Pelargonium Golden Chain* at A, not taken all round, but narrowing off, as shown in the plan, and the remainder of the beds, B, contains a bold mass of scarlet *Lobelia*.
 25, 50. Silver-variegated *Pelargonium Perfection*.
 24, 26, 43, 51. *Verbena Purple King*.
 23, 27, 48, 52. Variegated *Pelargonium Manglesii*.
 29, 54. *Calceolaria Aurea Floribunda*.
 20, 46. *Calceolaria Prince of Orange*.
 19. *Pelargonium Amy Hogg*. 21. *Waltham Seedling Pelargonium*.
 28. *Pelargonium Rebecca*. 31. *Pelargonium Provost*.
 59. *Pelargonium Black Dwarf*. 55. *Pelargonium Lady Constance Grosvenor*.
 44. *Pelargonium Sir J. Paxton*. 45. *Pelargonium Le Grand*.
 The side beds 18, 31, 43, 56 have three rows in front, the first of *Centaurea ragusina*, the second *Perilla*, and the third either a yellow or orange *Calceolaria*. These three rows stretch from end to end of the beds, just filling the narrow parts, and in the remaining spaces are grouped scarlet and crimson varieties of *Pelargoniums*.

many by *Gnaphalium lanatum*, a strong-growing but most useful plant, as, owing to the trailing recumbent character of its long flexible growth, by close attention to pinching and pegging it becomes one of our neatest bedders. Its handsome foliage, of a peculiar soft grey tint, is very telling next deep crimson or pink. One other grey-leaved plant, *Centaurea ragusina*, will complete my selection. It is the best plant of its class for a central, or third or fourth row. It is quite hardy, but as neat young plants are altogether preferable for bedding purposes, an annual supply must either be raised from cuttings or seed. By making cuttings as early in July as possible, and keeping them in a moderate even temperature, they will strike root as freely as a *Pelargonium*. If the stock is obtained from seed it must be sown in January, as the seedlings are very green at first, and require a considerable time before they equal in appearance plants raised from cuttings. For my own part, I very much prefer cuttings, for when once well rooted they may be wintered with the greatest ease in a dry cold pit. Cuttings of this plant also root in a brisk moist heat in spring.

I have selected these plants as being decidedly the best of all in their section; they are of the highest excellence, their merits having been thoroughly tried and their stability proved in a variety of seasons.

CRIMSON-LEAVED PLANTS I shall take next. *Coleus Verschaffelti* worthily comes first, for now the excitement caused by the much-vaunted splendour of its descendants has subsided, our old favourite remains master of the field, the splendour of its rich-coloured foliage never having been approached, much less equalled by any of them. And here I would observe, that my experience of this class of plants leads me to the conclusion, that no fine-foliated plant possessing maculated leaves is ever so useful as those of a rich self-colour for bedding purposes. I have tried most of the new varieties of *Coleus*, and find that while *Verschaffelti* is undoubtedly the best for forming rich masses, or as lines in a ribbon border, yet nearly all the newer kinds are useful if grown in pots, trained in a conical shape 2 or 3 feet high, and then turned out into beds to form mixed groups, or as a background for brighter colours.

Of the *Iresines*, *acuminata* has fine, broad, handsome foliage, and will very likely supersede *Herbstii*, but of this I am by no means certain, as *Herbstii* is a fine plant when grown in a deep, rich, cool soil. It is most effective when next foliage of a similar character, such as that of *Vinca major elegantissima*, or *Gnaphalium lanatum*. Of *Lindeni* I must not yet venture to offer an opinion; if its very elegant foliage only prove bright enough in colour it is likely to be a great acquisition. *Anarranthis melancholicus ruber* grown in a warm, sheltered situation, and pegged closely, makes a fine crimson mass, and is very telling next bright yellow. *Perilla nankinensis* with its rich, dark, chocolate leaves, often changing to a fine bronze in autumn, is a first-class bedding plant; its young stems are very flexible, so that it may either be pegged closely and kept pinched to form a dwarf edging, or it may be had of any height up to a foot.

GOLD AND SILVER VARIEGATED PLANTS.—Among these we have in the very elegant *Arabis lucida variegata* a perfect gem, not more than 2 or 3 inches high, and quite hardy. *Arabis alpina variegata* is also useful. It is a stronger grower than the former. Cuttings made in October and wintered in a cold pit, make useful plants for the following summer. Next these comes *Polemonium caruleum variegatum*, a beautiful silvery-variegated hardy plant, with elegant Fern-like foliage. This is one of the most useful plants in its section; it is best propagated by division of the crowns in spring, and in order to increase the stock quickly the plants should be potted in autumn, and wintered in a cold pit. Another useful plant is *Koniga variegata*. I have frequently used this between plants of *Lady Plymouth Pelargonium*; it grows quickly and has the appearance of a fringe of lace around the *Pelargoniums*, and is easily cut away as the *Pelargoniums* make growth. *Vinca major elegantissima* is a valuable bedding plant, which by judicious pinching and pegging becomes a sheet of pale yellow a few inches high. It requires constant attention, as it grows quickly, but it well repays one for all the care bestowed upon it. *Chrysanthemum Sensation* and *Ageratum variegatum* are alike useful; both are easily propagated, and both bear pegging and pinching well. The Variegated Japanese Honeysuckle (*Lonicera aureo-reticulata*) also makes an elegant bedding plant, if propagated in spring, potted singly in 3-inch pots, and kept in heat and with the growth constantly pinched, so as to form the plants into neat, compact, little bushes. These do

admirably for a line in a ribbon border, but they require constant pinching throughout the summer. All plants of this kind possessing a long trailing habit should never be suffered to produce long shoots when planted in flower beds, but should, by pinching-off the tips of the young growth, be brought as near to the appearance of a regular bedding plant as possible.

MISCELLANEOUS PLANTS.—Of these, *Heliotrope Beauty of the Boudoir*, with its very dark foliage and abundance of grey flowers, forms charming neutral beds. To have this in bloom early, the plants must be propagated the previous autumn and wintered singly in thumb pots. Spring-struck plants are frequently as large when planted in the beds, but they are much later in coming into flower.

The tall *Scarlet Lobelia* are good in groups, or for back rows in ribbon borders; they do not open their flowers, it is true, till late in the season, but their dark stems and foliage are very effective, and when the spikes of deep rich scarlet flowers do expand, nothing can be finer, and yet how seldom are they seen. Their culture is most simple; pack the old stools closely in pans or boxes in autumn, winter in a cold pit, avoiding much damp, and early in March divide the old plants, potting the offsets singly in small pots. These, placed in any position under glass where they can have abundance of light and air, as in a pit, frame, or cool house, become nice plants by May. Care must be taken to guard them from the ravages of snails, which are very fond of the young succulent shoots.

Another useful member of this family, of more lowly growth, is *Lobelia speciosa*. Coming early into bloom, and continuing in great beauty throughout summer, it forms a dense even mass of deep blue, and is everywhere welcomed and admired. It may be useful to some if I advert to two or three different methods of culture. The simplest way of all to obtain a stock is to sow a bed on a warm border early in September. The young seedlings are protected in winter with a frame having glass lights, which are covered with mats and litter in hard frosts; the plants are slightly thinned, but nothing more is done till they are taken up with a trowel and planted in the flower beds in May. This plan answers very well for gardens in which an early display is not required, otherwise the usual plan of sowing seed in pans placed in heat in March is preferable. In gardens having very poor soil, where strong plants are required, I know no better way than to place a glazed frame on a mild hotbed, fill it to within 3 inches of the glass with light, rich, sandy soil, settle this gently down with the back of a spade, and prick out the young seedlings 2 inches apart. Wash the glass lights with a thin mixture of lime and water for shading, sprinkle the plants twice a day with warm water, and give a thorough watering when necessary, and a little air on hot days. When the plants are growing freely, more and more air may be given, till the lights are drawn entirely off, care being taken that the tender foliage is not scorched by the sun. Seedlings so treated grow with amazing rapidity, and some care has to be exercised that the plants do not become too robust, and so, when removed to the flower beds, continue to grow too strongly.

The method I prefer to all others is to select a dozen or two of plants from a late batch of seedlings or cuttings, to pot them singly in 3-inch pots, and plunge them in the open garden till the end of August, when they are taken up and shifted into 5-inch pots, and then plunged to the rim in coal ashes till October; they are then taken into the houses along with the other bedding stock. In the following February they are furnished with a good crop of cuttings, and the required quantity of young plants is raised with the greatest ease. By shifting the stock plants in the end of August, ample time is afforded for them to become thoroughly established in the 5-inch pots before they are housed. I lay some stress on this, because *Lobelias* shifted late in autumn are very liable to damp off.

Viola cornuta is another very useful summer plant of most easy culture. In order to insure a lasting summer display, cuttings must be taken in March, and the young plants planted in the flower beds in a deep rich soil at the same time as the other bedding plants. It grows freely, and soon becomes a mass of bloom of a peculiarly fresh and pleasing appearance.

This selection of plants may be thought a small one, but if to these are added the splendid varieties of bedding *Pelargoniums* now in cultivation, together with *Verbenas* and *Calceolarias*, ample materials of all shades of colour may be had in sufficient variety to fill a design, however large, in the most satisfactory manner. Of the relative merits of *Pelargoniums*, *Verbenas*, and *Calceolarias* I shall say nothing, as they have been fully treated of in former papers, but will next proceed to

consider the arrangement of the plants.—EDWARD LUCKHURST, *Egerton House Gardens, Kent.*

NOTES AND GLEANINGS.

THE third Show this year of the ROYAL OXFORDSHIRE HORTICULTURAL SOCIETY, will be held on Tuesday, July 19th, and three following days, in the Observatory grounds, Oxford, by kind permission of the Radcliffe Observer, and the amounts in prizes offered are as follows—viz., for Plants, £35 7s. 6d.; Cut Flowers, £26 3s.; Fruit and Vegetables, £12 12s.; Cottagers' prizes, £36 17s. 6d.; in all £120 10s. The ROYAL HORTICULTURAL SOCIETY will hold their fourth provincial Show at the same time and place, and prizes amounting to nearly £800 will be given away. The band of the Royal Artillery from Woolwich will play daily under the direction of Mr. J. Smythe, as well as the band of the Oxfordshire Militia. The following railway companies have kindly consented to convey plants from the Exhibition free of charge, providing they remain the property of the person who transmitted them to the Exhibition—viz., Great Northern, Great Western, London and North Western, London and South Western, and Midland. The Exhibition will be open on Tuesday, the 19th July, at 2 o'clock P.M., and on the three following days at 10 o'clock A.M. The terms of admission are—for the first day, 3s. 6d. (if purchased on or before Monday, July 18th); on the days of Exhibition, first day, 5s.; second day, 2s. 6d., third and fourth days, 1s. Gardeners can obtain admission as follows—on producing their masters' cards—viz., first day, 2s. 6d.; second day 1s.

— THE FRUIT COMMITTEE of the ROYAL HORTICULTURAL SOCIETY will meet at Oxford on Wednesday next, July 20th, at 11 o'clock A.M., to examine such fruits and vegetables as may be sent for their opinion.

— THE drought has been so great about London, and forage so scarce, that cow-keepers are eagerly purchasing the weeds grown in the Royal Horticultural Society's garden at Chiswick, for cattle food. The weeds are unusually fine, certainly, having been undisturbed for the last year or two; and it is gratifying to see how even its misfortunes can be turned to good account for the Society's benefit.

— THE "German village" trees have again made their appearance in Trafalgar Square, dotted about much in the way children do their mimic toys. Is it solicitude for the beauties of the National Gallery that these terrace trees are not placed on the only public terrace London possesses? or is it that those in authority do not know how to make the best use of the objects they are entrusted with? Last year we suggested that some of these trees should be placed on the terrace above, where they would form an effective line of green in front of the National Gallery; but we presume some arbiter of taste directs the decorative department of the metropolis who knows better.

WORK FOR THE WEEK.

KITCHEN GARDEN.

SEE that in this department weeds are not allowed to seed amongst growing crops, such as Potatoes and Asparagus, where, from the luxuriance that surrounds them, they are apt to elude detection till they have deposited their seeds; attention in proper time to such matters entails not one-tenth of the labour that neglect ultimately does. As soon as caterpillars attack any of the *Cabbage* tribe, give a slight dredging with white hellebore powder in the morning. Make a sowing of East Ham Cabbage for early spring use, and a late sowing of Coleworts. Pay strict attention to early crops of Celery; let them be gone over with the hand, and all offsets taken off, and where practicable let it have a thorough drenching with dung water, after which, on the following day, give a slight earthing-up to prevent evaporation. Plant out succession crops of it. People sometimes complain of their Celery "running;" Celery plants removed in a gross state need little more than drought to bring on the flowering habit. Sow another bed of *Endive* forthwith. Make a small sowing of Early Frame Peas. If the autumn be fine, they may be useful. Make a sowing of White Stone Turnips.

FRUIT GARDEN.

Attend to previous directions in regard to thinning and stopping the young shoots of all trained fruit trees, and now make the final thinning of Peaches and Nectarines, of course leaving the heaviest crop on the most vigorous trees and

strongest branches. As a general rule no two fruit should be left together. Plum of the large kinds, as well as the finer sorts of Peas, should also be thinned if the crop is too heavy. Young Peach and Apricot trees when making over-vigorous leaders should have the points of the branches shortened to encourage them to make other shoots less vigorous, and of a fruitful character, which will obviate the necessity of shortening them back at the winter pruning. Strawberries will require frequent waterings in this dry weather: Place netting over the plants to protect them from birds, and it will also be very beneficial in partially shading the fruit from the midday sun. Layer the runners in 3-inch pots. For this purpose prepare a compost of two parts of friable yellow loam and one part of well-decomposed dung, with the addition of a tenth part of the whole of charred material. Take care that the pots are well drained, and have them placed on a south aspect, and on boards or slates raised a few inches above the surface of the ground, to prevent the worms getting into them. All spare runners may be cut away, and keep the plants free from weeds. Thin and stop shoots of Figs as soon as they have made a growth of about 6 inches; and remove all useless growth from Vines, keep the fruit close to the wall, and shaded by the foliage from the sun.

FLOWER GARDEN.

The Roses are the great attraction here at present, and these should be frequently looked over, removing decaying flowers, &c., which, if allowed to hang on the plants, have a very unsightly appearance. Now is the best season for observing the effect of the arrangement of colours, &c., and if any alteration is deemed necessary it should be carefully noted. This will greatly facilitate its execution at the proper season. Proceed with the propagation of favourite sorts which it may be desirable to increase either by budding or cuttings. The Hybrid Perpetuals, Teas, Chinas, and Bourbons are generally preferred on their own roots, and firm, short-jointed shoots of these root very freely at this season; but to insure success they should be afforded a slight bottom heat, be carefully shaded, and not kept too warm until they emit roots. They will, however, root under a hand-glass on a shady border. Remove suckers from worked plants. Cut-back the shoots of the autumn-flowering varieties to the most promising eye, as soon as all the flowers are expanded and begin to fade. If manure water cannot conveniently be given, stir the surface soil with a fork and apply a good sprinkling of guano, the strength of which will be washed down to the roots, and will serve the same purpose as manure water. Slugs must be sharply looked after, otherwise plants to which they are partial will be very likely to be injured. The propagation of flowers for masses is a most important matter, and much depends on its being performed in due time. If stove plants for the ensuing year are propagated and potted-off too late, they will not be easily preserved during the winter. A bed should be prepared in an open situation where constant attention can be given. The soil should be free and rather sandy, and should be made somewhat fine, as is usual for cuttings, and a canvas screen should be always at hand to ward off continued sunshine. After the bed is made particularly level in order to equalise the moisture by watering or otherwise, a number of striking-glasses should be placed ready to cover the cuttings as they come to hand, for after all it must be progressive work. Choice Verbenas, Calceolarias, Pelargoniums, Petunias, Heliotropes, Fuchsias, Pentstemons, Mule Pinks, Picotees, double Wallflowers, with numerous other mass or border flowers may be successively put in, as cuttings of a proper character can be obtained. They should be slightly watered when put in, and should receive a slight shading in sunshine for the first month, after which they may be gradually inured both to sunshine and air.

GREENHOUSE AND CONSERVATORY.

Follow up shifting with such of the hardwooded tribes as require it. A turfy compost of three parts sandy heath soil of a fibrous and rather lumpy character, and one part sound loam of a similar texture, will suit the majority. The more tender kinds will require lumps of charcoal, stone, or crocks introduced occasionally until near the surface of the pot. Let every attention possible be paid to the most thorough drainage; this cannot be too complete, taking care especially to use very hollow crocks at the bottom, for if these lie too flat and become closed up, it matters little how much depth of drainage material is upon them, all will be stagnation. Some of the stove plants that have recently been brought into the conservatory will require attention to prevent their being injured by damp if cloudy weather should occur, and it will probably be

necessary to use slight fires occasionally for the purpose of drying the atmosphere of the house. The propriety of this will, however, greatly depend upon circumstances, for in small well-ventilated houses damp will hardly be troublesome, whereas in lofty houses with but little ventilation, and the roofs overgrown with climbers, it may be so to a very great extent. But at this season there is nothing to fear from cold, and air should be freely admitted at every favourable opportunity, using every care to keep the atmosphere of the house as dry as possible, and keeping the plants clear of decaying flowers. Considerable care will also be necessary in watering recently repotted specimens, whether of the soft or hard wooded class, as in the case of cloudy weather they will require very little water, and will be speedily injured by a careless supply. Continue to carefully regulate the growth of twiners, but avoid tying them too closely, and allow them to grow according to their natural habits as much as circumstances will permit. Examine the border plants frequently for insects, which, if allowed their own way at this season, soon injure the young tender growth. The *Luculias* are matchless subjects for the conservatory borders and are deserving of every care, but they are very subject to black thrips. Tobacco smoke is the most effectual remedy for this pest.—W. KEANE.

DOINGS OF THE LAST WEEK.

On the evening of this, the 9th inst., we have had thunder, but little rain, though it has fallen heavily in some places in the neighbourhood. In summer, especially, we often notice that the cloud breaks on the height, and sheds its contents in the valleys. In winter, the heights get their share more regularly. However, the showers which we have had, though as yet doing little to fill reservoirs, have refreshed vegetation, and even the lawn, beginning to be brown, is putting on its bright green livery. As a commencement, we are having trough piping placed round our pits, that the water from them, as well as houses, may be conveyed to a clean-water tank. The water from these pits was not lost formerly, as it fell on firm ground, so sloping that the rains ran to cesspools, whence it was conveyed in pipes to a pond concealed from view. We thus from roadways, &c., obtained a quantity of water, but it required to stand some time to become clear. We shall now have more clean water, and will just have so much less in the pond.

Celery.—The cloudy days, helped by occasional drizzles, enabled us to plant out a good deal in beds, generally three rows in a 4-foot bed. As some of our coadjutors say, there is no difficulty in earthing it up by placing light boards between the rows, and moving the boards as the earthing-up proceeds. We have long dispensed with the boards, even when we have had from four to six rows across a bed, and, provided each plant is nicely cleaned at the base, and then loosely tied, the earth can be easily applied without the help of boards. The earth is merely well pulverised and squeezed to the plants a little by the hand. In stiff soils, and where slugs and worms are apt to be troublesome, it is a good plan to have semicircular pieces of old spouting, say 18 inches long, of tin or zinc, made on purpose, two to be placed round and pretty close to each plant, the interior to be filled with ashes, and then the space between with earth, drawing up the pieces of pipe as you go along. This plan is one of the best for preventing slugs and snails marking the *Celery*.

Our *Celery* beds have been filled until now with bedding plants, dwarf Peas, and Potatoes, and now they have had an addition of very rotten dung, made moderately firm before planting. For large *Celery*, rather rank dung may be used. When sweet, crisp *Celery* is desired, all rank dung should be mixed with the soil at the bottom, if used at all, and sweet dung mixed with soil near the surface. On the ridges we have had rows of Peas, but the dry weather has caused some of them to come to maturity earlier than we wished, and as some rows were removed we used branches laid across the bed to give a flickering shade until the air became cooler, and the clouds gave a little more shade. After one good watering at planting, we must be satisfied with a few surface sprinklings. Our plants would not have required the latter if they had been better established with good balls before turning out, as we generally have them; but in the press of matters only part of what is planted received the usual attention, and therefore they feel the moving more at first. Our later crops will be more independent in this respect, and where water is scarce it will ever be easier to water a bed somewhat thickly planted than the same plants spread over a large space. Such plants

forming good balls, with young fibres bristling all round them like a wig, when well watered some hours before lifting, will require comparatively little watering when transferred to sunk beds or trenches.

Cucumbers.—Our earliest, in a pit heated by hot water, have been all that could be desired, but twice they have had a little fly, and what was worse, they were attacked with red spider. The latter was mostly our own fault, as three times successively we put a row of Strawberry plants on a shelf close to the apex, and thus got Strawberries to ripen and colour well some days earlier than we could have ripened them elsewhere. The dryness, so necessary to full flavour, prevented us syringing near the top of the pit—in fact, we could syringe but little, hence the presence of the red spider. These Strawberry pots were taken there merely to hasten the swelling of the fruit, as it was all set and swelling previously. On taking away the Strawberry-shelf we cut off the leaves of the Cucumbers most affected with the spider, and then two or three smokings with tobacco paper and syringings with clear soft-soap water, removed all trace of the insects, and the plants now look as healthy and vigorous as they did at first. We had planted out a few more in case the plants had shown signs of exhaustion.

A few of the details of treatment may be given. The pit is nearly 6 feet wide, with a space shut off inside of about half that width. As we wanted Cucumbers soon after planting out in spring, we considered that width too much. We therefore kept our plants in rather large pots, banked-up all round with sweet hot dung to within an inch of the rims of the pots. When fairly established the bed was surfaced all over so as to be level with, and frequently to cover the rim of the pot, the pot itself being filled with rich compost. Roots now come from the top of the bed and run along the surface of the bed, and a sprinkling of fresh rich compost has been spread over them two or three times. The curbing of the roots by the pots caused the early fruit to swell better, and prevented over-luxuriance, and the pots, though now concealed, do something still to secure fruitfulness and moderate growth in such little space. With elevated span-roofed or lean-to houses with a good length of roof, we should consider such cramping of the roots unnecessary, unless where early results were wanted. We can produce Cucumbers plentifully enough in the usual low pits and frames, but in general, and especially for all large, vigorous-growing kinds, the pit and the frame are poor substitutes for the house with the more elevated roof, and where the most of the work can be done by the operator standing beneath the stems and foliage of the plants. In such circumstances, with even soft-soap water at command, we should give little chance to red spider, thrips, or green fly to do much more than make their appearance.

FRUIT DEPARTMENT.

Here we pass other matters to chronicle a disappointment. A Peach tree on the back wall of our orchard house, beautifully supplied with fruit, and looking pretty well until within a few days, is going to bid us good-bye. Although we knew it had a trial to go through, we did not expect we should lose it. About February or March the stem of the tree had been nibbled all round by mice, every bit of outer and inner bark being removed to the depth, perpendicularly, all round the stem, of from 6 to 7 inches. The alburnum, or last season's layer of wood, was also eaten into in various places, but a good portion seemed to be untouched. We covered over the place with a mixture of clay and cow dung, tying it up securely with a cotton cloth, so as to exclude air, and when examined once or twice we found fresh bark freely forming from the upper and under sides of the large wounded or barked part. As we had often witnessed the heavy crops carried to completion on the branches of fruit trees, where, owing to canker, there were open spaces all round destitute of bark and alburnum, we were in hopes that our tree, and the crop on it for this year, would not have suffered, and more especially as fresh bark was forming on both sides of the wound. We have noticed Plum, Pear, and Apple trees living and fruiting for years with more than double that space of stem destitute of bark. We have been astonished to find, on removing Peach trees becoming exhausted, how very small a space of living wood sufficed to keep up the circulation. We felt annoyed at the mice thus clearing away the bark from the stem of a favourite tree, but after covering the wound over we were in hopes that our tree would eventually suffer no more than it would do from a rather severe ringing. Something there may be in the very nibbling of the mice, as we have often seen hundreds of Laurels die upwards, even though the nibbling did not go

right round the stem. We have not examined nor removed our tree, but we suspect we shall find that the internal wood of the stem is decayed, so that the mice did not leave enough of wood for the sap to pass freely. In other cases we have found that large wounds and openings would be healed over in a year or two, especially when covered up from the sun and air.

ORNAMENTAL DEPARTMENT.

The work was much the same as in the previous week, diversified with much labour in fresh arranging the corridors and conservatory, and in potting plants, pricking off Chinese Primulas, Cinerarias, planting out old Cinerarias to get suckers from them, and sowing the seed of herbaceous and semi-herbaceous Calceolarias blooming for next spring.—R. F.

TRADE CATALOGUE RECEIVED.

James Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, S.W.—*Catalogue of New and Beautiful Plants for 1870.*

TO CORRESPONDENTS.

THE JOURNAL OF HORTICULTURE PRIZE (Competitor).—There is no limit as to the number of dishes of fruit for this prize to be awarded at Oxford on the 19th, and flowers may be used in any way in arranging the dishes artistically.

ELM SEEDS (A. McCallum).—The seeds you enclosed were not of the *Ulmus campestris*, English Elm, but of *U. montana*, the Mountain Elm.

ROYAL BOTANIC SOCIETY'S SHOW.—Messrs. Weeks & Co. inform us that they received a first-class certificate of merit for their patent duplex boiler and conservatory designs. If the Society advertised their awards in our columns as the Royal Horticultural Society does it would be satisfactory to the prizetakers, and omissions would not occur.

FRUITING VINES (Reader).—In reference to the Vines alluded to at page 465, if you resolve to fruit the Vines from the sill up the upright glass, then leaving the newly-turned-out plants 6 feet in length was right enough. This plan may be well followed when the house is devoted to Vines only, but when other plants are grown in the centre of the house the light from the front is too much obstructed. You may, as you propose, try more heat and moisture to get the Vines to grow and break, but in our opinion the coolness of the house was rather in favour of the Vines breaking. After the treatment you have given them we are at a loss to account for the buds not breaking. No doubt the check given to the roots would be considerable, but treated as stated the buds ought to have broken.

VINE SHOOTS DYING AT THE TIP (J. M. Skell).—Your Vine shoots perish through scorching, caused by a too hot dry atmosphere, the roots in the meantime being plentifully supplied with moisture and making succulent shoots. Give more air, and keep a moister atmosphere during the day.

DISEASED SHOOTS AND LEAVES OF VINES AND FUCHSIAS (J. R.).—The shoots and leaves were rather far gone to enable us to judge surely; but they had signs of scalding from hot vapour, if these signs were not the result of sweating in your letter. Besides that there were marks of thrips, and we are almost sure of red spider as well. For the latter, sulphur and syringing with soft-soap water would be the simplest remedies, the sulphur being placed on a hot-water pipe or on the wall where the sun shines. If mixed with soft soap it will adhere tolerably well. The soft-soap water should be applied as stated the other week, clear, and of the strength of 1 lb. of soap to about thirty gallons of water. The thrips is a little narrow insect that jumps as you approach it. The best remedy is smoking with tobacco at night when the leaves are all dry, and syringing the next day with soap water. The only remedy you have—of cutting Fuchsias down and getting them to grow afresh in a mild dung heat—is effectual, because the moist heat is bated by red spider and thrips.

HEATING A SMALL GREENHOUSE (A. Downes).—There is no doubt but you may keep up a temperature of from 50° to 60° in your small glass house heated by gas, hot water, and otherwise; but we are doubtful if you can get all this done, except with the lightest materials, for 45. If you refer to our No. 341, pages 273 and 279, you will find all we can state about gas-heating.

DIRTY RAIN WATER (Item).—It would not hurt the roots of plants unless muddy; but it would be easy to make it clear by passing it through a barrel or reservoir with pebbles at the bottom, and rough clean gravel and charcoal above these. A layer altogether from a foot to 18 inches thick would do if frequently cleaned and replaced. The New River water we should use without hesitation or preparation.

MELONS GOING OFF (G. A. N.).—We see nothing wrong with the bottom heat, nor in the time of admitting air and shutting up, only we should like to give a little air before 8 A.M., and not shut up altogether at 4 P.M. We think the gangrene on the shoots arises from condensation of moisture on the glass, and consequent drip on the stems or principal branches; but we have suffered more from the disease this year than during any one of the past twenty years, and lost whole framefuls of plants. We have reverted to a practice now little in vogue, that of growing the plants from cuttings. We have plants propagated in this way with fruit set and swelling in six weeks, and none of the daunting tendencies of their parents. Fruit 17 inches in circumference is a good size, it will weigh 2 lbs. and more, but we have many larger fruit of the same sort (Beechwood), although there are three and four on each plant—perfect spheres, and netted all over. They will weigh 4 lbs., and are larger than we like, but if they net well we shall not care how large they may be, for with good netting there is favour. It is very unusual for Melon seeds to germinate inside the fruit, and especially before it is ripe.

WATERING POT VINES WITH LIQUID MANURE (Item).—The liquid manure should be continued until the Grapes are fully swelled and properly coloured, and then it is well to give clear water; but no more than sufficient to keep the foliage fresh. Fifteen bunches on a Vine in an 11-inch pot are good, indeed more than can be coloured well; and the size—1 lb. each—is also good, but all depends on how they finish. It is

easy to obtain a quantity of bunches, but quite another matter to have them perfect in size, colour, and flavour.

CLEMATIS TREATMENT IN POTS (Subscriber).—The plants when in pots require to have the necessary potting early in spring, or after they have been pruned; all the soil that comes away freely may be removed, but avoid breaking the roots, though the sides of the ball should be loosened, and do not give a large shift but allow a moderate space between the sides of the pot and the ball. A compost of two parts sandy fibrous loam and one part leaf soil or old cow dung, with free drainage, will grow them. They will not need much water until they are growing freely, then copious supplies will be required, especially when they are in flower. When the growth is complete the plants should be kept rather drier, but not much so until the leaves turn yellow, and then the watering should be reduced to a minimum, only a little water being given occasionally when the plants are at rest to keep the wood from shrivelling. Before they begin to grow, or in December or January, they should be pruned, cutting out the old, long, bare shoots, leaving as many of those of the previous year as possible. The summer pruning is simply a matter of stopping any straggling shoots, and training so as to cover the trellis equally in every part, but not too thickly. They should have a light airy position in a cool house, otherwise their flowering is not satisfactory. The form of trellis is immaterial.

BELADONNA LILY CULTURE (Item).—Pot the bulbs now, or as soon as the foliage decays, in a rather strong yellow loam, providing good drainage, and placing from five to seven bulbs in a 6-inch pot. Set the pots in a saucer filled with sand, which at no time should be allowed to become dry. They may stand constantly on a shelf in a greenhouse. No water will be required until they begin to grow, and then the soil should be kept moist, and when growing freely a good supply of water must be given, continuing it until the growth is complete, lessening it with the decay of the leaves, and leaving it off altogether when that is complete, still keeping the sand moist. Do not repot for the next year at least, but the drainage must be kept clear. In the open ground they require to be planted in front of a greenhouse, or in some other warm aspect. The bulbs should be planted about 3 inches deep, and be mulched every autumn with a layer of partially decayed leaves an inch or two deep, protecting the foliage also in very severe weather with mats.

STRAWBERRIES (W. G.).—It is very difficult to name Strawberries unless one sees them growing, and even then the number of sorts has so much increased that there is much uncertainty about them. No. 1 appears to be Vicomtesse Hericart de Thury; 2, Keen's Seedling; 3, is like Myatt's Eliza, well grown. Your fruit of Dr. Hogg, 3 inches in diameter, are very fine. Mr. Radelyff is also excellent.

CUTTING OFF STRAWBERRY LEAVES (H.).—No practice is worse than cutting off Strawberry leaves after the fruit has been gathered. The leaves have to digest the sap, and help to provide for the next year's producing.

FERTILISING CARNATIONS (Tyrol).—With a pinners pluck out the petals and cut out the stamens of the flower you wish to fertilise; secure the pollen from the flower you wish to fertilise with, apply it to the stigma of the flower from which the stamens have been removed, and enclose the flower in a fine gauze bag. A camel-hair pencil is best for removing the pollen and applying it.

MOVING NEWLY-BUDDING ROSES (J. W. C.).—Roses budded now may safely be moved in November next. With regard to the new Roses of the current year, we have no doubt "D. Deal," will give us some particulars in due course.

WINTERING IRESINE AND CANNAS (Item).—The former is best wintered from cuttings put in early in August in light, sandy, poor soil, and when rooted potted-off singly in small pots, and kept rather dry in a house with a temperature of 50°. If well established in pots before winter, the plants are not difficult to keep, except in a low, moist atmosphere, but they must be kept dry. If the foliage remains fresh they have enough of water, and none should be given as long as it remains so, but it must not be allowed to flag. The cuttings may remain in the pots in which they were struck, and be potted off in spring; the chief thing to guard against is damp. Cannas should be taken up in autumn after the first frost, be placed in pots large enough to hold the roots, and in sandy loam, placing them in an airy greenhouse, and keeping them there until the growth is ripened off; then cut them down and put them in a dry place, from which frost is excluded. No water, except a watering after potting, will be required. Return them to the greenhouse in March, but if they can be placed in a gentle hotbed for two or three weeks, so as to give them a start, all the better.

DIFFERENT ROSES ON THE SAME STOCK (Lang).—If one proves to be a Tea Rose, and the other a Hybrid Perpetual, we fear the latter will be too strong for the former. You can let both grow till you prove the kind, and save whichever you think the more valuable to you. Hybrid Perpetuals will do mixed on the same stock, provided care be taken to choose those of similar vigour of growth. We do not think, however, there is much to commend the practice.

MADAME FROISSART ROSE (A. M. Jackson).—We do not know of any Rose called Madame Froissart, neither is there, we believe, a Madame Andre Leroy, a distinct Rose from Andre Leroy, generally called Andre Leroy d'Angers.

CLIMBING ROSES (W. R. J.).—Nearly all the most rapid climbing Roses, as the Ayrshire and Multiflora Roses, &c., are white or bluish. The old Boursault Amadis will, perhaps, cover a wall with red Roses more quickly than any other; but we should not plant Amadis only, but Gloire de Dijon, which is the finest of all climbing Roses. Climbing Devoniansis, and Celine Forestier, likewise General Jacqueminot, and Madame Charles Crapet, which, though they will not grow as high as the last three named, will fill up the lower part of the wall for 7 or 8 feet, allowing Gloire de Dijon and Climbing Devoniansis to cover the upper part, which can be done by judicious training. If the soil is light and dry, put plenty of good farmyard manure and cow dung in the border previous to planting.

ERRATUM.—In my last paper on new Roses, near the bottom of the first column of page 7, "Dear to us by Francois Lacharme," ought to have been by "Charles Lefebvre."—D. Deal.

ENGLISH ELM IN SCOTLAND—ALTERING A TREE'S HABIT (A Subscriber).—The English Elm (*Ulmus campestris*), will grow near Aberdeen. We do not know in what way you will induce trees naturally of weeping habit

to grow upright, but you may make those which are stunted grow more freely by cutting off the strongest of the side branches, thus throwing the main support into the upright-growing shoots. This should be done in winter when the trees are leafless, and if persisted in a few years will give you a greater height of tree, and, of course, length of stem.

GRAPES SPOTTED (*A. M. Callum*).—The "black spot that appears on the side of the berries and causes an indentation," is the spot. It is mostly attributable to a deficiency of foliage, and neglecting to give a proper amount of air, also by the roots being in a cold wet border. There is little doubt of the scorched appearance of the foliage, which is arrested by sulphur, arising from mildew, but we cannot say conclusively without seeing a specimen. It is most likely the small white insect of the same size and appearance as thrips, but in a young state. The white or young thrips do not jump about, but the mature insect does so freely. It may be you have the white aphid, which is the most difficult of all to exterminate. Thrips varies considerably on different subjects.

VINE LEAVES—AERIAL ROOTS (*W. T.*).—Do not remove the leaves; they are absolutely necessary to secure size, colour, and flavour to the Grapes. Aerial roots are not injurious to the Vines, but are evidence that they are vigorous. The roots may be removed and will not appear again so soon, as you can have the air of the viney drier when the Grapes are ripening.

OPENING GARDENS TO THE PUBLIC (*J. Wise*).—You are altogether wrong, and your letter must not be published.

PLANTING STRAWBERRIES (*J. Walker*).—Your old pasture trenched 2 feet deep, and a liberal quantity of manure worked in, ought to grow Strawberries well. Being a very strong clay, the addition of road scrapings will be beneficial. Five varieties for succession—Sir Joseph Paxton, Keens' Seedling, Rivers's Eliza, Dr. Hogg, and Frogmore Late Pine.

MUSHROOMS DECAYING AND MAGGOTTY (*F. K. Betheforth*).—We could make nothing of the Mushroom sent, as it was altogether rotten—top and stalk. As you say that the small ones are the same when they appear through the ground, we come to one of two conclusions: either the surface soil is too light for summer, or the place where the Mushrooms grow is too hot for them. We used to have some trouble with Mushrooms in July and August when we depended upon a lean-to house facing the north. With all our care they would be maggoty there and poor at times. This led us to growing them in summer in an open shed—that is, with a wall to the east, open to the west, and a thatched roof, and shaded by trees. Singularly enough we did not commence so soon as usual this year in the shed, and though we suffered a little from ricketty platforms that gave way in the house referred to, the last piece in the house has yielded fine Mushrooms up to the present time, notwithstanding the heat, and is doing so still. Our last piece in the open shed of last year, some 15 inches deep, has also borne profusely. After being dry and pretty well exposed from November last year, we thought it too good to be dug out in the beginning of April. We gave it a good manure watering, and covered it with litter, and to-day has the bed rewarded us. We think most failures are owing to mistaken kindness. In a house, at this season we should damp walls, paths, &c. to promote coolness. In a shed, or in the open air, we should cover, and do cover, for the same purpose—to keep the beds cool. The best Mushrooms are produced at a temperature rather under than above 60°; hence sheds, cellars, and cool places are better than common houses in summer. After all, Mushrooms are often a fickle crop. For many years we have not known what it is to have a failure, and yet it is possible we may soon have an unproductive bed, and scarcely be able to assign the reason why. We have entered into details several times, telling how to vary the treatment according to the material. As to the material, we are not at all particular, provided we can get a few horse droppings for the purpose. If you told us exactly how you managed your bed, we might be able to find out where the error is. Meanwhile, we attribute the "going off" to too close and too warm an atmosphere.

ARTILLERY PLANT (*J. E. B.*).—The botanical name is *Pilea muscosa* formerly it was called *Urtica microphylla*, but never *Thelygonum cyanocrambe*, which is quite a different plant, though belonging to the same natural order.

WEEK'S ONE-BOILER SYSTEM (*Clericus*).—The best example we know is at Manley Hall, near Manchester. If you write to Messrs. Weeks, King's Road, Chelsea, they would send you a drawing of what they have done at Manley Hall. There are three boilers, and these heat houses of all kinds requiring 14,447 feet of piping.

POTATOES ONION-FLAVOURED (*Cornwall*).—The flavour could not arise from the sets being stored with Onions, nor from being grown in a soil where Onions were the preceding crop. The saucepan or the water, or some contact after boiling, we think, must originate the disagreeable flavour.

EARNINGS (*A. S. L. M.*).—We do not know of any better traps than pots stuffed with moss. They may be poisoned, but care must be taken to keep the baits from other animals. Equal proportions of honey and arsenic will destroy all that partake of it.

BRIGHT (*Liphis*).—When the composition is ready for the public and advertised, will be the first time to publish testimonials in its favour.

GLOWWORMS (*Poplar*).—The glowworm is the fully developed, although wingless, female of a species of beetle of which the male is winged. Insects when arrived at the fully-developed state only live till they have paired, and the females deposited their eggs. Hence the chances are very slight that you could keep glowworms on a lawn for more than a short time, certainly not during the winter. They feed both in the larva and full-grown state upon snails and other soft-bodied creatures.—I. O. W.

INSECTS (*G. J.*).—There was not any leaf in your letter when it reached us. Send again. (*H. D. B.*)—The insect injuring your Vines is *Cucurlio picipes*, the chry-coloured weevil. The only remedy is to go at night with a light, hold a sieve beneath each branch with one hand, and shake the branch gently with the other hand; the weevils that may be on the branch immediately drop.

POULTRY, BEE, AND PIGEON CHRONICLE.

RATIONAL POULTRY-KEEPING.—No. 5.

There are few places that are not within reach of a market town, and in all markets there is a sale for poultry. Where

no sale exists, either it has been given up because it was seldom any poultry was to be had, and more frequently still, because when bought the chickens (?) were so hard they were unactable. The first reason is unavoidable, because at some seasons of the year there is little spare poultry, but the second is the result of such false calculation and management that it savours of folly. It was pardonable only in the days when the cost of carriage by stage coach was so great that it did not pay to send a couple or two of chickens, and the time consumed in the journey made the wagon more than useless, and when there were no men who made it a business to collect fowls, or where a sale could be had for one or two couples weekly and no more. They were then killed as they were wanted, and if the stock was large, by the time the last were sent to market they had attained an age that rather fitted them for continuing their breed than for supplying food in their own persons. Now, however, it is different. In almost every village in England, if near a railway station, there is a man who makes it his business to collect poultry of all kinds, eggs, butter, &c., to send either to some county capital or to the metropolis. He will buy the surplus stock, and, mind, it is more valuable to him and more profitable to you if it is young.

But we may be met with the answer, "We do not live near a town. There is no man who collects. We have no means of selling. We will not be bothered with fattening in any shape. We do not know what to do with them. Drot the fowls, we wish we had never seen them." He has a bad counsellor who listens to his anger, and many a possessor of good birds has had his momentary fit taken advantage of, and has sold for a trifle a lot of birds that in cooler moments he would, but for shame's sake, have bought back at a large increase. These fits of anger with the birds are generally caused by an unusually heavy bill for food, or a demand for an increased quantity, or a complaint of the damage they do in the garden, or a fit of the "blues."

Now, it is undeniably true that the fewer fowls you have on the ground the better they will thrive. The best will make a good return for all your food and painstaking, the family can make no other return than to appear on your table, and that is where all this verbiage is to lead us. It is in every way a saving to kill them young, and we will admit they are too small either to roast or boil—as cook says, "Lor, there ain't nothin on 'em, what will they be when they're roasted?" True, good cook; but if you had been a Sussex woman you would have said, "Two of them would make a beautiful pudding."

Say you have some chickens so faulty that there is no hope of their getting right, so ugly they will never be pretty, so crooked they will never be straight. You have so many you look on them every day with an evil eye; and when your man tells you the fox visited Dame Partlett's brood last night, you say in your bitterness you wish he would visit yours. Take some, according to the size of the pudding you require, of the least promising or most offending of your chickens, put them away to fast during six or seven hours, kill them, have them picked quite clean, hang them in a cool larder for a day and night, and then proceed to cut them up, but do it properly. We have heard the cut of a coat criticised by its being said it looked as though it was chopped out with a spade, and we have seen chickens cut up as though the operation had been performed with a hatchet. First take out the crop, then take out all the inside; cut off the feet, and put them in nearly boiling water—all the skin will then easily peel off; put them, the neck, the gizzard (having first taken out the inside), the liver, and heart, in a small quantity of water, and let them boil for gravy. Put the chicken on a table on its back with the crop towards you; take a sharp knife, and cut from the point of the breastbone to the wing, being careful to keep the edge of the knife against the bone all the time, that no meat may remain on the carcase; raise the meat that is divided, and remove it wherever it adheres to the bone. This gives you a delicious wing. One of these will come from each side of the breastbone, and will leave it denuded of meat. These are the two choicest pieces. Next remove the two legs and divide each at the joint, making thigh and drumstick of each; then the wings, cut them off, and divide at the principal joint. You will then have a small merrythought and two small side bones. Lay the carcase on its side, and chop it in half lengthwise. If you have followed our instructions closely there will be little or nothing left on the breastbone; nevertheless, put it in the saucepan that is already turning water into gravy. Then divide the backbone just below the oyster-pieces, and flatten them with a good blow of the flat side of the chopper.

Thus from each chicken you have two slices of breast, two thighs, two drumsticks, a merrythought, two side bones, the wings, and two succulent pieces of back. Next take three or four thin slices of salted pork and put with them. It is a wonderful improvement to cut up two sheep's kidneys and add to it. Luxurious people put ham instead of pork, and some "go the whole hog" by adding mushroom and a few oysters. As we are not writing for them, we will return to our plain dissected chicken and our slices of pork. Season them to your taste. Then make a nice suet crust. Take a basin according to the size you desire, line it well with the crust, and then dispose your pieces artistically as though you were making mosaic work—do not throw them in. Pour in your gravy, tie the basin with a cloth, and boil long and gently. If our description is correct, and you like it as well as we do, your chickens will be benefactors instead of plagues, and you will often ask yourself whether they are large enough for a chicken pudding.

DAMAGING FOWLS AT SHOWS.

Last year I exhibited at Spalding a very good pen of Duckwings; they having during the few previous months won cups at Bristol, King's Lynn, Hull, Beverley, and Thorne, besides first prizes at Leeds, Utverston, &c. Thorne Show took place just a week before Spalding, and this pen had only been left about a quarter of an hour, during which time one of the cock's sickles was broken. Happening to arrive at Thorne just before the Game classes were judged, I took the bird out of the pen, and arranged the broken feather so that it kept its place during the Show, and the pen won the cup. Feeling convinced that the feather had been wilfully broken, I wrote to the Secretary of the Spalding Show explaining the matter, and asked him as a favour to let special attention be paid to this pen, yet this did not prevent the cock coming back with the other sickle broken. As it was, the birds were first in their own class, and had they not met with foul play would most probably have won the cup for the best pen of Game fowls in the Show.

I have been an exhibitor of Game fowls for upwards of a dozen years, during which time I have had several Game cocks returned with the sickles broken or out entirely, and this never happened to any but my very best fowls, proving to my mind that the majority of these cases are the work of unprincipled exhibitors, who take advantage of any chance to get rid of a troublesome pen.—H. M. JULIAN, Hull.

DRIGHLINGTON AND ADWALTON POULTRY SHOW.

The annual Show of the Drighlington and Adwalton Agricultural Society took place on the 9th inst., and the weather being very fine the visitors were numerous. In the poultry department the numbers were not large, in consequence of so many shows having been held during the few preceding days, and the fact that a similar show was held simultaneously about two miles off.

Spanish were first on the list, but these, the *Dockings*, and the *Cochins*, were but moderate in quality. The only pen of *Brahmas* was very good, and of Red *Game* the birds were excellent and close-feathered. The first-prize winners were Brown Reds, and the cup for the best pen was awarded to these. The second prize went to Black Reds. All the *Hamburghs* were good, but the Black were especially noteworthy. The *Creve-Coeurs* in the *French* classes were of extraordinary merit. The cup for the best pen except *Game* was won with *Polands* of the Golden variety. For single cocks *Game* was first, a *Poland* second, and a *Cochin* third. Of *Game Bantams*, a pretty pen of *Duckwings* was first, and Brown Reds of capital style and colour were second. *Ducks* and *Geese* were large and good in all points.

The *Pigeons* were more numerous than the poultry, and the birds shown were of high merit. In *Carrers*, Mr. Horner won with 2 good pair of Black, closely pressed by a neat pair from Mr. Yardley. In the class for *Pouters*, Red were first and Blue second. *Almond Tumblers* were well shown, and the competition close. The Black *Barbs* in the first-prize pen were extraordinary birds, especially the cock, which is about the best we have seen. *Antwerps* were in large numbers, and good in head, beak, and feather. In the *Tarbit* class Blue were first and Red second, and the winning Red *Jacobins* were good in all points. The *Trumpeters* were fine, well-feathered birds, and good in rose and size.

SPANISH.—1, H. Beldon, Goitstock, Bingley. 2, W. Schofield, Gildersome. DORINGS.—1, H. Beldon. COCHINS.—1, J. White, Whiteley, Netherpton. 2, C. Sidgwick, Keighley. BRAHMA POOTRA.—1, H. Beldon. GAME.—Black-brasted or other Red.—Cup and 1, H. Bealand, Westgate Hill. 2, T. Broomley, Shelf. *hc*, H. Walker, Drub, Gomersal; J. Fell, Adwalton. *Duck-winged or other Grey or Blue*.—1, J. Fell. *Any other Variety*.—1, E. Walker, Gomersal. 2, J. Clayton, Gomersal. HAMBURGERS.—Golden-spangled.—1, H. Beldon. Silver-spangled.—1, H. Beldon. Golden-pencilled.—1, A. Smith, Northowram. 2, H. Beldon. Silver-pencilled.—1, H. Beldon. Black.—1 and 2, H. W. Illingworth, Idle. *hc*, H. Beldon; C. Sidgwick. FRENCH.—1, H. Beldon.

ANY OTHER VARIETY.—Cup and 1, H. Beldon. 2, J. S. Snowdon, Adwalton. *Cock*.—1, W. Fell. 2, H. Beldon. 3, C. Sidgwick. *hc*, H. Bealand, BASTAM.—*Game*.—1, W. F. Entwisle, Cleckheaton. 2, W. Greaves, Bradford. *hc*, W. F. Entwisle; J. Walker, Adwalton. *Any other Variety*.—1, H. Beldon. 2, T. E. Harrison, Hull. *GESE* (any breed).—1, J. White, Netherpton. 2, J. Ward, Drighlington. *Ducks*.—Aylesbury.—2, T. Wilson, Crosshill. *Eggs*.—1, J. White, 2, C. Sidgwick.

PIGEONS.

CARRIERS.—1, E. Horner, Harewood. 2, H. Yardley, Birmingham. *hc*, J. Hawley, Bingley; E. Horner, POTTERS.—1, J. Hawley. 2, E. Horner. *hc*, H. Yardley. *TUMBLERS*.—*Almond*.—1, E. Horner. 2, H. Yardley. *Any other Variety*.—1, H. Yardley. 2, J. Hawley. *BARBS*.—1 and *hc*, E. Horner. 2, H. Yardley. *ANTWERPS*.—1, J. Crossland, Wakefield. 2, E. Horner. *Extra* 2, J. Hawley. *hc*, H. Yardley; J. Crossland (2). *TURBITS*.—1, H. Yardley. 2, T. Holliday, Idle. *hc*, E. Horner (2). *FANTAILS*.—1, H. Yardley. 2, E. Horner. *hc*, J. Hawley; E. Horner. *JACOBSINS*.—1 and 2, E. Horner. *hc*, H. Yardley. *TRUMPETERS*.—1, E. Horner. 2, J. Hawley. *hc*, J. Hawley; W. Tetley, Birkenshaw. *MAGPIES*.—1, E. Horner. 2, H. Yardley. *hc*, T. Halliday. *ANY OTHER VARIETY*.—1, H. Yardley. 2, E. Horner. *hc*, J. Hawley. *MEDAL* for greatest number of points in Pigeon classes, E. Horner.

The Judge was Mr. E. Hutton, Pudsey, Leeds.

SNAITH POULTRY SHOW.

The sixteenth annual Show of the Snaith Agricultural Society took place in the grounds of Mrs. Shearburn on the 5th inst. This park is well studded with trees, and the pens were well sheltered from the sun, which was a great boon, as the day was excessively hot.

The *Game* in the class for Reds was very good, and the competition keen. The second-prize pen was only so placed through the cock being slightly crooked in the breast. In the class for any other variety of *Game* Mr. Sales showed a first-rate *Pile* cock. The *Spanish* class contained some of the best birds in the country, and the timepiece awarded to the best pen in the Show was won by birds of this variety. The *Cochins* belonging to Mr. W. A. Taylor were Partridges of high quality. The winning *Hamburghs* were good in all classes. Of *Game Bantams*, a handsome pair of Black-breasted Reds were first; the second and third-prize birds were also good in style, but in bad condition. For *Bantams* of any other variety Blacks were first, Japanese second, and *Schrights* third. *Creve-Coeurs* were first in the "Variety" class, *Polands* second, and *Dorkings* third. Mr. Brierley was first in the single-cock class with a splendid Black-breasted Red *Game*, which was one of the best birds we have seen for some time.

Of *Pigeons*, the winning *Jacobins* were good in hood and chain, and the *Fantails* were also in good order. There was, in addition, a good but small show of cage birds.

GAME.—Black or other Red.—1, E. Ackroyd, Eedeshill. 2 and *hc*, F. Sales, Crowle. 3, J. Brierley, Middleton. *Any other Variety*.—1, F. Sales. 2, J. Stabler, Driffield. 3, C. Brierley. *hc*, E. Ackroyd. SNAITH.—Black—Time piece and 1, H. Beldon, Bingley. 2, Rev. J. Price, Haddisley. 3, T. O. Newbitt, Epworth. *Cochin-China*.—1, W. A. Taylor, Manchester. 2, J. Brierley. 3, J. Wakefield. *hc*, J. Torton, Ackworth. *HAMBURGERS*.—Golden-spangled.—1, H. Beldon. 2, G. Holmes, Driffield. Silver-spangled.—1, H. Beldon. Golden-pencilled.—1, H. Beldon. 2, G. Holmes. 3, D. White. Silver-pencilled.—1, H. Beldon. 2, W. A. Taylor. 3, T. Dawson. BANTAMS.—*Game*.—1, J. Oldroyd, Wakefield. 2 and 3, J. E. Robinson. *Any other Variety*.—1, T. C. Newbitt. 2, H. Beldon. 3, T. C. Harrison, Hull. *ANY OTHER VARIETY*.—1 and 2, H. Beldon. 3, W. Purdon, Driffield. *hc*, H. Beldon; W. D. White, Driffield. *Cock*.—1, C. Brierley. 2, W. A. Taylor. 3, H. Beldon. *Ducks*.—1, Wakefield. 2, T. C. Harrison. *GESE* FOWLS.—1, T. C. Harrison. 2, Mrs. W. Broadley. 3, O. A. Young, Driffield.

PIGEONS.

TUMBLERS.—3, R. Simpson, Selby. *JACOBSINS*.—1, W. White. 2 and *hc*, T. C. Newbitt. *TERTS*.—1, T. C. Newbitt. 2, E. Bairdson. *FANTAILS*.—1, T. C. Newbitt. 2, E. Harrison. *EGGS*.—1, S. Robinson. *ANY VARIETY*.—1 and 2, S. Robinson. *Extra* 2, T. C. Newbitt.

CANARY.—1, T. W. Dickinson, Doncaster. 2, A. J. Wells, Hatfield. *hc*, T. Fosbrooke; A. J. Wells (2). *ANY OTHER VARIETY OF BIRD*.—1, G. Trimmingham. 2, F. Higgins.

The Judge was Mr. E. Hutton, Pudsey, Leeds.

BOSTON POULTRY SHOW.

The first Show of this kind held at Boston took place on the 5th inst., and as regards the number of entries and the attendance of visitors, it was a great success. Being a first attempt, the arrangements were scarcely so perfect as in all probability the experience now obtained will make those of future years.

Of *Dockings*, the majority were, unfortunately, much deformed in the feet, though otherwise excellent birds. *Cochins*, though not numerous, were good. *Spanish*, though first-rate, were mostly very deficient in condition. The Dark *Brahmas* were an excellent class, and as regards *Game* fowls, it is very unusual to meet with such excellent classes, the birds shown by Mr. C. Chaloner in the various *Game* classes being such as to excite the admiration of all who saw them; these, together with the prize *Game Bantams*, were shown in the most perfect condition possible. *Hamburghs* were throughout well shown, but the season now tells much against the beauty of the adult birds, and the whole of their plumage is fast becoming faded and shabby, their annual molting time being at hand. The *Water Fowls* were decidedly good, and the show of *Pigeons* was such as might be envied by the managers of much larger and long-established shows. There was also a very interesting and popular display of *Parrots*, *Canaries*, fancy song birds, both English and Foreign, and *Rabbits*. The poultry were exhibited in the well-known pens of Mr. Turner, of Sheffield.

DORINGS.—1, J. Watts, King's Heath, Birmingham. 2, G. Andrews, Tuxford. 3, R. Wood, Clayton, near Thrapstone. COCHIN-CHINA.—Cinnamon and Buff.—1 and *Cap*, J. Cattell, Birmingham. 2, W. Gamon, Chester. *hc*, W. Harvey, Sheffield. 3, Rev. J. Spencer, Atterborough. *Any other Variety*.—1, H. H. Bleis-

toe, Barnwell, Oundle. 2, Mrs. E. Barker, Leverton. **BRANMAS.**—*Dark.*—1, C. Chaloner, Whitwell, Chesterfield. 2, J. H. Dawes, Birmingham. *hc, J. Waite, King's Heath, Birmingham; W. Gamon, Spanish.*—1 and Medal, T. & C. Newbitt, Epworth. 2, J. Dixon, Cotgrave, Nottingham. **GAME.**—*Black-breasted Red.*—1 and Cup, C. Chaloner. 2.—Hales, Crowle. *hc, J. RABBITS.

ANY PURE BREED.—1, E. Vaughan, Birmingham. 2, J. Quick, St. John's Wood, London. *hc, H. G. Tunison, Barton-on-Umber; J. Quick, c. W. Tiffery, Long Sutton; S. G. Hudson, Hull. HEAVIEST.*—1, Master Arkwright. 2, J. Quick. *c, W. Taylor, Boston.*

Mr. Edward Hewitt, of Birmingham, was the Judge for *Poultry*, and Mr. Massey, of Spalding, for *Pigeons and Rabbits*.

CAMBRIDGESHIRE AND ISLE OF ELY AGRICULTURAL SOCIETY'S POULTRY SHOW.

This Society has now for a long succession of years added poultry to the varied objects of the annual Show, and experience proves that the display of poultry and Pigeons is perhaps one of the most attractive parts to the public generally. It is also now well known that the valuable specimens entrusted to the care of the Committee are treated with the greatest attention, and from this cause only few shows enjoy a larger amount of support. Grey *Dorkings* at the Show held at Royston on the 6th inst. were very good, the chickens more especially so, several pens of the latter being unusually well-grown for the present season. It is well to mention as a guide to intending exhibitors, that such malformations as gouty feet, deformed legs, or spurs set on the outside of the legs, are to be especially avoided as fatal objections in the choice of pens of Dorking chickens for exhibition. Singularly enough not a pen of White *Dorkings* was shown. As most poultry fanciers would anticipate, the collection of *Game* fowls was good, Messrs. Matthew and Hall being close competitors. The display of *French* fowls was far better than ordinary, though many of the best specimens were fast falling into deep moult. *Of Cochins and Brahmas* the classes were good, but the birds not in the best of plumage. The *Hamburghs and Poland*, for the neighbourhood, were better than usual. Still more worthy of mention were the *Game Bantams*; here Mr. Jeffries, of Ipswich, with two pens of his best birds secured both prizes. The class open to chickens of all breeds except *Dorkings* was a most interesting feature of this Show, and augurs well for a speedy entry at most of our coming meetings of a display of well-grown birds of the current year. *Turkeys and Ducks* were unmistakably excellent, and many of our agricultural friends appeared quite astonished at the size and perfection of the majority of the pens that were comprised in these classes. The entry of *Ornamental Water Fowls* was also remarkably good.

Pigeons formed an interesting portion of the display, and Mr. Fulton, of Deptford, though the chief prizetaker, with birds so well known, had a very close competition with other exhibitors in many of the classes.

The shedding in which the Show was held was excellent; and that such was provided, as it always is, was fortunate, as an extraordinarily heavy rain fell throughout the night preceding the Show, although the day of opening was as fine as could be wished, the result being an attendance of visitors almost unprecedented at any previous meeting of this Society.

Edward Hewitt, Esq., of Sparkbrook, Birmingham, officiated as Judge.

MOULTON POULTRY SHOW.

This Show was held on the 6th inst., in the beautiful grounds of H. J. Little, Esq., The Thorpe-lands. The first-prize *Dorkings*, also the *hc Spanish, Brahmas*, and *Game* were very good, and would not have disgraced any Show. Among the *Pigeons* were some passable birds.

DORKINGS.—1 and 2, J. Longland, Grendon. **SPANISH.**—1 and Cup for best pen in Show, H. M. Cooper, Walsall. 2, C. Wright, Northampton. **GAME.**—1 and 2, B. Cox, Moulton. **COCHINS.**—1, J. H. Dawes, Moseley Hall, Birmingham. 2, W. F. Checkley, Moulton. **BRAHMA.**—1, G. F. Whitehouse, Birmingham. 2, W. Birch, Barnack, Coventry. **HAMBURGHS.**—1, W. Nottage, Northampton. 2, B. Cox. *hc, E. Mr. H. Yardley, Market Hall, Birmingham, was the Judge.

BISHOP AUCKLAND POULTRY SHOW.

The second annual Show took place on the 8th inst. Turner's pens were used, and were arranged in single tiers round the sides and through the middle of the marquee in which the Show was held. The arrangements were excellent, and great credit is due to the Committee. One gold cup, one silver cup, and two handsome gold medals, in addition to money prizes, were given, and the entries were numerous, while the quality of the birds was excellent in most of the classes.

Dorkings were in no respect noteworthy, but the *Cochins* very fine. The pen of White shown by Mr. Proctor was quite perfect, if we except the comb of the cock, which is rather plain. Of *Brahma Pootras* there were some fine specimens, a cock shown by Mr. Stalker being of striking size, shape, and colour. *Spanish* were as good as could be desired, and the first-prize pen in this class won the gold cup for the best pen in the Show, and was claimed at £20 immediately on the opening of the Show to the visitors. *Polands* were a very good class, perhaps one of the best we ever saw considering the time of year. In the class for *Game*, Brown Reds were first and Black Reds second. The *Duckings* in the class for any variety of *Game* were wanting in condition and feather, and with the exception of the winner in the single *Game* cock class there was no bird worthy of notice. There were several good pens of *Hamburghs* in bad order, and not at all fit for exhibition, though those noticed in the prize list were in nice bloom and well shown. In the "Variety" class the first were *Cerve-Cerve*s of extraordinary proportions, and the second a fine pen of that almost extinct variety the *Malays*. The *Game Bantams* showed signs of moulting, and, as a whole, they were not a good lot, though the pair to which the first prize was awarded, also the local medal, were good Brown Reds. A neat pair of Blacks were first in the next class for Bantams, closely pressed by another pen of the same variety. For *Ducks* the Rev. J. Milner was first and second with good birds, and the single *Turkey* cocks were of large size and handsome colour. Brahmas were first in the selling class, Buff Cochins chickens second, and *Duckwing* Game third.

The show of *Pigeons* was a complete success, and the classes well filled with good birds. Of Carriers the first-prize birds were in fine order, good in style, beak, and eye, though perhaps not so long in beak as the second-prize birds, which, though young, were very large and long in beak. Pouters were good, especially the first-prize Whites, which were in fine showing order, of great size, and good in style and girth. Tumblers were shown in one class, and were mostly Almonds. The cock in the first-prize pen has an extraordinary skull, and the hen is also good. The second-prize birds are exceedingly small and

well broken in feather. The Barbs were good and in fine condition, but we did not consider the Owls good. Trumpeters were as good as we could wish for, although some were partly broken in feet feathers. The silver cup for the best pen in the Show was given to the first-prize pair in this class. These were Light Mottles, and, though rather smaller than some of the rest, they were very good in rose and leg-feathering. Fantails were rather broken in feather, but good in carriage. The winning Jacobins were Whites and Reds of good properties, and the local medal for the best Pigeons was awarded to the former pair. In the "Variety class" Red Magpies were first, Blue Brunswicks second, and Black Swallows third.

DORKINGS.—1, J. White, Warlawy. 2, W. Bearpark, Ainderby Steeple, North-allerton. *hc.* J. Shorthose, Newcastle-on-Tyne. **COCHINS.**—1 and 2, G. H. Proctor, Durham. *hc.* J. Shorthose. *c.* W. RABBITS AND THEIR VARIETIES.

SINCE my removal from Prestwich my time has been so very fully occupied and so much of it spent from home, that our "furry friends" have not had the attention devoted to them I could have wished; but now I hope to see more of them, and shall be able to say a word or two on their behalf when required and opportunity presents. And the fact of my ceasing to exhibit, as for the past three or four years so successfully, must not be considered by my fellow exhibitors as a proof that I lack the interest I once had in this portion of our great shows, for I still keep up the excellent prize-winning stock in every variety as before. I have now eighty specimens of all ages in my rabbitry, and I always anxiously look over the returns of the prize-winners as given in "our Journal" (and I regret they are not more detailed) to see who is the fortunate owner of the specimen so perfect as to secure the high honour awarded by the judge in attendance.

SILVER-GREY OR CHINCHILLA.

Respecting this lively creature much may be said in its favour, its glossy silky hair being so prized by the furrier. In Siam (Indo-China) this animal is found in the greatest numbers and state of perfection. A variety of shades are now found in this country as the result of our colder temperature, and the experiments of re-crossing with darker or almost black specimens; and I know of few, if any, kinds where a greater variety of shade may be produced. I have long experimented in producing this variety, and have arrived at the conclusion that the more silver-like the specimen is marked all over, the more perfect. Black feet, ears, and faces generally are objectionable, and as a hint to all breeders, I would say, Pair two that are perfectly silvered all over, and you need not fear the result.

This animal is not generally large; if of the true kind it is

about the weight of the Himalayan. A strong large animal called the "Lincolnshire Silver-Grey," or "Miller" by the furriers, with only a small sprinkling of the silvery hair, and at times also designated the "Silver Sprig," may be seen, and I have known them weigh 10 lbs. or more, but they are very dark in shade compared to the Chinchilla, which the real Silver-Grey Rabbit resembles, hence the term as applied to this mercurial little fellow. Of all the cute (to borrow a term from our transatlantic friends) creatures of the Rabbit family this is one, and generally not so docile nor so easy to tame as other varieties, as the Dutch or Angora, which if treated kindly are always ready to be petted. Yet with kindness it is wonderful what may be done, and the law of kindness should be strictly enforced in every rabbitry if your stock is to afford pleasure.

I think the active manner and cheerful temperament of this Rabbit always render it a favourite. All breeders know the young are born quite black, and when about six weeks old they present a greyish shade under the body, and this change extends over from five to seven months, according to the temperature of the hutch; if warm, the process of silvering is sooner completed, the ears, neck, and head generally retaining the black shade longest. I have noticed the more jet black the young are at a month old, the more perfectly silvered they become at say eight months, so that I would not have young fanciers be afraid lest the jet black appearance be too great, and to lose hopes of the true silver shade appearing, but, in the words of a once popular song, I would say, "wait a little longer."

Warmth for all hutch Rabbits is of great importance, and this variety is by no means an exception, yet a hardy Rabbit generally, and with the requisite care by no means difficult to rear with success. I have generally had from fifty to seventy of this variety alone born in my rabbitry every year, and I suppose that during the last three years and a half from eleven to twelve hundred have been born of the seven varieties I keep.

The doe is rather shy, especially when about to have young, and seems very much afraid, when the nest is made, that it may be interfered with. She watches with an anxious eye every motion of the hand when placed inside the hutch, to see if her private domain is to be intruded upon, and I have known any such intrusion punished by the total neglect of the litter. The does seem to prefer, when about to litter, a rather dark but clean corner of the hutch, and should have plenty of fresh hay and water, or if milk and bread all the better to quench the intense thirst experienced at that time. In fact, milk and bread are no objectionable breakfast at all times for the first two or three weeks, if to be had. The Belgian Hare Rabbit is rather an exception to some of the other varieties, especially the one in question, for I have known does make their nests quite opposite the wire door, as though not in the least ashamed for the lookers-on to see what a important event has happened since the last visit.

The Silver-Grey doe generally brings forth from five to eight at each litter, but should not be allowed to pair until nine months old at the earliest, if fine and strong specimens are required for exhibition, and the litters should be at intervals of not less than ten or twelve weeks, to keep up the strength of the doe.

I have always, when opportunity presented, tried to obtain all the information possible from "fanciers" (breeders I mean), and have taken a peep on all occasions at the specimens of my prize-winning friends in all parts of the country. I am always glad to see any one here to look over my stock, and I hope, ever ready to give any information or useful hint to insure their success as breeders of the various varieties of fancy Rabbits.

In conclusion I beg to thank all those numerous friends from whom I have received so many letters in reference to my previous remarks on the other varieties, and I can only say that the information I may possess as a breeder of every known variety of Rabbit is quite at the service of any correspondent who will take the trouble to write to me.—CHARLES RAYSON, Ivy Lodge, Didsbury, near Manchester.

VEGETABLES BETTER THAN NOTHING.

As this touches a point I have long felt interesting, I venture to trouble you upon the subject, as, if an improved diet could be introduced, it would prove a comfort to many. Foreign workpeople have told me they found it impossible to keep strong here with the same mode of living as they followed in their own country; but soups made from vegetables, the water in which meat has been boiled, with pieces of bread added, would provide an occasional wholesome meal. But this wants slow

and careful cooking, and working people cannot spare time for this, and our open stoves make firing expensive. One plan would be to add a kitchen to the national schools, teach the children cheap cookery, and make it self-supporting by selling. Food well cooked would add to the comfort of a poor man's home, and save him from other temptations.—E. M. MAJOR.

NADIRING—HEATH PASTURAGE.

I HAVE placed several hives filled with comb, or empty, below other strong stocks; in these the bees work well, but as the upper hives only receive air through some twenty inch-holes, is there not fear of dysentery? My hope is to obtain artificial swarms in the lower hives to supply great losses caused by the late disastrous winter.

A few miles distant we have large heaths of ling; if I carry weak swarms to it when in bloom, can you tell me how much assistance I may expect them to obtain from it? Will it be such a second honey harvest as to enable a swarm, driven into a hive with comb, to get honey enough for the winter? Will it also encourage the queen to increase the laying of eggs? Can you tell me how long ling generally remains in flower? also, if a removal of four miles would be a sufficient distance to prevent the return of bees? The nearest ling heaths are about two miles away, but I do not think my bees go to them for honey.

I have been rather successful for some years past in obtaining artificial swarms from wild bees in roofs, trees, &c. Would any account of my method be of use to your Journal?—A. J. F.

[The stocks which you have nadired are in no danger of dysentery, but we cannot see how you can hope to get artificial swarms in the lower hives, which, moreover, are very likely to contain an undue proportion of drone-comb.

The heather will in some seasons remain in bloom four or five weeks, or even more; in others, such as this seems likely to be, the flowers wither much more speedily. Mr. Isaac states that a weak swarm sent to the heath on the 30th of July returned two months afterwards with an increase of 24½ lbs.; but this is a result much beyond what we have been able to obtain. It is, therefore, questionable whether a swarm driven into a combed hive may be able to store sufficient for the winter, but the supplementary honey harvest will certainly stimulate the queen to increased egg-laying. Bees will not return from a distance of four miles.

We shall be glad of an account of your method of obtaining artificial swarms from wild bees in hollow trees, &c.]

OUR LETTER BOX.

JUDGING GAME COCKS (C. W.).—Game cocks are not judged by weight. They are judged for colour, symmetry, and hard feather. This latter is an important point, and feeding for weight often has the effect of making soft feather. Good barley, a little bread and beer, sometimes a scrap or two of raw meat, and a few old peas given every other day, are supposed to make good plumage.

DIARRHEEA IN FOWLS AND PIGEONS (Subscriber).—We always give chalk made into pills, sometimes a few grains of hempseed, and in urgent cases a spoonful of brandy and water.

WHITE AND BLACK FOWLS (Experiential).—No cross is necessary to produce White and Black Bantams, as they exist as recognised breeds. The White Cochins also exist. Black could not hold their own, as they constantly betrayed a mixed origin. In the days when Black Cochins were attempted and sometimes shown, it was said they were bred between a Buff Hen and a White cock.

CROSS BETWEEN A DORING AND GUINEA FOWL (H. W.).—The cross in question has been seen, and we have seen it, but it is so rare we hardly ever expect to see it again. If you mean to persevere, we advise you to keep the same birds together always, and to allow no others to associate with them.

SPURLESS COCK—ROUP SYMPTOMS (Hamburg).—A cock need not be disqualified because his spurs are cut off. The description of the hen is that of the early stages of roup. She must be purged with castor oil. You should give Baily's pills. If you have them not, or do not care for them, give a couple of camphor pills each the size of a garden pea. It is wise to separate this bird from the others.

EXHIBITING GOLDEN-PENCILLED HAMBURG CHICKENS (Northern Subscriber).—The age at which the chickens can be shown with a prospect of success, will depend on the age of those they have to compete against. In many of the good strains we have seen the chickens, especially the pullets, beautifully marked at from four to five months old. To be shown advantageously the cock should be older than the pullets, as he retains his chicken feathers longer than they do.

BRAHMA HENS' FEATHERS BROKEN (M. W.).—It is too late now to pull the stumps of the feathers out of the backs of your hens. They would not grow in a month. Take the cock away from them. The feathers will come as good in colour as before, unless the process of pulling them out is constantly repeated. In that case they often come white.

FOWLS ROPY (J. G.).—You are not prodigal of information. How large is your earth run? Is the dung heap merely a heap of rubbish, or is it the wholesome sweepings of a well-ordered stable? When you say you feed on barley, is that all the fowls have? We gather so from

your letter. Roup does not interfere with fattening. Feed your birds on barley meal or ground oats. Vary this with a little mize from time to time. Give them a little bread and ale, and to the sickly ones give two camphor pills, each the size of a garden pea. You may give these every night till they make a cure. It is always well to remove sickly birds from healthy.

TESTIMONIAL TO MR. DIXON.—Mr. T. C. Harrison, Beverley Road, Hull, writes to us to say that he will subscribe 10s. 6d. Subscribers had better write to Mr. Hutton, and when the subscription list is completed we will publish it.

HAVE VERY LIGHT (C. T.).—If the hive continues light, we should deem it useless to put on a super.

BEES TAKING LIME-WATER (F. Roberts).—We have had no experience of the effects of lime-water on bees, but do not fancy that yours will have sustained any injury. Water is generally supposed to be essential to bees during the breeding season, but they seem most capricious in this respect, at one time collecting it with the utmost avidity, and then without any apparent reason suddenly disregarding it altogether.

BEES NOT SWARMING, &c. (A Bee-lover).—We fancy the size to your difficulty may be found in the fact that the hive which you purchased was "small" and at the same time "very heavy." When, therefore, the winter was over the poor queen found but a restricted breeding space at her command, which, as the overwhelmingly good honey season set in, became more and more contracted, so that she has been in difficulties ever since, and has never been able to raise her colony to the drone-breeding pitch in respect of population. There is much in what Mr. Pettigrew has advanced concerning large hives, whilst there can be no question as to the propriety of utterly eschewing very small ones. You had better, therefore, appropriate the contents of your honey-choked hive in the autumn by driving the remaining bees and uniting them to your contemplated new purchase, which might in this case take their place in the apiary.

RASPBERRY VINEGAR (T. L.).—Put a quart of raspberries into a quart of the best vinegar, and let them stand a week, stirring them occasionally; then add 1 lb. of loaf sugar, boil slowly twenty minutes, strain, and bottle.

METEOROLOGICAL OBSERVATIONS

In the Suburbs of London for the week ending July 12th.

Table with columns: DATE, BAROMETER (Max, Min), THERMOMETER (Air: Max, Min; Earth: 1 ft, 2 ft), Wind, Rain. Rows include Wed., Thurs., Fri., Sat., Sun., Mon., Tues., and Mean.

- 6.—Fine; cloudy but fine; densely overcast.
7.—Foggy; very fine; clear and very fine.
8.—Very fine; exceedingly fine; overcast.
9.—Fine; showery; overcast; very fine.
10.—Fine; very fine; clear and fine.
11.—Overcast; showery; heavy showers at night.
12.—Cloudy but fine; cloudy; clear and fine.

COVENT GARDEN MARKET.—JULY 15.

Our supply is well kept up, and all the soft and bush fruits are in fair request. There have been heavy arrivals from the Continent, and a further supply of West India Peas is announced. Potato trade active.

FRUIT.

Table with columns: s. d., s. d., s. d., s. d. Rows include Apples, Apricots, Cherries, Chestnuts, Currants, Black, Filberts, Peas, Gooseberries, Grapes, Lemons, Melons, Mulberries, Nectarines, Oranges, Peaches, Pears, Pine Apples, Plums, Quinces, Raspberries, Strawberries, Walnuts.

VEGETABLES.

Table with columns: s. d., s. d., s. d., s. d. Rows include Artichokes, Asparagus, Beans, Kidney, Broad, Beet, Broccoli, Brussels Sprouts, Cabbage, Capsicums, Carrots, Cauliflower, Celery, Coleworts, Cucumbers, Pickling, Endive, Spinach, Artichoke, Herbs, Horseradish, Leeks, Lettuce, Mushrooms, Mustard & Cress, Onions, Pickling, Parsley, Parsnips, Peas, Potatoes, Kidney, Radishes, Rhubarb, Savoys, Sea-kale, Shallots, Spinach, Tomatoes, Turnips, Vegetable Marrows.

From observations taken near London during the last forty-three years, the average day temperature of the week is 73.6°, and its night temperature 50.8°. The greatest heat was 93°, on the 23rd and 24th, 1863; and the lowest cold 32°, on the 23rd, 1863. The greatest fall of rain was 1.48 inch.

POT ROSES FOR EXHIBITION.

ALL true lovers of floriculture agree in calling the Rose the queen of flowers, the most beautiful of all, the loveliest among the lovely; and rightly so too, for in the varieties of this charming family we have flowers of the most exquisite form, the richest colour, and the most delicious perfume. Take, for instance, a partly expanded blossom of Alphonse Karr, in what flower can we find a closer approach to perfection? its shell-like petals, of a pecu-

liarily soft and pleasing shade of pink, are so beautifully fitted to each other that the fine form of the flowers leaves us nothing to desire. The delicate beauty of Lamarque, the magnificence of Charles Lefebvre, the splendour of the deep rich Eugene Appert, distinct and striking in every feature, its dark elegant foliage being in fine keeping with its velvety-petalled blossoms—these, and a host of others possessing some equally distinct feature, are the kinds to grow; these are the rare gems which command our admiration and rivet more firmly the chains of our "old love."

I have frequently asked myself the question, as I doubt not others have done, when viewing the long ranks of cut blossoms staged in their still formal boxes at a flower show, "Is this the best way in which to exhibit the Rose?" I think not. Cut flowers, but too often without buds or foliage, are subjected to the severest criticism shorn of much of their beauty; but if each variety were to be exhibited not cut from the plant, excepting in the case of novelties, but in the form of a pot plant, what a different appearance would a Rose show present: instead of the long lines of flat staging now used, an effect rivaling that of the Rhododendron Show at South Kensington might be obtained with the greatest ease. From my own experience of Rose culture, I can see no real difficulty in the attainment of an object so desirable, but, on the contrary, very much in its favour. Rose cuttings are easily struck, and the plants grown to a considerable size in a short space of time, as I thoroughly explained in an article published in this Journal last year (vol. xvi, pp. 77, 78), and if an annual batch of cuttings were made, a succession of healthy pot plants, as flourishing and prolific as those planted out, could be maintained. If it be objected, that the culture of Roses in this way for exhibition would make greater demands upon one's time and skill, I think this could very justly be met by pointing to the great utility of such plants for home decoration at all seasons of the year. Moreover, by offering the principal prizes for pot Roses, attention would be drawn to a branch of floriculture but too often neglected, or not understood. Who has not seen the miserable specimens of pot Roses so frequently to be met with in private establishments? Poor sickly-looking objects, which, having undergone their annual forcing, are turned out to rest. To rest! why, I do not believe a healthy Rose is ever at rest. Plant one early in November, lift it and examine its roots at Christmas, and plenty of new rootlets from 1 to 2 inches long will be seen; here is a hint from Nature,

which, if acted upon in the culture of pot Roses, produces the best results. If a Rose, after it has done blooming, immediately begins to grow again, suitable food should certainly be given it; it is therefore necessary, when pot Roses are taken out of the houses into the open air, that all weakly growth should at once be cut clean out, the requisite thinning and shortening given to the stronger wood, the roots shaken free of the old soil, repotted, and the pots plunged to the rim, not behind a wall or shed, but in an open airy position. Plants so treated, and fed occasionally with guano water as they appear to need it, will produce plenty of stout wood clothed with healthy foliage, care being taken to ply the syringe among them all the summer.

Once again I would urge all who really care for Roses to grow them on their own roots, and to train them as I have before advised. No standards can equal the appearance of these glorious pyramids, laden with a multitude of flowers. Nor are their flowers small or puny, although produced in such profusion: the plants are rendered so vigorous by the abundance of stout suckers constantly springing up, and which are trained to whatever part of the plant they may be required, that the lowest tiers of branches present an amount of vigour both in wood growth and bloom quite equal to that of the highest parts.—EDWARD LUCKHURST, *Egerton House Gardens, Kent.*

CULTURE OF THE LARGE-FLOWERED OR SHOW PELARGONIUM.

Among hardy flowers the Rose is justly called the queen, and quite as justly may the large-flowered Pelargonium claim the same exalted title among greenhouse flowers: but how very rarely are plants met with grown as they deserve to be! How often, instead, do we find them crammed among all sorts of plants, and subjected to every variety of treatment: hence we generally find spindly long-drawn specimens, often infested with insects to such a degree as to render them a nuisance, instead of a pleasure. Now, no plant is easier to manage, and the following mode of cultivation will bring them to great excellence. At this place we like them in bloom throughout July, and now (July 8th) the collection of upwards of eighty sorts is in full bloom.

I put the cuttings in about the end of May or first week in June, taking what I can spare or get when staking the specimens. I make them in the usual way, and dibble them in an open south border, give them a good watering when first put in, and then leave them to take care of themselves for three or four weeks. I then pot them in 60 sized pots, and keep them close for a few days until they begin to grow, afterwards I give them a little more air. (The frame used when they are potted the first time should have a little bottom heat.) In a few weeks they will have made good roots, and may be hardened off gradually, and about the end of September or beginning of October potted in the next size of pot, or small 48's. When that is done, the best place for them is a shelf in a greenhouse, and when they have made a fresh leaf or two

zip out the point of the shoots. They should be again shifted, using 6-inch pots, in which size they should bloom the first year.

After they have finished blooming, or begin to look shabby, they should be placed out of doors, and not watered much for a fortnight, when they will be ready to cut down, which operation should be performed with a sharp knife, cutting them down like an Osier stump, and leave them outside until they have broken well, when they should be carefully taken out of the pots, and have every bit of the old soil shaken out, and the ends of the long roots shortened. They should then be potted into their blooming pots, placed in a warm frame or house, and be only sprinkled until growth commences, care being taken not to make them too wet, or the soil will turn sour. They should always have plenty of room and light, and abundance of air whenever it can be given, for that is one of the secrets of success. Always be on the watch for green fly, and as soon as that makes its appearance give them a good tobacco fumigation for two successive nights.

Keep a very low temperature all winter, and nip out the points of long shoots till February, after which time it should not be done. No liquid manure should be given till the flower buds begin to form, when they should have some once a week. When the shoots are long enough they should be thinned if they require it, and tied out to neat straight sticks, which are best made out of plasterers' laths. Watering must be well attended to, for if they are allowed to become very dry they soon suffer, and produce small yellow leaves, and a warm dry temperature is very conducive to filth of all sorts.

The following compost I find answers extremely well:—To four barrowloads of good pasture loam I add one of old Mushroom-dung, one of charcoal broken up fine, one of very old leaf mould, and one of coco-nut fibre refuse, the whole well mixed. I drain the pots with charcoal.

The following varieties are all distinct, first-rate, and would form a good small collection, of course plenty of others might be added:—*Troubadour*, *Progress*, *Charles Turner*, *Heidcock*, *Favourite*, *Viola*, *Hermit*, *Decision*, *Congress*, *Beauty of Windsor*, *King of Trumps*, *Queen of White* (Dobson's), *Rob Roy*, *Emperor*, *Victor*, *Magician*, *Diadem*, *Example*, *Queen of Scots*, *Turban*, *Mary Hoyle*, *Captain John*, *Lord Lyon*, and *Lady of the Lake*.—*RICHARD JAMISON, Gurgave.*

STRAWBERRY CULTURE.

THE crop generally in this district (Lincolnshire) is prolific, and the most prolific of all the varieties under my immediate care is *President*.

In an enumeration of several varieties, with their qualities and characteristics, contributed to the *Journal* two years ago, I unhesitatingly accorded to this variety the place of honour, which it continues to hold worthily. I am inclined to think that it is most at home on a rather light soil. Runners which I have supplied for cultivation in gardens on heavy soil, have, as a rule, been rather unsatisfactory, producing a superabundance of foliage. Those, then, having a light staple of soil to deal with, I advise to grow this variety, and if it serve them as well as it year by year has served me, it will be pronounced worthy of its name.

My plants, now yielding so well, are of the earliest last year's runners, bearing their first crop, and I am confident it is the best they will ever produce. Every year's experience tells me that to insure satisfactory crops of Strawberries on soils of the character of a light vegetable mould, we must secure runners as early as possible, treat them well throughout the season, and depend on their first efforts for the best yield. If by adversity of weather or any other kind of adversity, plants cannot be secured sufficiently early for permanent planting in July, after early Potatoes, it is good practice, taking into consideration the economy of the general cropping of the garden, to wait for very late runners—small ones—and prick them in nursery beds quite at the end of September, or in October. For the convenience of hoeing, &c., the rows should not be nearer together than 9 inches, and the plants in the rows may be 4 or 5 inches apart. Here let them remain until an early crop is off in spring—say the crop of early Potatoes, which I, as a rule, like them to follow, but cannot always make them do so—this year for instance. I can see nothing clearer than to plant after early Cabbage, but it goes rather against the grain, and I can only keep a smooth surface by reflecting on a mixture I have in reserve, composed mainly of old Strawberry plants and clearings of the beds last year, kept in a separate rot heap. This,

with a lot of old plants in their last stage of existence, and which will be cleared off and put at once green into the trenches, will act both as a sedative and stimulant, and animal and vegetable—that is, myself and plants, will be mutually benefited.

This plan of manuring Strawberries with Strawberries is as good in practice as it is in theory, and was the secret of success of an amateur cultivator, a clergyman in this neighbourhood, who for years produced off the same ground magnificent crops of fruit by this system of manuring. I have also tried it myself, and have not found it wanting—in fact, it is the root of the matter over which at present my President presides so worthily.

Plants treated on the plan described, other things being favourable to their well-being, are sure to bear splendidly—quite as well as, perhaps better than, plants from early runners encouraged and planted at once in the fruiting-bed for the next season's bearing. But why not plant out sooner? some may ask. Why wait until the end of June, or till July? Simply this, by planting good plants of *Strawbericia* in March or April, as is frequently done, you insure good crops the following season, but by waiting two or three months longer you insure not only a good crop of fruit, but also a good crop of early Potatoes, off the same ground. Putting this against the planting of fine early runners in the permanent beds at once, a season is certainly lost; but when once fairly in the system the loss dwindles away, and the only disadvantage it has, looked at in the general economy of cropping, is the bit of ground occupied as nursery beds for the half year beginning in October. The principal point to be attended to, is the planting runners small and late, or they will be drawn and injured by remaining in the nursery bed so long.

Strawberries on soil of this nature do not, as a rule, give more than two fine crops. I sometimes let them bear three, but the last has never yet satisfied me. I do not "bury cart-loads of manure;" I bury the refuse above mentioned, and then point in the surface 2 or 3 inches of yellow loam, if I can obtain it mixed with old hotbed manure, just to give the plants a start; but the principal amount of manure is put on not in the ground. After planting, which is not done until the ground is well firmed to give it "body," the best substitute for "heart," the whole surface is well covered, and kept covered. The surface of the ground is never bare summer nor winter, and is not disturbed by fork nor spade. The manure used for this purpose is not decayed, but is in a comparatively green state, and by the washing of rains, and exposure to the weather nothing is seen but strawy material, clean and close, for the fruit to lie on, no further attention being required in this respect.

It is to this surface dressing arresting evaporation, that I mainly attribute success in Strawberry culture on light soils. Undoubtedly, on some soils, Strawberries will yield productive crops for four or five years, or by carefully thinning the crowns even ten years; but for soil of the character I deal with in this paper, the system of long-standing plantations breaks down; at least, this is my experience. For such soils plant frequently, mulch, and mulch continually, ever bearing in mind Mr. Radclyffe's advice, always sound, Do not pack the mulching closely round the hearts to blanch them, or farewell Strawberries.—*J. W.*

EARLY VERSUS LATE PLANTING RIBBON BORDERS.

(Concluded from page 3.)

In continuation of the above subject, although I praise early planting, it is, as I have already remarked, often from necessity rather than choice. Forcing houses and pits become overcrowded, and the other means of sheltering the plants being insufficient, we are often reluctantly compelled to thin them out; for, supposing the plants in single pots were only wanted to plant the two borders described in my former article, and that twenty rows of plants, each about 200 yards in length, were wanted, these alone would make upwards of two miles and a quarter of single row, too many for the accommodation we have, and as we have other beds and borders as well, an easy way of accomplishing the object has to be adopted.

The management of *Calceolarias* is easy enough; cuttings put very thickly into a cold pit in October or November are thinned out very often in March, and the plants left are quite large enough for turning out by the end of April; if the ground is in tolerable condition, and the site not too much exposed to east winds, they will often succeed well. At all events, they

are about the hardiest of bedding plants, and in our case were transplanted direct with balls from the cold pit to the borders, some before Easter Sunday, and some the week after, the dry weather at the time interrupting the operation. Next came *Verbena pulchella*, a tolerably hardy kind, but still one that likes warm weather better than cold, and I believe a better result would have followed had we waited a fortnight, but the plants had become stunted by confinement in a crowded state in the cutting pans and boxes, and required more room; so, trusting to the weather, we planted them out at once on April 30th, excepting a few not sufficiently struck at the time, which were put out a fortnight afterwards. Their progress was, of course, slow for a time—nay, I am not sure that they did not retrograde; still, none of them died, or but very few, and they now (June 9th) promise soon to occupy their allotted space.

I now come to the *Pelargonium*. The balk of these are wintered in wooden boxes 2 feet long by 1 foot wide and 3 inches deep for young plants, and 1 or 2 inches deep for older taken-up plants. Now it often happens that these small plants become very much drawn by the middle of April, so that a fresh lot of cuttings is often taken off; and in some seasons we have shaken them out of the boxes, tied a little moss and soil round hundreds of them, and placed them on a slight hotbed or in a sheltered position for two or three weeks before planting; but this season circumstances prevented our doing so, and there was no alternative but planting them out directly from the cutting box. The question then arose, Was it prudent to do that work early, or to wait till others were planting out their potted plants? This was the way to put the matter, and not, Which is the proper time to plant in general? Observe, I am not advocating early planting where there exist the means of keeping the plants in a suitable condition till a more genial season arrive, yet the results of early planting are not always so discouraging as to render it entirely unworthy of support. I remember the best bed of *Pelargoniums* I had one year was planted in April, but the plants were covered with Laurel boughs for a time, a practice I have often adopted with early planted-out subjects, but which I had not the opportunity of practising this year. On the other hand, one season we suffered much by a frost late in May, I think the 23rd or 24th, when a number of plants of *Perilla* were quite killed, and the *Pelargoniums* and other bedding plants much hurt, while those not planted till after that time succeeded much better. The air and plants at the time of that frost were both moist, hence the injury. The thermometer on the morning of May 23rd was lower than I have ever registered it in May during the last twenty years, being 27°, and that for many hours too; but the air was dry, and the morning dull, so that the injury done was not so great as, from the severity of the frost, might be supposed. In other frosts during the same month, the shoots of Oak, Ash, and other trees were blackened.

In connection with early planting, the state of the ground must be set down as an essential condition of success, and it has generally been one of our difficulties, as the soil of our flower beds, though well adapted for sustaining a long summer's growth, is not the best to work early in the season, for it is what is termed a stubborn soil, and in some seasons is much worse than in others. This year has been one of the best, while 1869 was bad. So stiff is the ground sometimes that we are obliged to obtain some fine soil from elsewhere to plant in, or rather to cover the roots of the little plants assigned to such hard lumps. I well remember the expression of a gardener of high standing who visited me one season when the soil was of the coarsest description, and the men were fixing down the shoots of *Verbenas*, not with pegs, hair-pins, or strips of matting, but with clods of the sun-dried earth, about the size of a cricket ball, obtained on the spot in any quantity. Such rude treatment amused my friend, who, doubtless, expected more from his own neatly manipulated beds, but a genial rain setting in soon after melted down these weights, to the advantage of the plants I believe. A rather long continuance of dry weather followed, and then it came to my turn to visit my friend's garden, and the lough was turned against him; his smooth ashy-looking soil had not been able, with the aid of the water of a canal that flowed past it, to support his *Verbenas* in health, while mine were all that could be desired. However, a certain degree of pulverisation is necessary at planting, and I am in the habit of looking as much at the state of the ground as at that of the atmosphere; nevertheless, it must be acknowledged, that when the two are combined the best result follows. The condition of the plants,

however, has a great influence in hastening or delaying planting out, for to wait till a plant falls into bad health from crowding or lack of nourishment at the root, is often equivalent to waiting till disease sets in. *Calceolarias* are especially liable to suffer from this cause. The Variegated and Ivy-leaved *Pelargoniums* appear to bear such treatment as well as any plant, but it cannot be said that they are improved by it.

Although I have mentioned some subjects which may be planted out early without dying, yet there are others it would not be prudent to try. *Heliotropes*, *Tropaeolus*, *Ageratums*, and even *Labellias* are less hardy than the plants I have named; while *Alternantheras*, *C. Russes*, *Caster Oil plants*, and the like, are still in me delicate. On the other hand, *Petunias* are tolerably hardy, so, too, are *Geraniums*, *Narcemburgias*, and *Centaureas*. The last named, however, has suffered more with me this past winter than it has ever done before.

I would now invite the opinions of others on the subject, whose practice, if recorded, may do much either to condemn early planting, or to support it as not being so detrimental as it is supposed to be; for, be it remembered, if it can be proved that a plant turned out, say on the 25th of April, is as good on the 25th of June as one turned out on the 25th of May, the advantages of getting the first planted one out of the way are such as to render the earlier planting preferable, the state of the respective plants at turning-out time, and other conditions, being the same. But I have already said enough, and I expect our worthy mentor, "R. F.," will find many and cogent reasons for delaying his planting so late, each of them important to the planter. Nevertheless, I advocate early planting where circumstances, as here, almost compel its adoption.—J. ROBINSON.

THE STRAWBERRY SEASON.

I HEAR on all sides, "I have no Strawberries!" Here they never were finer nor more plentiful. I like a West Indian summer for fruits and flowers. All that is wanted is sufficiency of manure, and water equal, in some measure, to excessive evaporation. I have had magnificent crops of Rivers's *Eliza*, *Cockscomb*, *Wonderful*, *Dr. Hogg*, and *Mr. Radclyffe*, of which the last-named is the best in flavour. In constitution, setting its fruits, and colour, it is superior to the *British Queen*; in other respects, and especially as regards flesh, flavour, and foliage, it is identical. I had some very fine early and highly-flavoured berries of *Foote's*, which should be more known. I think *Mr. Radclyffe* and *Dr. Hogg*—the two finest in the Queen line—succeed best by early annual (say July 1st) plantation. I took on July 5th a noble lot of Strawberries, consisting of *Mr. Radclyffe*, *Dr. Hogg*, *Wonderful*, and *Cockscomb*, to *Sir William Marriott's* cricket-mead—(a match between his eleven and eleven of the 7th Fusiliers, quartered at Donchester. *Sir W. Marriott* and *Capt. Glen* measured the largest *Cockscomb* with tape marked with the inches, and it was 11 inches in circumference. I enclose *Sir William's* letter for the Editors' perusal. This I do, because people who grow Strawberries the size of "snags," cannot still believe that I grew one last year 12 inches round. They do not appear to have measured the largest of the *Dr. Hogg* Strawberries, which, I believe, ranged from 7 to 9 inches. It is a noble Strawberry, but not equal to *Mr. Radclyffe* in flesh, flavour, and colour. I should, however, be inclined to recommend it to careless people rather than *Mr. Radclyffe*. They are both easy to cultivate, and neither are particular as to soil.

The *British Queen* hates chalk, but these, too, I have grown successfully in the chalky soil of *Itashton* and in the sandy loam of *Oxford*. The *Bicton Pine* and *Frogmore Pine* are not in crop this year. The *Alpines* have been most abundant. *Galanda* is a splendid red *Alpine*. I wonder people do not grow *Alpines*. With a little sugar, I think they are the finest flavoured of all Strawberries.

Last year my runners of all sorts were planted July 1st. This year I made my new beds July 4th, 5th, and 6th. Early establishment is a great matter, also firm ground. I plant after Cabbages, which are kept constantly loe'd, and I do not dig the ground at all. Holes, 19 inches apart each way, are scooped out, and filled with liquid manure, and in due time the runners are put in with loam and decayed manure sifted fine, and trodden in as hard as it is possible to do. The runners are then kept sufficiently watered. The hotter the weather is the better it is for the new plantation. The July plants of last year are now larger than some people's three-year-old plants.

Two years, except in rich clays, is, I think, long enough for many sorts to stand.

The only novelties on trial here were Dr. Roden's two seedlings, the Duke of Edinburgh and Early Prolific, and Mr. Segrave's (of Marlow) Royalty. The Duke is a superior Strawberry for form, flesh, and flavour, but here it is too dwarf in growth. The Early Prolific is a better grower, and has a pleasant flavour. Royalty appears to be the same as the Scarlet Pine, or Rival Queen, in foliage, form, flesh, flavour, habit, and appearance. It has the same fault—namely, it is a precarious setter, but of a most rich and excellent flavour. I should not have got rid of the Scarlet Pine or Rival Queen—in the same line—had they been good setters. I cannot, hereafter, try Strawberry plants or Potatoes for anyone.—W. F. RABCLIFFE, *Oxford Fitzpines*.

THE ROYAL HORTICULTURAL SOCIETY'S OXFORD SHOW.

Oxford is a city with a long history—a longer history than one cares to recount, for it goes back a thousand years and becomes lost in the mist of time; for nearly that period, if not quite, there science, and art, and literature have flourished, and the disciples which its many colleges have sent forth have carried the stored-up learning of past generations and their own into the wide world. Who, then, can tell its history? Who the influence it has had on the things that be? Nor is it without a history in another sense—war has been no infrequent visitant at its gates—and alas! while we write these words war again is about to deform the fair face of Europe, and such a war, and between such nations! *Terruit ubi, terruit gentes*, that, perhaps, is the reason that when we left Oxford yesterday neither Horticulture nor Agriculture was so well countenanced as we should have wished. Still, the Show which commenced on Tuesday, and is to close on Friday next, is one well worthy of special attention, and of special encouragement also. It is worthy of attention even by the frequenters of the London shows from its own merits as a show, and as an indication of the state of horticulture in the provinces; it is worthy of attention by those in the provinces, for it brings to their doors what many would never see without a long journey, perhaps never see at all; and it is deserving of encouragement both by town and country for this reason, and because it benefits both; and more—still more, it brings men from all parts of the land into social contact, cements old friendships, and forms new. It is more especially at these country shows the gentlemen and the gardener come together, they converse with each other, and they learn from each other; each gains in information, and each can better appreciate the other. Thus the strong wall which is built up between man and man, and class and class, is breached, and we believe—we feel sure—to the benefit of the gardener's art, to the benefit of the community at large. The details of the Show, which is held in the grounds of the Radcliffe Observatory, and which, with the combined Show of the Royal Oxfordshire Horticultural Society, occupies eight large tents, will be found in the following reports. To these we purpose giving some additions next week, together with a notice of the Congress, which commenced yesterday at too late an hour for us to enter into details. So far the weather has been everything that could be desired, were it not for the drawback of a tropical temperature. Let us hope that the results in every sense will be equally favourable.

MIXED GROUPS OF FLOWERING AND FINE-FOLIAGED PLANTS.—For these prizes of £25 and £15 respectively were offered by the Royal Horticultural and Royal Oxfordshire Societies. The former is taken by Mr. Baines, gardener to H. Micholls, Esq., Southgate House, Middlesex, who is first with a remarkably fine collection, consisting of *Dipladenia crassinoda*, very well bloomed; *Dipladenia amabilis*, the large flowers of which are in beautiful condition; a splendid specimen of *Erica obtata*, 5 feet in diameter; *Ixora coccinea*, loaded with magnificent heads of its brilliant scarlet flowers; *Allamanda nobilis*, very fine; an unnamed very free-flowering *Allamanda*; *Ixora aurantiaca*; *Bongainvillea glabra*, forming a charming mass of rosy bracts; *Phorocoma prolifera* Barnesii, in good bloom, but not large; and an excellent plant of *Erica amula*. Of fine-foliaged plants Mr. Baines has *Croton variegatum*, with its colour most beautifully developed; of *Gleichenia rupestris* a large specimen extremely beautiful and delightfully fresh; *Theophrasta imperialis*, very fine; *Dasyliroa acrobichum*; a remarkably fine specimen of *Phenacophorum sechellarum*; a very large plant of the equally beautiful and not dissimilar *Verschaffeltia splendida*; *Dicksonia antarctica*; *Croton angustifolium*, large, and with the golden variegation fully developed; *Yucca variegata*; and a good specimen of *Cordylina indivisa*. Mrs. E. Cole and

Sons, withington, Manchester, are second with a very good collection, consisting of *Dipladenia crassinoda*, *Allamanda cathartica*, *Genetyllis tulipifera*, *Aphelaxis humilis grandiflora*, *Dipladenia acuminata*, *Phorocoma prolifera* Barnesii, a very large bush of *Erica Cavendishii*, *Aphelaxis macrantha rosea*, an excellent *Kalosanthes punicea*, a rather poor specimen of *Erica Parmentieriana rosea*; while of fine-foliaged plants the collection contains excellent specimens of *Croton variegatum*, *Dicksonia antarctica*, variegated *Yucca*, *Livistonia borbonica*, *Croton angustifolium*, and *Dasyliroa acrobichum*.

STOVE AND GREENHOUSE PLANTS.—Mrs. Cole & Sons also send the best collection of nine stove and greenhouse plants in flower. This consists of excellent specimens of *Ixora coccinea*, *Dipladenia amabilis* in fine bloom, *Aphelaxis macrantha purpurea*, *Kalosanthes punicea*, *Dipladenia crassinoda*, *Gomphobium polymorphum splendens*, and fair examples of *Ixora javanica*, *Allamanda grandiflora*, *Dipladenia crassinoda*, and *Phorocoma prolifera* Barnesii. The second prize goes to Mr. F. Perkins, Leamington, who has fine plants of the large-flowered *Allamanda Hendersoni*, *Stalicia imbricata*, *Vinea rosea*, and others of less note. Messrs. Bell & Thorpe also show in this class, and have a very good plant of *Dipladenia amabilis*, the yellow-flowered *Cassia corymbosa*, and well-bloomed *Stalicias*. The special prize offered by F. J. Morrell, Esq., for the best specimen stove plant in flower is taken by Mr. Baines, gardener to H. Micholls, Esq., with a specimen of *Allamanda cathartica*, forming a balloon 5 feet by at least 2½ feet across; and the second prize, given by the same gentleman, goes to Messrs. Standish & Co., of the Royal Nurseries, Asea, for the third prize is awarded to the singular-looking *Aristoebelia ornithocephala*, from Mr. F. Perkins, nurseryman, Leamington. Messrs. Gill's prizes for the best and second best specimen greenhouse plants go to Mr. Baines for a very fine plant of *Erica Fairriana*, 4 feet in diameter; and the second to Mr. A. Wright, gardener to C. H. Crompton Roberts, Esq., Regent's Park, London, for a very good specimen, though rather past its best, of *Kalosanthes Madame Celeste* Wianans. In the local class for six stove or greenhouse plants, Mr. G. Harris, who is first, has a very well-grown *Clerodendron Thomsonae*, but its bloom over, a very good *Rondeletia* is also exhibited, and *Asclepias currasavica*, a showy plant, but seldom seen, and in this instance straggling; the others do not require notice. The second prize goes to Mr. J. Walker for a good pot of *Lilium eximium*, *Caladiums*, and *Colasenas*. The "Florist and Pomologist" prize for stove and greenhouse plants was awarded to Messrs. Bell & Thorpe, Stratford-on-Avon, for a collection in which there is *Abutilon Thompsoni* with a few flowers, two *Petunias*, a *Lantana*, *Diplacus grandiflorus* in good bloom, and *Lilium auratum*.

ORCHIDS.—But few are shown; there is only one collection in the amateurs' class for six, which comes from Mr. A. Wright, gardener to C. H. Crompton Roberts, Esq., Regent's Park, who has *Oncidium Schieperianum*, *Lycastes*, *Acridas*, a *Cattleya*, and other plants not remarkable. Mr. Williams takes the corresponding position in the nurserymen's class with *Anguloa Clowesii*, *Dendrobium Parishii*, showy; *Vanda suavis*, *Acridas quinquevulvatum*, *Cypripedium superbum*, fine, and a very good pan of *Cypripedium barbatum superbum*. Messrs. Rolleston & Sons are second with a fine specimen of *Acridas odoratum majus*, with about two dozen fine racemes, *Acridas Lobii* with half a dozen, *Epidendrum vitellinum majus*, fine, a good pan of *Cypripedium barbatum majus*, and *Odontoglossum hastilabium*.

HERBACEOUS.—The silver cup, offered by W. Wootten-Wootten, Esq., goes to Mrs. E. Cole & Sons for excellent plants of *Erica Parmentieriana rosea*, *ventricosa magnifica*, *feruinea superba*, large and fine, *venosa*, a well-grown *emula*, and good but smaller specimens of other kinds. The second prize, offered by Lord Valentia, goes to Mr. A. Wright, gardener to C. H. Crompton Roberts, Esq., for a large specimen of *ventricosa Bothwelliana* in profuse bloom, the showy scarlet *cerinthoides variegata*, and good examples, though not large, of *tricolor* Wilsoni and *Fairriana*. The special prize, offered by the Warden of New College for six, is taken by Mrs. E. Cole & Sons with good plants of *venosa*, *ventricosa magnifica*, *gemmifera elegans*, with others less remarkable. Messrs. Grindley, Hughes, and Dewe's prize is taken by Mr. A. Wright with an evenly-grown lot of plants, though rather small.

FINE-FOLIAGED PLANTS.—These make a good display, although the specimens are not remarkable for great size. Mr. Johnson, gardener to the Marquis of Ailesbury, Savernake, takes the first position in the amateurs' class for nine, with very good specimens of *Alcaecia metallica*, a fine *Caladium Belleyeii*, *Sansevieria angolensis*, *Pandanus elegantissimus*, *Croton angustifolium*, a fine healthy plant of *Spherozygia latifolia*, *Alcaecia macrorhiza variegata* with its leaves three-fourths white, and a very good specimen of *Croton variegatum*. The second prize goes to Mr. A. Wright, who, among other plants, has the extremely graceful *Cupania filicifolia*, *Demonorops plumosus*, an elegant *Palm*, and other good specimens. The best nine in the nurserymen's class come from Mr. Williams, who has a splendid plant of *Alcaecia metallica* in perfect condition, a fine *Phenacophorum sechellarum*, *Dasyliroa plumosum*, *Cycas revoluta*, very fine; a large and very pretty *Cordylina indivisa*, and a fine *Yucca quadricolor*.

PALMS.—These are not very numerously shown. Mr. B. S. Williams is first with noble plants of *Phenacophorum sechellarum*, *Livistonia Jenkinsii*, and *Verschaffeltia splendida*, the others being fine specimens of *Chamerope humilis*, *Areca lutescens*, and *Thrinax elegans*.

Messrs. Rollisson are second with a pretty collection, prominent in which are fine plants of *Chamaecyparis erecta*, *Thrinax argentea*, and others.

CORYLIANS AND DRACENAS.—Here Mr. Williams, of Holloway, takes the lead with very fine plants of *Dracena atrosanguinea*, *D. lineata*, *D. anastralis*, not a large but a beautiful young specimen, and *D. umbraeflora*. Messrs. Bell & Thorpe are second with very small specimens, and Mr. S. Daniels, gardener to the Rev. S. R. Keene, Syoncombe Park, third.

FERNS.—Of these there is not so large a show as on some former occasions, but the want is more than made up for by the quality of those shown. Mr. Williams, of Holloway, is first for nine with large and fine examples, with fronds of the greatest freshness, consisting of *Cyathea dealbata*, *Todea africana*, two good *Gleichenias*, *Cibotium Schiedei furcans*, *Dicksonia squarrosa*, *Davallia dissecta*, very beautiful, *Dicksonia antarctica*, and a particularly fine and very wide-spreading *Cyathea princeps*. Messrs. Bell & Thorpe, Paddock Nursery, Stratford-on-Avon, are second with a very good Bird-nest Fern, and small well-grown specimens of *Cibotium*, *Alsophilas*, *Blechnum corceadense*, &c. Mr. J. J. Chater is third. In the amateurs' class for six, Mr. Baines takes the first position for a specimen of *Gleichenia splechnae* most beautifully furnished, and measuring nearly 5 feet in diameter; good examples of *Cyathea dealbata* and *medullans*, *Davallia bullata*, fine; *Davallia tenuifolia*, and a fine pan of *Todea superba*. The second prize goes to J. Mapplebeck, Esq., Woodfield, Moseley, Birmingham. The first of the special prizes given by H. Grisewood, Esq., was awarded to Mr. Wright, gardener to C. H. Crompton Roberts, Esq., Regent's Park, for a collection containing a beautiful *Adiantum fadyense*, *A. emarginatum*, *Cibotium Schiedei*, *Lomaria gibba*, *Dicksonia antarctica*, and *Cyathea princeps*. Messrs. Bell & Thorpe are second. A first-class certificate was awarded to Messrs. Wood & Ingram for a new variety of *Lomaria nuda*.

The best pair of Tree Ferns are from Mr. Williams—viz., *Dicksonia antarctica*, and *Cyathea Smithii* about 12 feet high; the second best come from Mr. C. Walton, Cowley Road, Walton; and are a well-grown pair of considerably less size, round the trunks of which is trained white variegated Ivy.

BRITISH FERNS.—Of these, J. E. Mapplebeck, Esq., Woodfield, Moseley, Birmingham, has a well-grown collection of twelve, in which are very good specimens of *Scelopendrium vulgare crispum*, *Trichomanes radicans*, *Athyrium Filix-foemina Priebradii*, and others. For this a second prize is awarded. E. J. Lowe, Esq., Highfield House, Notts, is third with a pretty collection, in which we particularly noticed *Osmunda regalis cristata minor*, *Scelopendrium vulgare optatum*, *Polystichum angulare decompositum*, and *A. F. f. plumosum Monkmani*. Mr. Caswell, St. John's Terrace, Oxford, is awarded the first prize. The local exhibitions of Ferns from Messrs. Chapman, Callam, and Castell in the class for twelve, and Messrs. Belcher, Howlett, and Walker, are very good. The best twelve in the nurserymen's class are from Messrs. Ivory, of Dorking, and consist of *Athyrium F. f. trifidum*, lanceolatum, *Girdlestonei*, *ramo-cristatum*, *formosum-cristatum*, *Fieldie*, *plumosum*, *Polystichum angulare cristatum*, *acuto-dissectum*, *Lastrea Filix-mas cristata*, *Iveryana*, and *Osmunda regalis cristata*. The Right Hon. E. Carlwell's first prize for twenty British Ferns is also taken by Messrs. Ivory & Son, of Dorking, with *Athyrium F. f. Granite*, *formosum cristatum*, *grandiceps*, *Girdlestonei*, *conioideis*, *plumosum Axminster var.*, *plumosum*, *fissidens*, *Vernonia*, *pulchellum*, *corymbiferum*, *Osmunda regalis cristata*, *Polystichum angulare plumosum*, *incisum*, *conspicuosum*, *Lastrea Filix-mas Pindleri*, *cristata Iveryana*, *A. F. f. Fieldie lanceifolium*, and *Trichomanes radicans*. The second and third are awarded to J. E. Mapplebeck, Esq., and E. J. Lowe, Esq.

In the very extensive collection of British Ferns shown by E. J. Lowe, Esq., of Highfield House, Nottingham, the following received first-class certificates—viz., *Asplenium marinum ochmibianum*, *Polystichum angulare monogones*, *Lastrea F. mas acceptum*, *Athyrium F. f. strobiliferum*, *A. F. f. exemplum*, *Scelopendrium vulgare corculum*, *S. v. kraspedon*, *S. v. krosson*, *S. v. marginis*, *S. v. perikallion*, *S. v. stephanoides*, *S. v. poluskiston*, *S. v. semnon*. J. E. Mapplebeck, Esq., also received several first-class certificates for new forms—viz., *Athyrium F. f. defecto-sectum*, *A. F. f. caput-Meduse*, *A. F. f. Jonesii*, *A. F. f. densissimum*, *A. F. f. treccillans*, *A. F. f. Craigii splendens*, *A. F. f. flabelliforme cristatum*, *A. F. f. Gilsoniae furcans*, *A. F. f. conicum*, and *Polystichum angulare brachiato-cristatum Smithii*.

PELARGONIUMS.—For six double-flowered Pelargoniums prizes were given by the Rev. W. Vernon Harcourt. The first of these was taken by Mr. Bragg with *Gloire de Nancy*, *Madame Lemoine*, *Capitaine L'Hermite*, *Victor Lemoine*, and *Marie Lemoine*. The plants are not large, but on the whole well bloomed. The second prize was awarded to Messrs. Bell & Thorpe for coarse-looking plants. Of double-flowered Pelargoniums shown in Class 18, Mr. Perkins, of Leamington, has *Marie Lemoine*, *Madame Lemoine*, and *Wilhelm Pützer* in fine bloom, the first with a profusion of trusses. Messrs. Downie and Co., of Stanstead Park, are second with excellent specimens; Messrs. Bell & Thorpe third with immense plants, but with few flowers in comparison to the quantity of foliage; and Mr. House, of Peterborough, is fourth.

The best stand of twelve varieties of double-flowered Pelargoniums, five trusses of each, comes from Mr. Perkins, of Leamington, and

consists of *Triomphe*, *Madame Rose Charmeux*, *Andrew Henderson*, *Madame Michel Buckner*, *Marie Lemoine*, *Victor*, *Triomphe de Thameuil*, *Capitaine L'Hermite*, *Wilhelm Pützer*, *Victor Lemoine*, *Madame Lemoine*, *Gloire de Nancy*. The second prize went to Messrs. Kelway & Son, of Langport, and the third to Messrs. Carter and Co.

The best six variegated Zonal Pelargoniums come from Mr. Turner, and consist of very well-grown specimens of the following white-edge kinds—viz., *Compactum*, *Jane*, *May Queen*, *Albion Cliffs*, *Miss Bridges*, and *Princess Alexandra*. J. E. Mapplebeck, Esq., comes second with plants 2 feet across, well-clothed with foliage, and Mr. Perkins, of Leamington, third. Mr. Welsh, gardener to D. Rutter, Esq., Parkfield House, Hillingdon, is first in class 18, for six Tricolor Pelargoniums, with excellent plants, both in growth and leaf-colouring, of *Lucy Grieve*, *Sophia Casarek*, *Comtesse de Tyronnel*, *Lady Callam*, and *Sophia Damaresque*. Mr. Stevens, of Ealing, is second, and Mr. Turner third, the latter with small plants of which *Achievement* is noticeable for the brightness of its zone, while Sir Robert Napier is equally conspicuous for its dark zone. Another third prize was awarded to Mr. Tomkins, Spark Hill, Birmingham. The special prizes given by Sir A. W. Peyton, Bart., go to Mr. Welsh for compact well-grown plants of Mrs. Turner, *Imperatrice Eugénie*, *Sophia Casarek*, *Lady Callam*, *Glen Eyre Beauty*, and *Edwinia Fitzpatrick*. Mr. Stevens, who is second, has also good plants. The best four Zonal Pelargoniums (not variegated) shown in Class 89, in which special prizes are offered, come from Messrs. Bell & Thorpe, and consist of *Eleanor*, *Gloire of Waltham*, *Mr. William Paul*, and *Lady Constance Grosvenor*, and are well-grown and bloomed plants of 2½ to 3 feet in diameter. The others are not remarkable. The best six in Class 15 also come from Messrs. Bell & Thorpe, and are well-grown and bloomed, and include a good scarlet seedling called *John Thorpe*, *Eleanor*, *Lord Derby*, and *Fairy Princess*. Mr. Walker of Thame, is second, the best being a very fine plant of *Amy Hogg*. Mr. J. Chater, of Cambridge, is third.

Cut trusses of Zonal Pelargoniums are also shown. In the class for three trusses of twelve varieties there are several excellent stands, especially the winning ones from Mr. Walker, of Thame, Mr. C. J. Perry, and Mr. Minchin, of Hook Norton.

PELVAS present a gay appearance, especially the single-flowering sorts from Messrs. Bell & Thorpe, who are first for six. The special prize offered by the Warden of Wadham College for double-flowering kinds is taken by Mr. Harris, Headington Hill, with very well-grown plants trained on flat wire trellises 3 feet in diameter.

SUCCULENTS.—Of these Mr. Williams, of Holloway, has an excellent twelve, for which he takes the first prize. Among them are *Agave Verschaffelti*, *Dickia Verschaffelti*, very handsome; *Agave Schidigeri*, *Agave filifera major*, another thready-leaved kind; *Echinocactus Pfeifferi*, *Aloe socotrina*, and *Rhipidolobum plicatile*. Mr. Ware, Hale Farm Nurseries, Tottenham, is second with a collection mainly consisting of *Echeverias* and *Sempervivums*, and Messrs. Bell & Thorpe third. In this is the singular-looking cup-shaped *Greenovia aurea*; there is also a nice pan of *Sempervivum arachnoideis*. Mr. J. Chater, of Cambridge, also exhibits, and Mr. Ware has a numerous and interesting miscellaneous collection.

ROSES make a grand display, the stands of cut blooms occupying the whole of one side of the long fruit tent and part of the other side. In forty-eight single trusses Mr. J. Cranston is first with, among others, beautiful examples of *La France*, *La Boule d'Or*, *Senateur Vaisse*, *Niphotos*, *Sophia Coquerelle*, *Maréchal Niel*, *Gloire de Dijon*, &c. Mr. Turner is second with very fine trusses, and equal third prizes go to Messrs. Paul & Son and Mr. Cant, of Colechester, while Messrs. Lee, of Hammersmith, are fourth. In the amateurs' class for the same number Mr. C. J. Perry, of Castle Bromwich, takes the first position. Mr. Moore, gardener to T. Lloyd, Esq., Warwick, being second, and Mr. Johnson, Uxbridge, third. In the amateurs' class for twenty-four Mr. Moore is first, Mr. Johnson, Uxbridge, second, and Mr. C. J. Perry third. For twelve the principal prizes go to Mr. Cavell, Walton Manor, and Mr. Tranter, Upper Assenden; while for six Mr. Tranter takes the lead. For twelve Roses sent out in 1867 Mr. Turner is first with *Elie Morel*, *François Fontaine*, *Baroness de Rothschild*, *Deviennes Laury*, *La France*, *Miss Poole*, *Duke of Edinburgh*, *Marie Girod*, *Edward Morren*, *Nardy Frères*, and *Comte de Hainault*. Messrs. Paul & Son are second, and Mr. Cant third. Prizes were offered by J. Thomson, Esq., for nine yellow Roses, and were carried off by Messrs. Paul & Son, Mr. Turner, and Mr. Cranston. Among these are magnificent examples of *Maréchal Niel*, *Gloire de Dijon*, *Cloth of Gold*, *Madame Falcot*, and *Madame Margottin*. The Rev. J. Dry's special prize for the best six Roses sent out in 1868-9-70 is taken by Mr. Turner with *Reine Blanche*, *Duke of Edinburgh*, *Henri Ledechaux*, *Montplaisir*, *Edward Morren*, and *Lord Napier*. Mr. Turner was also successful in winning the Oxford Rose Society's first prize for a collection of varieties sent out in 1867-8-9 or 1870, the second prize going to Mr. Cant. Mr. G. Prince's prize for the best twenty-four blooms of one variety, was awarded to Mr. Chard for *Souvenir d'un Ami*. The prize given by the Misses Turner for the best three blooms of any variety is taken by Mr. Cant with *Pierre Notting*, remarkably fine. Messrs. Lee exhibit, not for competition, a stand containing, besides beautiful blooms of *Maréchal Niel*, others of *Clemence Raoux*, very attractive by its peculiar colouring, as well as of *Edward Morren*.

MISCELLANEOUS.—Among miscellaneous collections of plants, that of Messrs. Veitch is especially noticeable, not only from the excellent effect of the arrangement, but still more from the value, rarity, and beauty of the plants of which it is composed. The *Nepenthes* suspended in front add much to the grace of the whole by their large pitchers. The plants forming this collection are so numerous that we can only specify a few of the most remarkable. These are *Begonia Cheloni*, *Sedum*, and *Veitchii*, the latter with large orange scarlet flowers, and the plant, moreover, is said to be hardy; *Dendrobium Bensonianum*, the new *Dracaena* which we have lately noticed, *Croton*, *Araucaria Rulei* and elegant *Maranta tubispachia*, a fine specimen of *Anthurium Scherzerianum*, *Dicffenbachia Bowmannii*, *Odontoglossum Laurenciaum*, *Lepidopteris superba*, and *Cypripedium Stouci*. For this collection the first prize was awarded.

The second prize was awarded to Mr. Williams, of Holloway, who had also a rich well-arranged collection, most conspicuous in which is the beautiful *Cochlostema Jacobianum*, beautiful pans of *Hymenophyllum demissum* and *Todea superba*, new *Dracaena*, the single leaf of *Begonia discolor*, *Cypripedium Stouci*, several *Palms*, and many interesting plants.

Messrs. Lee, of Baunsmersmith, have also a large collection consisting of *Heaths*, *Palms*, and several *Ferns*, among the latter of which are the handsome *Adiantum Sancte-Catherine*, *Adiantum lunulatum*, and *A. capillus-Veneris magnificum*, a fine variety and harder than *A. farleyense* to which it bears considerable resemblance. *Araucaria elegans* and *Rulei*, and the showy scarlet and black *Climacanthus Dampieri* are among the remainder. Mr. Ware, of Tottenham, also has an extra prize for one of his charming collections of hardy flowering and ornamental-leaved plants. Messrs. Hollison, of Tooting, have a third prize for a very effective group of *Palms*, new *Dracaenas*, *Pandanus*, *Ferns*, *Caladiums*, *Heaths*, and *Orchids*. *Chamaedorea gramineifolia* is a very handsome *Palm*, small specimens of which are very elegant for table decoration.

Mr. J. House, Eastgate Nursery, Peterborough, has an extra prize for a large collection of bedding plants in neat boxes, and very well grown. *Greenovia aurea* is particularly worthy of remark, and *Lobelia pumila grandiflora* is a very dwarf free-flowering kind, excellent for edgings, and forms a mass of blossom. *Iresine Lindenii* is likewise very effective. The *Alternantheras*, especially *amena*, are beautifully coloured.

The only group of wax flowers shown comes from Miss Sutton, of Thame, Oxon., and consists of well-executed *Roses*, *Dahlias*, *Fuchsias*, *Lilies*, &c. This receives a first prize, and a similar award was made to a very elegant group shown by Mr. John House, Church Street, Peterborough, the material used being muslin. An extra prize was also given for a case of skeletonised leaves from J. Kay, Esq., Bidsbury, an excellent example of skilful manipulation.

The best four pots of *Lilium auratum*, for which a special prize was offered by W. D. Cole, Esq., come from Mr. Turner, Slough, and have from twelve to sixteen fine blooms.

Lycopods are creditably shown by some exhibitors, but are not up to the mark of the London exhibitions. *Clematites*, on the other hand, as exhibited by Messrs. Jackman & Son, of Woking, are most excellent. Their first-prize four are *Mrs. Bateman*, *lanuginosa candida*, *rubella*, and *Jackmanni*; besides which they show several other kinds; the plants, grown in tubs, ranging from 5 to 6 feet in height from the ground, and literally covered with flowers. Some very good *Balsams* come from Messrs. Bull & Thorpe, and the same firm send the beautifully grown *Lobelias* shown at a recent meeting at South Kensington, and which they have since acquired. They also take an extra prize for bedding plants. Mr. Ware has a beautiful collection of hardy cut flowers; Mr. W. Paul boxes of *Roses*, *Zonal Pelargoniums*, *Erionymus daveceus*, one of the prettiest of golden-leaved shrubs, *Lilium auratum*, and several of his valuable new *Zonal Pelargoniums*, among which *Avantchey*, at once white-flowered and white-leaved, is not the least prominent. In the local classes are good blooms of *Hollyhocks* from Messrs. Sarman and Minchin, and of *Dahlias* from Mr. R. Parsons. *Fuchsias*, both in the local and general classes, are not remarkable either for size or beauty, nor have we seen them so this year. Mr. Cattell, of Westerham, had a first-class certificate for *Tropaeolum Minde* Warren, dwarf, with leaves having a very decided white variegation, but apparently of weak constitution—at least that was our impression. *Dracaena magnifica* from Messrs. Veitch, with leaves having the blade 15 inches long by 6 wide, is a plant that cannot fail to strike one by its rich reddish mahogany colour and free growth. Mr. Williams has also a very graceful *Horsetail*, *Equisetum sylvaticum*; and though *Horsetails* are not to be encouraged in a horticultural point of view, this one seems well worthy of attention. Mr. Williams also exhibits, not for competition, a magnificent specimen of *Cycas circinalis*, spreading about 12 feet, which is a great object of attraction.

Cut blooms of *Carnations*, usually not only numerously represented, but also very well done at these provincial shows, are well shown on this occasion also. In the nurserymen's class for twenty-four varieties, Mr. Charles Turner, Slough, is first with a very fine lot of blooms, consisting of *Dreadnought*, *Lord Lewisham*, *Lord Rencliffe*, *Oliver Goldsmith*, and *Prince Albert*. *Scarlet Bizarres*; *Anthony Dennis*, *Eccentric Jack*, *Graceless Tom*, *Captain Franklin*, *Rifleman*, and *Young Milton*, *Crimson Bizarres*; *Princess Royal* and *Twyford Perfection*, *Pink* and *Purple Bizarres*; *Colonel Windham*, *Squire Mey-*

nell, *Purple Flakes*; *Annihilator*, *Coronation*, Mr. Battersby, and *William Cowper*, *Scarlet Flakes*; and *James Merryweather*, *Aglaia*, *Flora's Garland*, *King John*, and *Rose of Stapleford*, *Rose Flakes*. Second, Mr. George Edward, York, with much smaller but nice flowers, the best being Mr. Patey, *James Merryweather*, and Mr. Walton, *Rose Flakes*; *Rainbow* and *John Davidson*, *Crimson Bizarres*; *George Edward*, *Scarlet Flake*; and *Mrs. Gunning*, and *Mayor of Nottingham*, *Purple Flakes*. Mr. H. Hooper, Bath, is third. In the amateurs class for twelve *Carnations*, Mr. S. C. Buttrum, Burgh Mills, Woodbridge, is first with a capital lot of flowers, consisting of *Lord Randolph* and *Sir J. Paxton*, *Crimson Bizarres*; *John Bright*, *Rainbow*, and *Tenby Rival*, *Crimson Bizarres*; *Hamiah* and *Sarah Payne*, *Pink* and *Purple Bizarres*; *Premier*, *Purple Flake*; *John Bayley* and *Marmion*, *Scarlet Flakes*; *Flora's Garland* and *Uncle Tom*, *Rose Flakes*. Second, Mr. N. Norman, Plumstead, with *Mayor of Nottingham*, *Purple Flake*; *Poor Tom*, *Rose Flake*; and the remainder seedlings, some of them appearing promising. Third, Mr. D. Pizzey, gardener to Sir C. E. Perry, Fulmer, Bucks.

The special prize offered by the Earl of Abingdon for twelve *Carnations* is also taken by Mr. Turner with a fine lot, consisting of *Lord Lewisham*, *Admiral Chazon*, and *Duke of York*, *Scarlet Bizarres*; *Eccentric Jack* and *Rifleman*, *Crimson Bizarres*; *Princess Royal*, *Pink* and *Purple Bizarre*; *Colonel Windham*, *Purple Flake*; *Sportsman* and Mr. Battersby, *Scarlet Flakes*; *Flora's Garland*, *King John*, and *James Merryweather*, *Rose Flakes*. Second, Mr. N. Norman, with a good lot of seedlings as before. Third, Mr. George Edward, York. Mr. C. Turner is also first in the nurserymen's class for twenty-four *Piotees*, and shows a remarkably fine lot of blooms that draw admiring exclamations from the visitors; they are *Chancellor*, *Colonel Clark*, *Exhibition*, *Lavinia*, *Lord Valentin*, *Mrs. Norman*, and *Miss Turner*, *Red-edge*; *Francis*, *Jessie*, *Mary*, *Mrs. Summers*, *Mrs. May*, and *Picco*, *Purple-edge*; *Elise*, *Lucey*, *Alfred Ingleton*, *Mrs. Rollings*, *Queen Victoria*, *Juliana*, *Obadiah*, and *Parity*, *Rose-edge*, and two seedlings. Second, Mr. George Edward, York. The best flowers in the stand are *Fairest of the Fair*, *George*, and *John Feather*, *Purple-edge*; *Lord Mayor of York*, and *Mrs. Hanford*, *Purple-edge*; *Hannah Maria* and *Harriet*, *Rose-edge*. Third, Messrs. Wood & Ingram, Huntingdon. With twelve blooms Mr. D. Pizzey is first with some good blooms, consisting of *Eliza*, *Rosetta*, and *Forester*, *Red-edge*; *Admiral*, *Francis*, *Gaiymede*, *Jessie*, *Margaret*, *Mary*, and *Mrs. May*, *purple-edge*; *Lucey* and *Princess Alice*, *Rose-edge*. Second, Mr. N. Norman, with *Mrs. Newball*, and *Prince of Wales*, *Red-edge*; *Jessie* and *Margaret*, *Purple-edge*, and the rest seedlings. Third, Mr. W. Broadbridge, gardener, to Sir C. Montaut, Bart., Warwick. The special prize for twelve blooms given by the Earl of Abingdon is also taken by Mr. Turner with a fine lot of blooms that are unnamed, though to all appearance repetitions of what have been previously given. Second, Mr. N. Norman. Third, Mr. T. Payne, Oxford. The *Carnations* and *Piotees* shown in the several classes for the same in connection with the Show of the Royal Oxfordshire Horticultural Society, are pretty good in quality, and consist mainly of flowers, the names of which have already been given. A first-class certificate was given to *Piotee Ne plus Ultra* from Mr. J. Payne, Oxford.

In the open class for twelve *Pinks*, Mr. G. Kirtland, Oxford, is first with pretty good flowers of the *Rev. Geo. Jeana*, *Annie*, *Brilliant*, *Mary Ann*, *Attraction*, *Blondin*, *President*, *Charles Turner*, *Bertram*, *John Ball*, *Victory*, and a seedling. Second, Mr. D. Gammie, Marston, Oxford, the best flowers being *Marion*, *Charles Turner*, and *John Ball*. Third, Mr. A. Evans, Oxford.

Cut *Verbenas* are finely shown by Mr. C. J. Perry, though the close and heated atmosphere of the tents tells severely on them. Mr. Perry is the only competitor for the special prize, offered by Mr. George Prince, for thirty-six kinds, having fine examples of *Nehala*, *James Birbeck*, *Madame Stenger*, *Champion*, *Rev. C. Peach* (new), *Carnation*, a new striped variety; *King of Lilies*, *Rose Imperial*, *Kate Lawden*, *Thomas Harris*, *Ada King*, *Geant des Batilles*, *Model*, *Leah*, *Mr. George Prince* (new), *Rising Sun*, *Annie*, *Rev. P. M. Smythe*, *Velocipede*, *Apollo*, *Black Prince*, *Lord Leigh*, *Fidelity*, *Thomas Lawden*, *Rev. J. Dix*, and *Magnificent*, as the leading varieties. There is no other competitor. With twelve trusses Mr. Perry is also first with *Edwin Day*, *Rev. C. Peach*, *James Birbeck*, *Rev. P. M. Smythe*, *Fidelity*, *Butterfly*, *Rising Sun*, *Mr. George Prince*, *Thomas Harris*, and unnamed seedlings. Second, Mr. H. Minchin, Hook Norton, the best being *Charm*, *Mrs. Pechin*, *Champion*, *Richard Dean*, *James Birbeck*, and *Geant des Batilles*. Of *Verbenas* in pots, the *Rev. R. H. Charsley* has the best, and takes the special prize offered by himself. The plants, which are of good size and pretty well bloomed, are in enormous pots. Some nice, but much smaller plants, come from Mr. H. Sarman, Witney; none of them are named. In the class for *Verbenas* in pots in the schedule of the Royal Oxfordshire Horticultural Society, the same exhibitors occupy similar positions. First-class certificates were awarded by the Floral Committee to *George Peabody* and *Grand Monarch* *Verbenas* from Mr. Eckford, Colchester, and to Mr. C. J. Perry for *Mrs. George Prince*, *John Laing*, *Perfection*, and *Rev. C. Peach*.

In the class for *Achimenes* in pots Mr. G. Hinton, gardener to the Mayor of Oxford, is first with good plants of *Dazzle*, *Dr. Hogg*, *Sir Treherne Thomas*, *Longiflora*, *Longiflora rosea*, and *Ambrose Verschaffelt*. Mr. W. Darley, the Gardens, Digswell, Welwyn, is second

with Dazzle, Grandis, Parsonsii, Sir T. Thomas, Margareta, and Manve Queen. Mr. Hinton is also first in the class for Achimenes in the schedule of the Oxfordshire Horticultural Society.

Some charming young but finely bloomed plants of Gloxinias are staged by Mr. Charles Turner in the class for six kinds. They consist of Glowworm and Henry Husson, erect-flowering kinds; and Rubens, Rose d'Amour, Count Benary, and Distinction, drooping kinds. Perhaps a better and more varied half-dozen could hardly be selected. Mr. W. Hickman, the Gardens, Blethingdon Park, Oxford, is second with Princess Beatrice, Sultan, Bridesmaid, and Nimrod, erect-flowering kinds; Queen Victoria, very pretty, and Princess Royal, with pendant flowers.

DINNER-TABLE FLORAL DECORATIONS.—A proverb will often throw a sunbeam of light over that which from a mere custom is becoming hazy and obscure. We are not at all prepared to sail with the stream in the present enthusiasm for dining-table decoration. We have a lingering belief that there should be a place for everything, and every one thing should be kept in its place. The office of a dining table is to present eatables and drinkables to the good people who sit around it. We have no desire to be barbarian enough to see a huge table loaded with a whole roasted ox, sheep, or pig; but at the risk of being considered old-fashioned, we like to see the joints of which we partake in the good old English style, instead of the slices on a plate, brought in the mode *à la Russe*, so much in vogue, which puts us in mind of the eating-house, instead of the home and the mansion. Attempt by presumed refinement to disguise it as you will, the natural principle remains, that it is most pleasant to partake of the little you want from a large, next-to-an-inexhaustible supply. When we have dined *à la Russe*, what we call next place to eating-house fashion, if we felt we could take another slice, we have been deterred by the thought that there might not be enough for others. When we see before us the round of beef, and the leg and shoulder of mutton, &c., we see there may be "cut and come again," and that we may have what we want without depriving others of their legitimate share. If a man is considerate at any time he ought to be so when he dines in company. Well, we are old-fashioned enough to like the old ways, and to inhale the fragrance of well-cooked meat and vegetables, as well as partake of them for our nourishment. In such a case we want no sickening aroma from flowers to mingle with the aroma from the joints. We have no objection to a few flowers and sprigs of vegetation to give a pleasing diversion to the eye, but as the object in sitting down at the table is to eat, these floral decorations on the old English system should never be rendered more lofty and conspicuous than the joints to be demolished. More latitude may be given on the *à la Russe* style, where the table may be at once furnished with the dessert and rendered somewhat ornamental with plants and cut flowers. The mischief is, that people forget that the dining-table, if it keeps its place, is a place to eat and drink at. All floral ornament and devices should, therefore, be of a very secondary instead of primary importance. We have read of an emperor long ago who had silver shoes for his horse, and a golden manger from which to eat his oats. Were the oats a whit better than if they had been taken from iron or wood? Is it a bit more truly refined to attempt to turn an eating-table into an aquarium, a fernery, or a neat conservatory? Everything in its place, gentlemen. When you dine, let dining be your object, and not the contemplation and study of floral display. A few men with wondrous minds can enter into the consideration of many things at once. We believe that the great masses can only thoroughly enter upon one subject at a time.

We like every one, however, to gratify his tastes, considering he has a perfect right to do so if he interferes not with the rights and pleasures of others. Even on the *à la Russe* plan, the ornamentation should never be so conspicuous as to lead the diner for a moment to forget he is at a dining table. A few Ferns in low vases, and cut flowers in low dishes, will generally tell the best, as not interfering with the reverse and free sight of the diners on each side of the table. For want of attention to keep floral decoration lowly and subordinate, we have seen pretty high glasses and vases of flowers on the dining table, that we wished could be transferred to side tables, or to the drawing-room, where, placed singly or in groups, they would become objects of attraction, more especially if the aroma was not overpowering. This latter observation would open up a large field of remark and observation. Our own opinion is, that in many cases the something like rage for cut flowers in rooms is furnishing more than is dreamed of—occupation for our medical friends. A growing plant with light in a window is a source of health to the inmates of that room. A plant, though green, set on a table, or in recesses where no direct light reaches it, is anything but a source of health to the human occupants. Cut flowers unrelieved with plenty of green, are always more injurious than beneficial in confined places, and especially at night. Did we consider the fitness and the place for things, we would have fewer plants and cut flowers where we could not give them light, and feel more pleasure in examining them under conditions more favourable to their health and our own.

Feeling power's to arrest the stream of floral decoration, but with some small hope, with the help of others, of so directing it in its course that it may not become a noxious extravagant mania, we will shortly notice a few of the matters of ornamentation that struck our attention at Oxford. And first of the three groups of flowers, or of flowers and fruit, suitable for the decoration of the dinner table, Class 96. Of the

three lots nothing is attempted with fruit, and hence all are on something like equal terms. Mr. Perkins, Lacomington, who takes the first prize, has a pair of low glass plates, each having a column of twisted glass supporting a smaller and rather shallower glass vessel or vase. The lower vases are nicely done with fine flowers of Allamanda, Roses, Pelargoniums, all rendered light and airy by dressings of Maiden-hair and the neat miniature flowers of a great beauty for this purpose, the Gypsophila repens. The upper vases or epergnes are draped with Maiden-hair and Fuchsias, and the flowers are equally well arranged. The centre of the three is a glass vase on a pedestal and base, raising the vase some 9 inches in height. This is dressed equal to the others, and in this vase a central column rises, terminating in a tube or trumpet-mouthed glass, with Fuchsias, &c., depending. From the centre of the lower vase rise three wide-mouthed tubes to about half the height of the central one, and furnished in a similar light and easy manner. Then, in combination with these, there are some thirteen glasses some 7 inches in height, and averaging an inch across at the top; these are dressed chiefly with Maiden-hair, some have a single Rose or had others a few choice flowers. Sitting at the table, the upper glasses of the three are above the line of vision, but are pleasant to look up to. Our chief objection to the central one is the three central tube glasses that rise about half the height of the central one. This would have enhanced its beauty as a separate article in the drawing-room or on a side table. Looked at merely as an ornament of the dining table, the centre vase is rendered more lumpy and less airy and graceful than its companions. We are just in great doubt whether, looking to fitness and appropriateness, these beautiful glasses, just filled as they are, would not have been as well without the columns and the upper epergnes. They would have been more simple.

Mr. Chard, Clarendon Park, Salisbury, is second with another simple arrangement, simpler even than the last, though the same remark will apply to the elevated epergne. This consists of three flat glass dishes resting on the table some 18 inches in diameter, with brass rods or columns supporting another shallow glass epergne some 10 inches in diameter. Two columns are festooned with climbing Fern, the central one with Cissampelos discolor. All these are dressed at the base with the common Male Fern. Two are filled chiefly with Roses, relieved with Maiden-hair and rather thickly studded with Grasses, the centre Grasses being some 15 inches long. A few Grasses give lightness, too many make a vase of flowers look common and poor. The common Fern dressings as a base are also rather long—some 15 inches beyond the glass, and therefore taking up considerable room. The central glass is similarly dressed, only is furnished with Allamandas, Begonias, and finer flowers. Here the height of the upper epergne leaves plenty of room for opposite guests to see and converse, and the Grasses from the fields make all look simple; and yet nevertheless, just as in the last case, we are in doubt if the upper epergne is an improvement.

The other exhibition, that of Mr. Spiers, of St. Giles's, Oxford, consists of three shallow glass epergnes, raised by base and pedestal a foot above the tablecloth. Each of these has a central column terminating in a wide-mouthed tube some 18 inches in height. From the base of this column rise three other columns rising about half the height of the central one, then circling over like a crooked horn, and terminating in a hook to hold each a little long glass basket. The three lower epergnes are based with the common Male Fern and the common Bracken, are then edged with leaves of Mrs. Pollock Pelargonium, and a variety of flowers used for grouping upper and lower epergnes and the suspended baskets. Looked at individually on a side table each of these would be interesting; as adjuncts to the dining table, the triple columns and the hanging baskets make them heavy.

In Class 97, Hand Bouquets, one pretty vase is shown by Mr. Hense, of Peterborough, but not entered, edged with Maiden-hair, and nicely blended with Stephanotis, Crassulas, Mar. ch. Niel Rose, and Pelargoniums. It wanted relief at the centre. That exhibited by Mr. Perkins is very pretty. Edged with lace paper, a Maiden-hair; filled with a nice mixture of small Roses, Pinks, Carnations, scarlet and light Pelargoniums, relieved with dots of Maiden-hair, other little green bits, and dots of Forget-me-not. Mr. Earley, of Digswell, Welwyn, exhibits a very graceful and airy bouquet, the best flowers lightly relieved by Maiden-hair Fern and small Grasses. Mr. Hill exhibits a nice arrangement, relieved with sprigs of Maiden-hair. Mr. Chard, of Clarendon Park, has a very simple arrangement: some good flowers, as Heaths and Clerodendrons, being rather too much relieved, though made light and airy, with Grasses and Ferns.

The prize offered by the *Journal of Horticulture* for the best dessert of fruits combining excellence of quality with taste in arrangement, has failed even more than hitherto in securing the object aimed at. There is not the slightest attempt made at taste in arrangement. I had hoped to have learned a lesson here, and so far have had my journey for nothing. I dearly wished to open up the question of dressing fruit with flowers, &c., but here there was not the vestige of a chance. There was a great deal of fruit altogether, but nothing above the usual average. Some six or seven Queen Pines; four of Grapes Black and White, retaining the traces of sulphur or dirty water; two of Nectarines, Violette Hative and Pittmaston Orange, the former fair; three of Peaches, one dish at least rotten and gone; two of Strawberries, good but for retaining traces of the packing; two of Cherries, fair; a good Melon, Prizefighter; and a plateful of the small Royal Ascot Melon, and very small Turkey Figs. I give every credit to

the proprietors of the *Journal of Horticulture* for their kindness and their wish to advance horticulture and the best interests of horticulturalists, but I think they had better give up giving such a large reward for a single exhibition. The successful exhibitor is Mr. Miller, gardener, Workshop Manor.

The *Gardeners' Chronicle* is more fortunate than the *Journal of Horticulture* in this respect. There was a keen competition, and very good things were exhibited. The first prize for the best six kinds at least of fruit and vegetables, was taken by Mr. G. T. Miles, gardener to Lord Carrington, Wycombe Abbey, Bucks. The collection consists of a beautiful dish of Barrington Peach, three bunches of Buckland Sweetwater Grape, bunches not large but beautifully yellow-coloured; one fine Queen Pine, one Scarlet Gem Melon, a dish of Downton Nectarine, and one of blue Plums. The vegetables are equally good, consisting of long, crisp French Beans, Asparagus, fine for July; Globe Artichokes, flat Tripoli Onions, fine; Broad Wonderful Bean, and Myatt's Prolific Potato, very fine. The second prize was awarded to Mr. Simpson, gardener to Lord Wharcliffe. In this collection were two nice Queen Pines, two Melons, incomparable and Queen Emma; two dishes of Peaches, and one of Nectarines, rather small; three bunches of Black and three of White Muscat Grapes, not ripe; one dish of Dr. Hogg Strawberry, one of White Cherry, and one of Brown Turkey Fig, good. The vegetables consist of French Beans, Carrots, Onions; Peas, No Plus Ultra, Premier; Kidney Potatoes, &c. There were also some nice fruit and vegetables in Mr. Challis's and Mr. Keen's collections.

FRUIT.

Fruit is tolerably well represented, the Grapes coming well to the front, and proving by far the most attractive feature of the Show, and of these we would particularly notice the very meritorious collection of Grapes from Mr. Speed, Chatsworth, which are specially interesting and remarkable (these are not entered for competition). They are the produce of Vines thirty-seven years old, which had been rejuvenised, as stated, by adopting the extension system of pruning. The examples are as follows:—Black Hamburgh, the bunches large, about 3 lbs., perfect in bunch and berry; Black Prince, fine large bunches, beautifully coloured, and excellent; Mill Hill Hamburgh, with very large berries, and altogether splendid.

For the prize offered by Professor Lawson, of Oxford, for six varieties of Grapes, the second and third by S. Davis, Esq., and Mr. Sheriff Hauley, the competition is very spirited, Mr. Turner, of the Royal Nurseries, Slough, being awarded the first prize very worthily for very excellent examples of Royal Ascot, Alicante scarcely coloured, Black Prince, Black Hamburgh, Buckland Sweetwater, and Muscat of Alexandria, the second being awarded to Messrs. Lane, Berkhampstead, for nearly equally fine examples of Golden Champion, large in bunch and berry, but quite unripe; Buckland Sweetwater, Foster's White Seedling, Black Prince, and Black Hamburgh. Mr. Wallis, gardener to J. Dixon, Esq., Aske Park, Congleton, is awarded the third prize for fair examples of Black Hamburgh, Mill Hill Hamburgh, Black Prince, Royal Vineyard, and Black Frontigann. Mr. W. Colegrave, gardener to S. Davis, Esq., Swoiford Park, Ennetone, and Mr. Broadbridge, gardener to Sir C. Mordaunt, Bart., Walton House, Warwick, also exhibit.

In the class for six distinct dishes of fruit, offered by the Local Prize Fund, there are five competitors. Mr. Miles, gardener to Lord Carrington, is awarded the first prize for Stillward's Sweetwater Grapes, magnificent examples of Galande Peaches, small Queen Pine, Elruge Nectarine, Elton Cherries, and a very poor dish of Strawberries. Mr. Broadbridge is placed second with a very fine dish of Muscat of Alexandria and Black Hamburgh Grapes, good Grosse Mignonne Peaches (named Barrington), fine Elruge Nectarines, small Moscow Queen, and a very poor Treantham Hybrid Melon. Mr. J. Wallis, gardener to J. Dixon, Esq., Aske Park, is awarded the third prize, who exhibits magnificent examples of Barrington Peaches, good Nectarines, fine Cherries, and Black Hamburgh Grapes, the Pine Apple here being the weak point. Mr. Harwood, gardener to E. Greaves, Esq., M.P., Avonside, Warwick, and Mr. Clark, gardener to Earl Cowper, Brocket Hall, also exhibit.

In Class 60, collection of fruit, twelve dishes, there was no competition, the only exhibitor being Mr. W. Clark, gardener to Earl Cowper, Brocket Hall, who was awarded the first prize. His exhibition consisted of two fair Queen Pine Apples, Bowood Muscat Grapes quite green, and Black Hamburgh ditto poor in colour, very fine Galande and Grosse Mignonne Peaches, Hunt's Tawny and Elruge Nectarines, Early White Figs, a good Melon, Apricots, and a dish of Bigarreau Napoleon Cherries.

In Class 63, single dish of Black Grapes, there was a very excellent competition. Mr. W. Coleman, gardener to Earl Somers, Easton Castle, Ludbury, Hereford, who exhibits magnificent examples of Black Hamburgh, the bunches weighing over 4 lbs., perfect in bunch and berry. These are the finest examples in the Exhibition, and are awarded the first prize. Mr. Smith, gardener, Exton Park, Oakham, is placed second with smaller but very fine examples of the same; and Mr. C. Turner, Slough, the third, with small bunches, but well-finished examples of the same variety. Mr. J. Ratty, gardener to J. Scholfield, Esq., Turville Park, Henley-on-Thames, stages good examples of Black Prince. Mr. Colegrave also exhibits.

In Class 64, three dishes of Muscats, the competition was also good. The first prize is awarded to Mr. J. Thomas, gardener to Mrs. T. Drake

Bignell, Bicoster, who shows splendid examples of Muscat beautifully ripened, and very perfect in every respect; Mr. Turner, of Slough, being placed second with nearly equally good examples of the same, but scarcely so good in colour; Mr. Janson, gardener to T. Statter, Esq., Stand Hall, Manchester, is awarded the third prize for very good examples of the same. Mr. W. Colegrave exhibits also fine examples of Buckland Sweetwater, large in bunch and berry.

In Class 65, baskets of 12 lbs. of Grapes, a very good competition takes place. Mr. Coleman is placed first with fine examples of Black Hamburgh; and Mr. Thomas, second, with good Muscats. Mr. Smith, gardener to H. Walker, Esq., Calderstone, Liverpool, with Black Hamburgh; and Mr. Standish, The Royal Nurseries, Ascot, with Royal Ascot, are placed equal third with really excellent examples. Mr. Ward, gardener to T. N. Miller, Esq., Bishop's Stortford, exhibited a most magnificent basket of Gros Colman, with berries of enormous size, and of truly beautiful appearance, to which an extra prize was awarded. These were extremely meritorious. For appearance this Grape surpasses all, but in flavour is very inferior. Mr. Smith, gardener, Exton Park, exhibits a fine lot of a Black Hamburgh; and Mr. Janson has also an excellent basket of Black Hamburgh and Canon Hall Muscat. Mr. Broadbridge, gardener to Sir C. Mordaunt, and Mr. C. Turner also exhibit.

In Class 61, three Pine Apples, the competition is very good, seven lots being staged. Mr. Paten, gardener to H. S. Lacey, Esq., Charlotte Park, Warwick, is placed first with three handsome, well-coloured fruits of two Moscow Queens and a Smooth Cayenne, the second prize being awarded to Mr. C. Allen, gardener to J. Clegg, Esq., Withington Hall, Cheshire, with three handsome Providence, very even in size, and well finished-off, Mr. Gardiner, of Eaton Park, coming in third with two very even Moscow Queens, and a very good Providence. Mr. G. Ward is third with Charlotte Rothschild, 7 lbs. 10 oz., and a Smooth Cayenne, 7 lbs. These are rather over-ripe. For single Pine Apples, the first prize was again awarded to Mr. Paten, for a well-ripened Enville Queen with a number of crowns, weighing 8 lbs. 14 oz. The second prize went to Mr. Gardiner, and the third to Mr. Ward.

In Class 66, Peaches, single dish, Mr. J. Wallis, Aske Park, is placed first with very excellent examples of Barrington. Mr. Miles, second with the same; and Mr. Sage, gardener to Lord Brownlow, third with Bellegarde. Mr. Ratty, gardener, Turville Park, showed excellent examples of Galande.

Nectarines are not well represented, excepting in the prize lots. The first prize went to Mr. H. Take, gardener to R. Nicholls, Esq., Brunley, Leeds, for good Violette Hative; and Mr. Miller, Workshop Manor, was second for the same; Mr. James, gardener to the Duke of Newcastle, is third. Good examples of Hunt's Tawny are shown by Mr. Turner, and Elruge by Mr. J. Day, gardener to A. Seymour, Esq., Norton Hall, Daventry.

Apricots are but poorly shown; Mr. Smith, gardener to the Earl of Gainsborough, being placed first with Blenheim, and Mr. Earley second with Moorpark.

In Figs, the first prize is very deservedly awarded to Mr. Sage, gardener, Ashridge Park, for finely-ripened Brown Turkey; the second to Mr. Harvey, gardener to P. Wroughton, Esq., Woolley Park, Wantage, for the same; and the third to Mr. J. Day for Marseilles.

In Cherries there is a good display; Mr. Turner, of Slough, being placed first with Bigareaux, and Mr. J. J. Chater, Gonville Nurseries, Cambridge, second with the same; third to Mr. Smith, Exton.

Strawberries, six dishes—there is only one exhibition, by Mr. D. T. Irvine, gardener to the Duke of Hamilton, Easton Park, Wickham Market, who is awarded the first prize for Crimson Queen, Nimrod, Frogmore Late Pine, Sir C. Napier, Myatt's Surprise, British Queen.

Strawberries, single dish. The first prize is awarded to Mr. Maunder, gardener to the Earl of Abingdon, Wytham Abbey, Berks, for excellent Eleanor; the second to Mr. T. Blome, Rhug Gardens, Corwen, for British Queen, very good.

In the classes for Melons there is, as usual, a strong competition. In the class for green-fleshed, twenty-four varieties being staged, the first prize is awarded to Mr. Gardiner, of Eaton Park, for Golden Perfection, the second to Mr. James, gardener to the Duke of Leinster, Carton, Maynooth, and the third to Mr. D. T. Fish for a green-fleshed variety, named Turner's Scarlet-fleshed. In Scarlet-fleshed the first prize is awarded to Mr. Bailey for Royal Ascot, the second to Mr. Carmichael, Sandringham, and the third to Mr. Earley.

Plums are poorly shown. Mr. Miles, gardener to Lord Carrington, is first with Kirke's, Mr. Janson second with the Peach, and Mr. Lockie third with July Green Gage.

Out-door fruits, four dishes. Two equal first prizes are awarded to Mr. Turner, of Slough, for very excellent Frogmore Late Pine Strawberries, large Early Apricots, Black and White Cherries; and to Mr. T. S. Irvine, gardener to the Duke of Hamilton, for well-kept Northern Greening Apples, Black Circassian Cherries, British Queen Strawberries, and Black Currants.

In Class 111, prizes offered by H. M. Gammon, Esq., for three varieties of Vines in pots, Messrs. Lane & Son, of Berkhampstead are the only competitors. They exhibit three very large plants in pots 10 inches in diameter, profusely laden with fruit, which is, however, of not much merit. The varieties are Foster's White Seedling, Black Hamburgh, and Royal Ascot. The first prize was awarded.

In Class 112, six orchard-house trees in pots: the prizes offered

by the Baroness Wenman, H. Wykeham, Esq., and H. C. Tawney, Esq., Messrs. Lane again had the field to themselves, and were awarded the first prize for very fair examples of a Peach and Nectarine, Apple and Pear, Plum and Cherry. The exhibition here is, however, by no means so good as we could have expected. Vegetables will be noticed next week.

FRUIT COMMITTEE, July 20th.—G. F. Wilson, Esq., F.R.S., in the chair. Messrs. Standish & Co., of Ascot, sent a seedling Grape called Citreulle Muscat, in appearance much like Chasselas Musque, and much resembling it in flavour. The Committee requested that it should be sent again later in the season. Mr. Eckford, gardener to the Earl of Radnor, Coleshill, again sent his seedling Grape, named Coleshill White Hamburg, which too closely resembles the old White Tokay, to be of any value as a new variety. From Mr. Anderson, gardener to the Earl of Stair, Oxenford Castle, came a seedling Strawberry, named Moffatt's Duke of Edinburgh, raised from Keen's Seedling, crossed with Elton Pine. Fruit very large and extremely handsome, but very deficient in flavour. Mr. T. Elcome, Rhug Gardens, Corwen, sent a seedling Strawberry named Owen Glendower, but of no merit. Mr. Gilbert, Brnleigh Park, sent a seedling Cherry, raised at Brnleigh more than thirty years ago. It was somewhat in appearance like Bigarreau Napoleon, but more acid. It received a first-class certificate. Mr. Smith, gardener to the Earl of Gainsborough, sent some Scarlet Gem Melons, stated to have been grown in the open air. Mr. G. Lee, Clevedon, Somerset, sent Lee's Prolific Black Currant, which had before received a certificate.

EXTRACTS FROM THE REPORT ON THE BRISBANE BOTANIC GARDENS.

ENCOURAGED by the great success of the growth of the Palms and the Cycads made in the compartment of ground set apart for them near the aviary, and the great interest taken in them, a new plantation has been formed adjacent to the residence of the Director, and many of these graceful and highly useful trees have already attained to dimensions of considerable importance; they consist of the Cocoa Nut (*Cocos nucifera*), the African Oil Palm (*Elaia guineensis*), the Date Palm (*Phoenix dactylifera*), the Wine Palm (*Caryota urens*), the Cabbage Palm (*Oreodoxa regia*), the Sago Palm (*Sagis Rumphii*), the Sago Palm of Queensland (*Sagis Blackalli*), the Wax Palm (*Ceroxylon andicola*), the Betel Nut (*Areca catechu*), &c.

Of the fibrous plants the Clivia Grass-cloth plant (*Bahmeria nivea*), still continues to thrive exceedingly well, but though many have essayed to prepare it for manufacturing purposes, all have most signally failed. It has been experimented on by those who have spared no pains, and on every occasion with similar results. The remaining fibrous plants consisting of the Jute (*Corchorus capsularis*), the Sun Hemp (*Crotalaria juncea*), the Queensland Hemp (*Sida retusa*), &c., are thriving, and gradually gaining favour among those interested in the cultivation of what may yet become a new and important branch of industry. The Cotton Plant was doing extremely well up to the late rains, which, however, have severely checked its development. Some five or six varieties have been furnished to this department, during the six months, for experimental purposes, and are now bearing; one or two of these varieties promise to prove an acquisition to Queensland planters.

Of the dye plants the Indigofera tinctoria (Indigo), the Rubia tinctorum (Madder), the Lawsonia inermis (Henna plant), and the Cochineal insect, &c., still continue to prove their adaptability for successful cultivation in Queensland.

THE STAPLEHURST ROLLER BARROW.

ALL who have grass lawns, and flower beds around them or in these, know full well how very inconvenient it is to go to work on them with a barrow, especially after wet; the wheel makes such marks in the grass that the work seems almost useless. I have lately seen a very ingenious contrivance brought out by Messrs. Pollard, Urquhart, & Co., of Bear Garden, Southwark, entitled the roller barrow; it is made of iron, and there is no wheel, but in lieu of it there is a broad roller, which, instead of making marks and spoiling the grass, really improves it, and, of course, the fuller the barrow the better is the result produced. It is exceedingly light, can be moved by a boy, and is, I think, a contrivance well worthy of attention by all those who pride themselves upon the condition of their grass; it will also save the tearing-up of walks by the wheel, barrow in wet weather. With care it is likely to last a lifetime.

and thus again has an advantage over the old wooden barrow—D., Deal.

[We conclude that the Staplehurst barrow is the same as that described as follows in the *English Mechanic and Mirror of Science*. "The peculiarity of this ingenious invention is, that it causes no unsightly scores or marks upon lawns or walks in wet weather, when the use of the ordinary wheelbarrow is a source of constant disfigurement. It is easily worked by a boy, though it can be rendered of any weight desired by filling it up with ballast, the load being discharged at once by tipping the

handle. It is very serviceable for bedding-out plants, carrying away cut grass or turf, gathering up leaves, or when manuring the ground. The roller barrow is equally adapted for grass lands where horses and carts cannot be employed, and for croquet lawns, being always sufficiently light to be managed in case of need by a lady. It is in use at the Crystal Palace, Kensington, and other gardens, where its handy qualities have rendered it a permanent favourite."

Another combination is of the roller and watering engine, made by Mr. J. Dove, 17, Exmouth Street, Clekenwell.

The advantages of this neat little garden machine may be seen in not only throwing water a distance of about 60 feet, but of watering and rolling grass or gravel walks at the same time, so that while two wheels would in either case be injurious, this roller absolutely does good, and is so portable that any ordinary domestic may use it.—Eus.]

STANDARD ROSES.

THERE is a trifling art or secret in the budding and preservation of standard Roses, perhaps not observed and practised by our roarians generally. I refer to the need of one good bud at least on each side of the standard, not opposite exactly, but 1½ or 2 inches distant, betwixt the buds on opposite sides, to form somewhat equal heads and flower shoots. And I allude to the necessity of a clean-cut or eawn standard apex or point, not more than 1 inch beyond the highest bud, and protected by a cap of grafting wax or pitch (a thin patch), to preserve the core of the standard from decay, and the wood of the standard from dying down to the buds, and the decay thus reaching and destroying the buds also. Long standard remnants above the buds carelessly cut admit the air and frost into the cavity of the decayed core, like a mown Thistle stem, and hence our standard Roses perish. I say protect the ends by capsules of wax, pitch, or tar for preservation.—Reader.

LAWN MOWERS.

HAVING read the letter of "Vitis" on the subject of the Archimedean mower, I write to give you my opinion on the value of the machine. I have at present a 30-inch machine of Green's, and a 15-inch one made by Kennan of Dublin. The two are equally good. I purchased this year a 14-inch Archimedean, and the result is that I find one man or well-grown lad can work it with greater ease than a man and boy can work

Kennan's, which is much the same as Green's. It does not do such perfect work as either of the others, but the ribbing is so regular that it is not unsightly; it has rather a quaint appearance when seen in a strong light, that is all. It is much more liable to notch than the others if it meets a stone, but stones ought to be cleared off for any machine.

I never sweep after the Archimedeon, and have taken a hint from it, as I now have taken off the box from my other machines, and allow the grass to scatter. This is practically no eyesore, as the grass is not seen after a few hours, and, if too much gets collected on one spot, it is easily scattered with a broom.

Another great advantage the American mower has—it will cut the grass when it is wet. I have no experience as to whether it will cut long grass.—A SUBSCRIBER, *Co. Clare*.

NOTES AND GLEANINGS.

A NATURAL HISTORY ASSOCIATION has been established at NATAL. Besides many successful researches in ornithology and entomology, our contemporary *Nature* notices that in botany the Association reports a new climbing Scrophulariaceous plant, *Buttonia natalensis*, discovered by Mr. E. Button, and of a new Date Palm, detected by Mr. McKen, Curator of the Natal Botanic Gardens. The colony may be congratulated on possessing so energetic a Society.

WORK FOR THE WEEK.

KITCHEN GARDEN.

As we have been favoured with rain at last, and as there is some probability of its being general, I cannot do better than urge the importance of attending at once to those crops of the kitchen garden which must constitute the chief supply for the coming winter and spring. Planting out *Celery* in its various stages, *Broccoli*, *Cauliflowers*, *Brussels Sprouts*, *Savoye*, *Kale*, and many other useful vegetables, should be a matter of frequent occurrence. The ground from which early Peas, early Potatoes, early Beans, Winter Spinach, &c., have been cleared will come in for this purpose. Exhausted plots of Strawberries, too, after the fruit is gathered, will be excellent as a change for the better Broccoli and Cauliflowers. Deep digging and heavy manuring must be resorted to in all these cases, more especially for the *Celery*, which cannot be produced of a tender and crisp character, if lacking manure and moisture. Keep the succession beds of Horn Carrots thinned in due time. A considerable breadth of *Endive* should be planted out without delay; in fact, one-half of the crop. High manuring is absolutely necessary to produce this valuable salad in perfection. In planting succeeding crops, keep raising the beds higher as the season declines. Let a good breadth of ground be duly prepared for *Winter Spinach* forthwith, by thoroughly trenching and burying a good coat of half-rotten manure in the bottom. It generally succeeds best in highly-raised beds, stagnation being its chief enemy. An autumn *Mushroom* bed should now be made. Throw the dung together to ferment for a few days; when half dry mix one-third of loamy soil with it to keep in check any further fermentation, and tread or beat hard whilst building the bed, making the spawn holes immediately the bed is finished, to assist in keeping down the heat. Strawberry runners should be procured for new plantations without delay. Those who cannot spare ground for a new plantation may prick them out in prepared beds about 6 inches apart, and remove them with balls in October or the early part of February.

FLOWER GARDEN.

No flower is more popular or more useful than the Rose, whether as standards by the sides of promenades, in beds or masses, festooned about pillars, or enlivening the conservatory in the depth of winter. For all these purposes Roses demand a considerable share of attention, especially at this period. Budding, cutting-striking, final potting, &c., are processes of paramount importance at the present moment. The Hybrid Perpetuals, Teas, Bourbons, and Chinas are the most eligible classes from which to select kinds for pot culture. The following are good old kinds for a winter collection on account of their general utility:—Devoniensis, Cramoisis Supérieure, La Pactole, Caroline, Elise Sauvage, Comte d'Eu, Coupe d'Hébé, Prince d'Estéshazy, William Jesse, Princess Maria, Clara Sylvain, Anhernon, La Reine, Madame Laffay, Duchess of Sutherland, Earl Talbot, Belle de Florence, Bourbon Queen, and Crimson Perpetual. The Persian Yellow and Harrisoni have also been

found to force tolerably well. Proceed with Rose-budding without delay. Keep down all suckers, and clear the stems of wild shoots. See that all hips are cut away from those which blossomed early; these exhaust the plants much. Strong shoots of Chrysanthemums may now be layered in pots to produce dwarf and compact bushes. Those in pots may soon receive their final shift. The layering of Carnations and Picotees must be proceeded with as rapidly as possible, it being a point of great importance to have the plants well rooted and established before placing them in their winter quarters. More of the next year's success, as to fine, healthy growth, &c., depends on attention to this matter than many people are aware of. All seedling plants should be marked and layered, noting their various properties as to form, colour, texture, pod, &c. Should any seedling, otherwise fine, have serrated petals, it will be advisable to propagate it, as growing it in another situation may, to a certain degree, rectify this defect, for some of our best varieties will come occasionally, when poorly grown, very rough on the edge. As the blooms decay, extract the faded petals. Amongst the best old flowers are Matthew's Enchantress, purple Picotee; Fletcher's Ne plus Ultra, light purple; Barringer's Unique, red Picotee; Galliff's Proconsul, a very fine heavy-edged rose Picotee of extra form and substance; and Eason's Admiral Curzon, scarlet bizarre Carnation. Plant out rooted cuttings of Pinks on beds of well-prepared soil, but not too rich. A second crop of pipings may also be inserted where an increase of stock is required. Seed may also be gathered, retaining rather long stalks; tie half a dozen together, and allow them to dry well, after which the heads or pods of seed may be put in small paper bags, which may be fastened round the stems and then hung up in a dry, airy situation till wanted. Seedling *Auriculas* which had been put out in pans or boxes in spring will now have attained a considerable size; they may be potted in pint pots (singly) in equal parts of good sound loam and leaf mould, and placed in the shade.

GREENHOUSE AND CONSERVATORY.

The pot Roses intended to flower in the conservatory late in the autumn should now receive whatever pruning is necessary. All those which require a shift should have it forthwith, in order that they may have their pots full of healthy roots by the flowering period; this, and the application of liquid manure, together with a sweet and mild atmosphere, will perform wonders. After these operations they should be placed in some open and airy spot, and if plunged in ashes they should be frequently turned, or the interior of the pot will be without fibrous roots. Give them regular waterings, and persist in picking off all blossom buds as they appear from those required to blossom in November and December. Let the *Camellia* buds have a thinning as soon as possible. Look out and encourage a lot of good things for a late autumn display. *Fuchsias* and *Achimenes* in succession, and even choice *Verbenas* in somewhat thick masses in wide-mouthed pots, will add to the general effect. Remember that all those plants required to blossom in midwinter must have their final shift betimes. There is no success in forcing, or even retarding, without a plentiful of roots.

STOVE.

Stove plants in general have made a good growth; the next point is to have the growth matured. To this end give a still freer circulation of air, and avoid shading as much as possible. The propriety of a second house for Orchids will be more readily seen at this period than, perhaps, any other. The early-growing kinds, several of which are winter or early-spring bloomers, will now require the withdrawal of a portion of the atmospheric moisture still necessary to many others. Several of them, such as the *Cattleyas*, might be removed to a vinery were it not for the attack of snails and slugs. In cases where the whole stock must be grown in one house, it is advisable to keep a free circulation of air by day at this period, and even all night; if possible, endeavour to have a good source of atmospheric moisture in the latter half of the day, and dispense with shading as much as possible.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

Dry as ever, but we never had better Lettuces for all the heat, and that chiefly owing to sowing them, and thinning and mulebing. The roots catered for themselves. Transplanting Lettuces without watering and shading in such weather would

be merely labour thrown away. Mashed Peas, Beans, Cauliflowers, &c., with anything and everything we could get hold of, and it is wonderful how the mulching tells in relieving the roots and enabling them to pump up moisture to meet the demands of the sun on the large foliage. All in all, we have never had better Cauliflower, but it has given us extra trouble and labour. Again, never had we better Ashleaved Kidney Potatoes, and never earlier out of doors, and yet the soil about them and around them was as dry as dust. Later kinds, however, are not doing so well, some of them are tubering slowly. Even Early Shaws, pretty early, and generally a great bearer, is far from equalling the Kidneys. Myatt's Ashleaf is perhaps the best for forcing, but the Prolicof others is fine for out-door work. We attribute the great yield in our case partly to a dressing of lime which the ground had not received for many years. This helped to decompose more rapidly the organic matter in the soil, and helped also to make the soil a better retainer and absorber of moisture, however obtained. We fear, if this dryness continues, the haulm of the late kinds will wither before the tubers ripen. The dryness has forced us to make some planting depend on our ability to give a watering when first turned out. Those moved with balls hold their own pretty well; those turned out with the dibber hung their heads unless they had moisture at the roots.

We were pleased to notice the communication of Mr. Castle, at page 11, on *no watering*. Our attention has been directed to it by several amateur correspondents, who say they are in a perfect maze between our little and peculiar watering at the roots beneath, and keeping the surface as much as possible dry, and Mr. Castle's no watering at all. In our circumstances, even at bedding-out time, and watering our plants in beds and trenches previously, and lifting the plants with balls well moistened, and planting them at once in the moistest soil, we could not have done without a little watering to settle the roots, and encourage them to progress, because our soil was in general so dry, and we only secured a little moisture beneath by keeping the soil there, and not bringing it to the surface. The great key to the difference between our treatment and that of Mr. Castle, and both we presume successful, is to be found in the statement, page 11—"Between March and May we have much cold weather." The plants being, therefore, well watered as often recommended beforehand, the roots have a comparatively moist soil to go into, and, therefore, need but little watering, though a little given at the roots, and not a surface dressing, would have done in our opinion no harm, but some good as preventing anything like a check. We are quite as much opposed as Mr. Castle to every-day watering. We know that in many circumstances the cold thus produced by rapid evaporation cools the roots of the plant, but that is not owing to the water in these circumstances being colder than the soil immediately round the roots, unless trouble has been taken to turn down subsoils, or in other words the heated soil of the surface, for water fully exposed will generally be found little or no colder than the soil within 4 or 6 inches of the surface, unless that has been artificially heated by the turning-down mode just referred to, and that plan, however good in general, we could not practise this year, as if we had done so, the soil to the depth of the turning would have been like so much ashes taken from under a grate. It is the rapid evaporation from the surface that cools the soil; but, then, that is avoided when the watering is so given as to leave a dry surface. We have stated how dry some of our dug soil was to the depth of 2 feet. The other day men were making holes for the posts of a new fence in a meadow, and to the depth of 16 inches the soil was perfectly dry, notwithstanding that the surface was covered with rough herbage. Farther down you could first find traces of moisture, and then enough of it for anything. Now to plant with even moistened balls, and still more with a dibber, in such thoroughly-dried ground would just be labour thrown away. Circumstances thus entirely alter the treatment that should be given. Where there has been plenty of wet weather up to May, planting out in the end of May may be done very differently to what would be required in cases where there has scarcely been a good rain since the beginning of the year. In general, too, on the west coast the atmosphere is more charged with vapour, and there are more passing and frequent showers than in the midland and eastern counties of the island. It used to be said there was scarcely a day without a shower in some parts of the west of Scotland. As the heat and drought of the summer progressed we found a little water at the roots, still more essential at all fresh plantings and sowings. After the very hot days, had we the water we would have been

tempted to have given some of the tenderest things a skiff from the syringe or garden engine, just to refresh the foliage, as what little fell on the heated soil would be quickly raised in vapour, and thus help to give what Nature had refused to give for weeks—a gentle dew. For a couple of months we have rarely had anything worthy of the name of a dewy morning. In the moistest bit of ground we had we turned out strong Cauliflower plants with large balls, and though we shaded them a little, we soon found we would have heads like buttons and spiquing tops if we could not have watered with even dirty water. Personally we feel obliged to Mr. Castle for his pithy article. Extremes often meet. The frequent or every-day watering of plants in the open ground may be led to see that there may be too much of a good thing. The advocate of "no watering" may come to the conclusion that "once watering," or even "judicious watering," does not involve "always watering," and those who are now somewhat bewildered by differences of opinion, may see daylight through their difficulties by remembering that different circumstances as to soil and climate require some difference in management. We have no doubt whatever that many of our friends with water at full command water their plants into disease and dissolution.

Mushrooms—"Anxious," fond of Mushrooms, but hitherto unsuccessful, with a low close shed 18 feet long and 11 feet wide, and having about a bushel and a half of horse droppings every day, with about as much of littery straw, wants to know how to get the most Mushrooms most easily. In such a case, as the beds are to be on the floor, we would divide our space into four equal parts, with a walk of 2 feet or 30 inches down the centre. This would give room for four beds 9 feet long and rather more than 4 feet in width. Our shallowest beds we would have about 12 inches deep in front, and from 15 to 18 inches deep at back. For winter work we would have them a little deeper, and depend on surface covering to keep up the necessary heat. Now, there are many ways of making such beds. We will put ourselves just in the position of "Anxious," and advise him to do as we have frequently done. Collect the droppings with nearly an equal portion of short litter for a week or ten days, and lay them in any place not too thickly, where no rain will fall on them. Then add a barrowload or two of dry soil, mix all together, and make this the base of the 9-foot bed. Beat it firmly together, and it will heat very moderately. Then every second day add the droppings, and the same amount of short, dryish litter all over, tread or beat, and then put a little dry soil over. Continue the process until the necessary height is secured, as referred to above, for the different seasons. By this plan, as will be perceived, the bed will never become very hot, and the bulk of the manure will be fresh—full of nitrogenous matter—and, therefore, capable of carrying a heavy crop of Mushrooms. We have tried many modes, and successfully too, but never one with more success than the above, and it is peculiarly applicable where a bushel or so of droppings can be obtained every day. The success will greatly depend on preventing overheating by the frequent beating and the adding of a little dry earth. Street sweepings or road scrapings when dry are admirable for this purpose. People are slow to learn that fermenting material, as dung, will heat mildly and keep up the heat long in proportion as it is so consolidated as to keep out air, or rather prevent its free entrance. By such a mode the manure is not exhausted as it often is when thrown into a heap and allowed to ferment freely.

If we had the droppings of a single horse and had leisure, the above is the mode we would adopt. Why do you not adopt it now? Just because we could not easily get the droppings regularly, and amidst the multiplicity of matters demanding attention we should not be able to attend to Mushroom-bed-making every day or every other day. Those who try the plan, however, will soon be satisfied that manure cannot be put in the beds too fresh, provided the layers are so thin and compressed that violent heating is avoided. Such beds generally become a mass of spawn, and continue heating a long time. A peculiar treatment, however, has something to do with long bearing. When the beds seem a little exhausted it is well to sweep them clean, and allow the surface to become a little dry. Then, in eight or ten days, make a few small holes over the bed, and give a good watering with water at from 80° to 90°, so that the water will pass down into the manure, pat the bed gently over with the back of a clean spade, cover with clean litter to keep in the heat and moisture, and often in such cases in a week or two you will have a white carpet of Mushrooms.

Much depends on the spawning. Be sure the heat of the bed is on the decline before inserting pieces of spawn about the size of a walnut—if the spawn is good, about 8 inches apart. At spawning, the heat of the bed should be about 80°. If after spawning the heat should seem to fall a little, add from half an inch to an inch of fresh droppings all over the bed, and if the temperature keep all right do not be long in adding, as a covering, from 1 to 2 inches of earth; 1½ is a good medium thickness. When the spawn runs it will make heat enough for itself. To assist it at first, a little covering over the bed is useful, but not so much as to cause the bed to be overheated. The general management has often been given, and in varied circumstances.

The above method is chiefly applicable in cases where it would be desirable to get rid, or nearly so, of all labour in preparing the materials. We speak confidently, because from frequent practice. In fact, other matters attended to, as care of heat at spawning, &c., we are quite sure that the best and the most lasting crops are obtained from beds where the manure used is freshest, and least exhausted by heating previously. The placing thin layers on the bed, and consolidating as you go, keeps up the freshness and prevents exhaustion from overheating at first. We may here add that the materials referred to are the best for Mushroom beds; we have been forced to be content with very inferior material, but we always liked to have a surfacing of such horse droppings, except when we had fermented common dung for the purpose, as used to be done for Cucumber and Melon frames. The half-decayed dung from old beds and linings of Cucumber and Melon frames makes also fine Mushroom beds, either flat, sloping, or on the ridge, if built firmly and a fair depth is given to them. No plan, so far as labour and preparation are concerned, will beat the above where only a small daily supply of material can be obtained.

FRUIT DEPARTMENT.

Mulched a number of our bush and pyramidal fruit trees, to arrest the moist vapour as it rises. We fear even with that help, Apples and Pears, however good they may be, will be small. We would have watered some of them, and wall fruit trees, if we could before this mulching. The ground is in general warm enough now for general purposes, and, therefore, the mulching will do no harm, if it keeps heat and moisture in, though it keeps extra heat out. Early mulching is often injurious, because it keeps the heat of the sun from acting freely on a cold soil. By waiting until the soil is heated, the mulching will be beneficial in dry weather, and if wet comes, the manurial qualities in the mulching will help to entice the roots to the surface. Laid a part of our Strawberry runners in pots intended for forcing, and would have done more, but with us runners are scarce. Strawberries, too, are getting thin. From the first planted-out forced plants we have got a few dishes, and regret we had not more out early, as the later-planted ones have suffered from the drought. Mulched again the pots in the orchard house, chiefly with horse dropping. It is amazing how soon such mulchings disappear, and leave the bare soil of the pots. The mulching greatly saves watering in all such cases. If we see not the chance of rain water, we will mulch the surface soil of these houses, even though we thus keep heat out. We have been obliged to do so with the borders of Peaches and Apricots to within some 4 feet of the wall, to keep them moderately moist, as otherwise the trees would have suffered from dryness. We have our own views as to planting the borders of fruit trees, but we cannot help ourselves; ours are rarely empty, but we generally contrive to have low-growing things on them after the beginning of July, so that the sun may have free access to the trees. For some 4 feet from the wall we like the ground to be uncropped all the autumn, though that, too, is generally well filled in winter and spring. All bad policy in many respects, but when much must be had from little room, many a compromise must be made.

Extended pleasure grounds, and small gardens for vegetables and fruit, are a great mistake. The great part of the expense then goes for what merely pleases the eye, and does nothing whatever to gratify the palate. One gentleman complained to another that "his table was quite as well supplied, and yet you know I keep nearly double the number of men in my garden." Truly replied his host, "But then you have three times the extent of flower garden and mown pleasure ground. That is pretty and gratifying, no doubt, very pleasing to the eye, but it must be paid for. It is like investing a handsome sum in a fine painting, with this difference—that the painting purchased retains its beauty and costs but little more, whilst the flower garden, lawns, &c., during the whole of the pleasant months

are a matter of constant outlay, and are scarcely made nice before they require to be made nice again." Flower beds are bad enough when looked at in a utilitarian point of view, but they are nothing as regards expense when compared with a well-kept lawn. Strange that gentlemen with an eye to the economical—and matters will not be long right if that is not kept in view—will be content with an acre of kitchen garden and care nothing about some three to six times as much of lawn and pleasure grounds. As a practical advice to gardeners we would say, Be always chary in getting additions to your lawn. Recollect that addition will cost you extra work every week, at least all the summer months, and rollings, &c., in winter. A friend of ours, as a matter of improvement, was anxious to add about an acre to the already pretty lawn, and it would have been an improvement. The proprietor at once owned to the improvement, and said the addition could be made at once, but candidly added, "I cannot afford to give you more help, more labour power." The lawn has not yet been enlarged. We believe that now the gardener would rather have a half-acre added to the kitchen garden.

ORNAMENTAL DEPARTMENT.

A good deal has been done in potting Balsams, Coleus, &c., for late work, giving the former large pots and a cool place to keep them stubby. Cinerarias, Primulas have also been potted and pricked off, leaving still plenty of work to do in the overhauling and dividing of Ferns, &c. But the chief work of the week has been *mulching* our flower beds and ribbon borders. The first planted of these, and especially Calceolarias, are pretty full, and so far able to shade themselves. With a watering at planting, and a little help since at long distances, they have otherwise been treated a good deal on Mr. Castle's system, though not to the extent of no watering. A few slight showers, though not telling on the roots, refreshed and filled out the foliage. Of late, however, when the sun was bright they began to show some signs of distress, and therefore we resolved to mulch the beds. We have generally done this less or more every year to save watering, when we were sure that the ground was sufficiently warm to suit even the tenderest of the Pelargoniums. We have been later this season than usual, partly from being scarce of time and suitable material, and partly because the clouds so often promised the rains that did not come, that we were anxious that the beds should have a watering from the heavens before we put the mulching on. But for the Calceolarias being so strong we would have mulched them earlier, as nothing pleases them more than a bright sun overhead and a moist cool soil at the roots. These conditions secured, nothing is more easy to manage. Putting off the mulching so late rendered it impossible in many cases, as in that of Verbenas, closely covering the ground. A little could only be hustled in where there was an opening. For such a purpose anything is better than nothing, but it will always look and answer best when done neatly and with good material. The centres of our largest beds were thinly covered with half-rotted dung and leaves that had been used for Vine borders. This was too damp to pass through an open sieve, but it was nicely broken with the points of a fork so as to be well mixed and made rather fine, put with a shovel into the openings and then spread with the hands. The smaller beds and the outsides of the larger ones were covered over chiefly with old Mushroom beds that were passed through an inch mesh sieve or riddle, and this gives a neatness to the beds when finished. Without any watering from the pail or the clouds this mulching helps the roots by keeping the rising moisture about them, keeps the heat of the sun from penetrating so freely; and the only drawback is, that if we had a succession of warm heavy rains we might have more luxuriance in growth in some things than might be desirable. It is more pleasant, however, to neutralise too vigorous growth by removing some of the larger leaves, than to look on plants at all etiolated and as if they were half starved. All such mulching will soon be out of sight in autumn. We do not mean that the leaves will thoroughly cover it, for that they will do very soon, but the earth and roots together soon take it all away, so that scarce a trace of it will be left. Meanwhile it does its useful work. It takes more time than a good watering, which could only be given now from the surface, and which in such heat would steadily evaporate, but the influence of the mulching will continue until we hope a change of weather comes. When the soil is excessively dry and hot it is well to water before mulching, and mulch immediately before it has the chance of escaping upwards, and this is the plan we have followed generally in the kitchen garden; but in this case, if after mulching we should be forced to water, the water will run

underneath the mulching and get into the soil, whilst the surface of the mulching as a whole will remain dry. These minutiae may be useful where water is scarce. In a kitchen garden rough mulching is all very well, but it should be done neatly in a flower garden.—R. F.

TO CORRESPONDENTS.

. We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

N.B.—Many questions must remain unanswered until next week.

Books (*A Constant Reader*).—Hemfrey's "Radiments of Botany." We cannot name plants from leaves only.

FLORIST OR AMATEUR.—*Arpa* asks if a man who grows, advertises, and sells such horticultural flowers as Pelargoniums, Fuchsias, and Cyclamens, ought he to be classed as an amateur at a local show, and allowed to exhibit as such? Yes, if he does not live chiefly on such sales. A gentleman who breeds, advertises, and sells young is not a dealer, but an amateur.

STORING POTATOES (*C. A. G.*).—As you have no shed or other store place, take the Potatoes up immediately the leaves begin to be partially yellow; place the Potatoes singly in alternate layers with earth, and cover the whole a foot deep with earth. Have the heap on the north side of a wall. The tubers will keep without sprouting for years at a temperature of not less than 33° nor more than 55°.

GRUBS ON PEAR LEAVES (*J. T. Y.*).—They are the larvæ of the Pear Saw-fly, *Selandria* a tip-top, and called by gardeners the slimy grub. Dust the leaves thoroughly with fresh-sifted quicklime, and syringe after a day or two. Repeat the process if needed.

SEEDLING PELARGONIUMS (*M. C.*).—Every petal was shed and the box smashed. It is useless to send full-blown Pelargonium flowers, the petals always fall.

ROSEBUSHES OF IRON—"A. Y. Z." wishes to know if anyone can inform him who are the principal makers of rosebushes of light wire material.

HARDY FERNS (*J. N. C.*).—Two dozen distinct and not expensive kinds are:—*Asplenium adnatum*, *Asplenium trichomanes*, *Athyrium filix-femina*, *A. filix-femina plumosa*, *A. filix-femina Frizellii*, *Blechnum spicatum*, *B. spicatum multifidum*, *Cystopteris fragilis*, *Lastrea dilatata*, *L. filix-mas*, *L. filix-mas cristata*, *L. oreopteris*, *Polypodium dryopteris*, *P. phlegopteris*, *P. vulgare*, *Polystichum angulare*, *P. angulare proliferum*, *P. aculeatum*, *P. lonchitis*, *P. alpestre*, *Scelopendrium officinale*, *S. var. multifidum*, *Lastrea recurva*, and *Allosorus crispus*. "The Fern Manual" will suit you. It can be had free by post from our office if you send 5s. 4d. in stamps with your address.

GLOXINIA, ACHIMENES, AND CALADIUM PROPAGATION (*R.*).—*Gloxinia* are readily propagated from leaves or parts of a leaf, but for general propagation it is well to take the whole of the leaf and a part of the leaf-stalk, and insert about an inch of it in a compost of equal parts light loam, sandy peat, and silver sand. They may be put around the sides of a pot, and be placed in a house with a gentle heat, or in a hotbed where they will form bulbs and be good plants the second year. They should be kept moist and shaded from bright sun, and carefully watered. In about six weeks they will be established, and should be continued in a stove until autumn, when gradually withhold water, and keep dry, but not dust dry, over the winter. In February pot off the small bulbs singly, and in small pots, placing in a hotbed. They will give shoots and flowers next year in due course. *Achimenes* are propagated by division, or properly increase of the roots, which are plentiful in most cases after a year's growth, and also by cuttings of the young growths, which strike freely in a hotbed, inserted in sandy soil, as described for *Gloxinia*, and in about three weeks they will be well rooted. Cuttings of *Achimenes* flower well the first year, and do nearly as well as those having a start from the root. *Caladiums* are increased by offsets in spring, they being taken off in spring when the plants are fresh potted. *Gloxinia* and *Achimenes* are cool stove plants, requiring the assistance of a hotbed to start them in the spring, and then a rather shady position, but near the glass, in a stove or vinery. When flowering they do well in a not-too-airy greenhouse or conservatory, being removed back after flowering to a stove to ripen the growth and mature the roots. None of the modes of propagation above named will give new varieties; that must be effected by hybridising and sowing the seed. *Caladiums* require a warm, moist stove for their successful cultivation.

CANNA SEED SOWING (*Item*).—You may now sow the seed of *Canna discolor floribunda* in a hotbed, and keep the plants in a stove during the winter, with the soil inclining to dryness, but it will not be necessary to dry them off like established plants. They will be strong for next year.

TURF BARE UNDER LIME TREES (*One who Likes the Turf*).—The roots of Lime trees are not more injurious to turf than any others; indeed, they are not nearly so bad as Ash. The grass being bare, we have no doubt, is due to the roots of the Limes making the ground poor and dry, the foliage depriving the ground of considerable moisture and light. We should advise you to scratch the surface well with an iron rake, sprinkling on it some very rotten short manure or rich soil, and then sow over it some grass seeds in moist weather, and of kinds that do under trees, as *Poa nemoralis sempervirens* and *Festuca druscula*, and some white Clover. Though September is a good time to sow grass seeds, we should prefer spring, as the ground will then be moist, whilst in September the ground under trees is often little better than dust; but if you have moisture in autumn, by all means sow then. There is no necessity for taking up and relaying the turf every year. A few grass seeds in all that is required.

ORANGE TREES NOT FRUITING (*H. D.*).—Without a greenhouse it is

difficult to grow the fruit to any size; they generally fall, as yours have done in former years, when of the size of peas. The only thing that would cause them to remain and grow to full size is more heat; indeed, to have good fruit a heated house is necessary—a warm greenhouse, in fact, though they do very well in a vinery, yet to have the fruit full-flavoured and juicy they require a temperature in autumn and early winter of not less than 5°. Fruit on trees in a cool house formed this year will not ripen until the end of next summer or autumn.

LILIES OF THE VALLEY (*A Subscriber*).—The plants multi-stemmed flower every year, but they, of course, vary in different years. Sometimes the flowers are more abundant one year than another, but they flower more or less every year. You may secure very good pots by choosing those roots with plump crowns only, and potted pretty closely together they would do well in a gentle heat or in a greenhouse.

COLEUS LOSING COLOUR (*Item*).—We apprehend yours is the *Coleus Verschaffeltii*, and that is losing colour through being kept in a shady position. Keep it in a light position, and put in a compost of two parts fibrous loam, and one part leaf soil or old cow dung, with a free admixture of sharp sand, and good drainage. With that your plants will recover their beautiful dark colour.

DALCHAMPIA ROZELEANA ROSA CULTURAE (*A Constant Reader*).—This is one of the most beautiful plants, and requires but little skill in cultivation. We have it now in a vinery beautiful, with its bright rosy pink bracts contrasting, as they do, well with deep green, graceful, drooping Oak-like foliage. It is seldom or never out of flower, and the plants bloom when a few inches high. It is readily raised from seed, which ripen freely. Sown when ripe in sandy peat and loam, and placed in a hotbed, the plants soon attain to a flowering state. It requires a cool stove, but will do well in a vinery or even a greenhouse in summer; indeed, we think it will do in a warm greenhouse in winter, but not having tried it we cannot say positively. We grow it in a compost of equal parts sandy peat, fibrous loam, and leaf soil, with a free admixture of sand, and afford good drainage. The potting is done in April; that satisfies its wants until autumn, then we again repot, removing what soil we can without interfering much with the roots, and give a moderate shift, and we have flowers all winter. In point of moisture it requires the soil moist, good supplies when the soil becomes dry, and a moist atmosphere. With frequent sprinklings overhead it is at home, but as that interferes with the beauty of its bracts, a moist atmosphere is necessary, as it is rather subject to red spider, but that yields readily to a sponging with a solution of soft soap, 2 ozs. to the gallon. Being very enduring of a dry atmosphere, it is one of the most useful of plants for house-decoration. We cannot name plants from leaves. Specimens with both flowers and foliage are necessary.

PLACING CAMELLIAS AND AZALEAS OUT OF DOORS (*J. B. Boyd*).—It is not desirable to place out of doors *Camellias* and *Azaleas* that have their bloom buds well set, and have been well hardened off; they are best continued under glass in a cool, airy, slightly shaded house, or one with an easterly aspect will answer very well. They are better under glass, for they are secured a greater uniformity of atmosphere. Placed out-doors they have to contend against the change of atmosphere consequent on removal. The weather may be hot, dry, or its opposite—very wet, and the plants are scorched by the heat and dryness in the one case, and excited to a renewal of growth by the other, and before they are housed they have been deluged with wet it may be; anyhow, they cannot be placed out-doors without danger of a check, nor removed in-doors without fear of another, hence we consider them best retained under glass. If placed out-doors at all they should have a position shaded from the mid-day sun, and be carefully attended to with respect to water. They should be housed at the close of September.

TREE FERNS (*Item*).—*Asplenium excelsa*, *Cooperi*, and *australis* will succeed in an ordinary Peach house, but not in that from which frost is not excluded in winter. All do admirably in a vinery; better there than in a Peach house.

EQUISETUM ARVENSE ERADICATION (*E. P. P.*).—From the specimen and later description you give of it we find it is the Corn Horse-tail, and not *E. fluviatile*, as we thought from the former description. It is found on land of a sandy nature or light loam, the subsoil being sand or a layer of that overlying a marly blue clay. The land to all appearance is dry, at least its surface, from its sandy nature, soon becomes dry after rain, but upon examination at a depth of 2 or 4 feet it will be seen that the ground is one spring of water; the drain fills soon from the loose nature of the sand. No land needs draining so much as this. We remember a field that was so poor from the sandy soil, that it was only practical to get Rye and Oat crops off it. It was one mass of Horse-tail every year. The land was drained, would-be *suavis* laughing at the idea. At 3 feet there was plenty of water, and the *Equisetum* roots were lower than that. The result was that the Horse-tails began to grow less every year, and were in a short time reduced to a minimum. The land had a good dressing of manure, the under strata of the same field, and it was sown with Wheat and produced a capital crop—over sixty bushels per acre. We should have said that the drains were only laid 3 feet deep, and with the old horse-shoe tiles with loose, flat bottoms. Though laid on straw in some places, and the tiles covered with that material or loose, small brushwood, the drains soon filled with the sand, and the Horse-tails began to grow thicker and faster. The occupier, by the way, a practical drainer all his life, determined on undoing what he had done, laying-in pipes down into the clay—sequel, death to the *Equisetum*. The land gave better crops, and he soon had offered him land to rent that the farmers would not have. We say, therefore, Well drain the land and the Horse-tails will disappear. They root deeply, require moisture; that taken off, they disappear. Frequent cutting-off the tops will tend to weaken them, but we need to strike at the roots. The drains should be about 21 feet apart, and deep—not less than 3 feet 6 inches; 4 feet and over if you can get an outfall.

ENDURANCE OF STRAWBERRY BEDS—PLANTING (*E. P. P.*).—As lately stated in "Doings of the Last Week," a Strawberry bed will bear well for many years, if the plants are gone over every year, the smaller beds of the plants thinned out, and the best left, and the plants well manured between the rows. By the usual plan of planting and management, from three to four years may be considered a good time to remain. When runners are used they generally produce fairly the first season after planting, very abundantly the second, not quite so good the third, and moderately the fourth. We seldom keep a bed above three years, and that permits rotation of cropping. We are now digging down three-year-

old Strawberry plants, following with Broccoli, &c. The above plan of thinning is useful to those who dislike the bother of making fresh beds, but the ground has not the same rotation. You can rarely obtain all advantages by following out any one mode. Runners should be taken off as soon as you can get them. To make the most of them for a new plantation, it is well to lay them in pots, or encourage them to root in the ground. If not wanted for such purposes, the sooner runners are removed the better, as more light and air will go to the old plants. In forming new beds rotten manure should be used, but if scarce, rank manure may be tramped down, and some rotten manure incorporated with the surface soil to encourage free rooting. The sooner all this is done the better. Whilst this is doing, as recommended to another correspondent, you might prick out your runners in a rich bed to be raised with balls, and afterwards transplanted. When we have been scarce of ground we have used the space intended for a new plantation of Strawberries for autumn and winter crops of vegetables, had the runners pricked out in rich soil, say 4 to 6 inches apart, and having got our ground nicely pulverised in spring, we have lifted our Strawberry plants with nice balls, and they grew away strong at once, and produced a fair crop the first summer. Where ground is of less consequence than a little additional labour, then it is best to plant out at once to where the plants are to remain. We may add that in cold places keeping the plants a little thick in a bed gives them a good protection.

LASTING OF MUSHROOM BED (E. R. P.).—The Mushroom Bed will most likely continue bearing for some time, but it should be covered from the sun with litter as well as a mat, and should not be allowed to get dry. See hints on Mushrooms. Plenty of air will get through a covering, say 3 inches deep. In very hot weather you may sprinkle the covering outside so as to keep the bed cool. Heat in the present and next month is to be kept out, rather than let in. The bed will be of little use for renewing if it heats well. You must make a new bed of fresh materials.

SEEDLING STRAWBERRY DUKE OF EDINBURGH (MOFFAT'S).—This variety received a certificate at the Royal Caledonian Horticultural Society's Meeting on the 13th inst. It is a strong grower, and very prolific, and produces very large cockscomb-shaped fruit. It is a cross between Keen's Seedling and Elton Pine. Some of the berries sent to us were 8 inches in circumference, deep crimson-coloured, and very highly-flavoured.

STRAWBERRY PLANTS FAILING (R. H.).—See the remarks of "R. F." and others in late numbers, so far as sterile plants are concerned. As yours bloomed freely, that could not be the reason. The produce in most places afflicted with the drought has been much less than usual. Our gatherings will soon be over as respects the main crops. The shrivelling-up of the flowers we would attribute to over-ripeness. The turning black of the centres of the flowers we would attribute to frost, and the plants suffered from this in many places. The ground for a new plantation should be got ready at once, trenching two spits deep if the soil is good, incorporating a layer of dung with the lower spit, and when finished pricking-in with a fork another layer—say 2 or 3 inches near the surface. You may plant as soon as you get runners; but if this dry weather lasts, we would advise you to prick out the runners, say 4 inches apart, in a rich bed, and when they had formed a ball of roots, lift and plant with balls in the prepared ground. It will be easier to water and shade a small bed than a large piece.

GARDENERS' ASSISTANT (Inquirer).—We cannot either advise or interfere in a case of such petty differences. Even if you have any claim for expenses, which we doubt, the time and cost of recovering them would purchase them dearly.

INSECTS (E. F. W.).—The eggs on your Rose leaf (from which the young have been hatched during its transit by post), are those of the Brown-tailed moth (*Forthebia caryosoma*). (*H. S.*)—The curious fly found in a window in Bradford, is the *Sirex Gigas*, the larva of which makes cylindrical burrows in Fir trees, often doing much mischief.—*I. O. W.*

NAMES OF PLANTS (Cottager).—The shrub is *Spirea ulmifolia*. We cannot name varieties of florists' flowers. (*J. Bathmaker*).—We cannot name the varieties of florists' flowers. They are in regions.

POULTRY, BEE, AND PIGEON CHRONICLE.

REARING LARGE FOWLS.

The number of dwarf specimens, even of the largest breeds, which are to be seen at any of the poultry shows, is an evidence that the absolute essentials for rearing fine chickens are very imperfectly understood by many who have sufficient interest in the subject to pay for first-rate stock but know not what to do with them. It is not enough to hatch Dorkings, Cochins, or Brahmas of the very best strains, the eggs may be the very best that can be had for money, but if the chickens are not properly treated they will never make fine birds.

With regard to breeding, I am quite certain, after varied experience, that the largest and finest fowls in our climate are produced from chickens hatched between the end of March and the end of April. For Dorkings alone, which grow early and are delicate, the period ought perhaps to be extended to the end of May; but Cochins or Brahmas hatched during that month will not, except in very favourable circumstances, attain great size—at least so great as April birds. March birds are often large, but on the average are inferior to April birds. As to the parents, medium-sized birds are quite as likely to produce large chickens as unusually large specimens. Hens with long backs and legs will generally produce large chickens; and

though this conformation is faulty in itself, if they be mated with short, compact, "dumpy" cockerels or cocks, the result is usually good.

The great essential in feeding is to give a constant and careful supply of soft food. It is here, perhaps, that novices most frequently fail, the opinion that "grit"—*i. e.*, the kernel of the oat—are the only proper food for chickens being about as widely diffused as the idea that peppercorns and rue are good for the "pip," or whatever other ailment a fowl may have. Such feeding gives no trouble, and may answer well for Game or Hamburgs, but it will never rear large birds, for the simple reason that the food is not digested fast enough for rapid growth. Good oatmeal, good sharps, good barleymeal, and ground oats when they can be got—these are the staple food, and must be given not less than every two hours throughout the day till the birds are at least three months old, when the time may be gradually extended till after a few more weeks they have only three allowances of meal and one of dry grain per day. The last feed at night should always be grain; grits or coarse seed at first, and afterwards buckwheat. The latter grain I always find chickens prefer to anything else, but the one meal a day of it is quite enough.

Oatmeal alone is very dry and hard to mix nicely. I also find chickens fledge badly on it. It is better to mix it with crumbled bread, which removes all difficulty, while the birds like it better and eat more. Another great point is, with every meal to get a quantity of fresh grass, cut it into chaff an eighth of an inch long with a pair of shears, and add it plentifully to the food, mixing the whole with milk. The grass will keep the food moist and sweet long after it would be sour without, besides being eagerly relished by the chicks and keeping them in health. I like this plan far better than giving a turf, which may, however, be added, but is not nearly enough green food for them alone. By adding cut grass to every meal without exception, and throwing some down by itself also, chickens may be reared quite as large and in perfect health in a yard 15 feet square as if they had the range of acres. To get the beautiful "condition" of fowls at liberty in such circumstances is indeed impossible, but health and size are within the reach of all.

Milk should be used plentifully, not only mixing every feed with it, but giving the chicks a good drink of it every morning. If, in cold or early seasons, it is slightly warmed all the better; and this morning drink helps them wonderfully, while it will be found both cheaper than, and quite as effectual as, the custard which is sometimes recommended. I need not say that early chickens must be fed at night by candlelight, but April birds do not require it.

Another most valuable adjunct in rearing the large breeds, as I have elsewhere explained in treating on Brahmas, is what is called ground bones or "bone dust," for the knowledge of which, as I have there stated, I was first indebted to my friend Mr. John Stuart, of Helensburgh. I have often found it very difficult to procure, but of its value I can speak without hesitation. It adds both to the eventual size and stamina of the birds, and has a marked effect in postponing their "setting," keeping them raw or leggy, and preventing them in a great degree from getting fat. It appears, in fact, to have nearly all the good effects of forcing with meat without its evils. It should be added in about the proportion of a tea-spoonful to half a pint of meal, and be given thus in every feed from the time the chicks are ten days old. I may just remark that the foetid smell is of no consequence so far as the chickens are concerned; but as the bone dust imparts a most offensive taste to eggs, it should be discontinued before the pullets lay.

At about six weeks old the oatmeal and bread may be discontinued for a mixture of equal parts of sharps, or middlings, and barleymeal, and the grits at night may be exchanged for buckwheat. The milk, grass, and bone dust should be continued, however, and special care be taken that no more be given than is eaten up, so that every two hours the birds may have both fresh appetite and fresh food. If any does remain it must not be left for the chickens to finish, but taken up and thrown to the old fowls. The water, too, must be kept clean and cool, always adding a little sulphate of iron in wet or cold weather. A little camphor kept always in the water is also good.

I think chicks grow faster and do better away from the hen as soon as they are fledged enough, or the weather is warm enough, to keep them from being chilled. In that case care must be taken that until they roost they sleep on very dry ashes or earth, and if the ground be damp their bed of ashes

should be put on a board. Though it has been said already over and over again, it is still needful to repeat, that if large birds are desired the cockerels must be separated from the pullets by the time they are, say, three months old.

To the above feeding a little meat may be added once a-day with advantage, but is not needful. What is needful is, not only to feed well while with the hen, but to continue the same careful, cleanly, liberal, constant feeding till the birds are full grown. Growing chickens cannot be overfed so long as they have only their regular plain diet and eat it with good appetite. It is, perhaps, for this reason that, so far as my knowledge goes, chickens seldom grow so well in an unlimited run as in good grass runs of moderate size.

I have always noticed that my chickens did not grow so well in very hot dry seasons; and though I have never tried it systematically, I believe watering the ground at intervals in hot weather would have a beneficial effect on the birds as well as upon the soil, where the runs are of small size.—L. WRIGHT.

VERMIN IN HEN HOUSE.—My hen house was literally alive with parasites. I procured a packet of N. Howe's preparation from carbolic acid, and the parasites are completely destroyed.—Mrs. THOMAS, *Felmersham, Beds.*

[Carbolic acid may be obtained from any chemist.]

GUILDFORD POULTRY EXHIBITION.

It is very rarely indeed that any committee can boast of so good an entry as took place at Guildford on Friday last, particularly as a first Show. This is, no doubt, well deserved, as the prize schedule was a most liberal one, comprising not only ten pieces of plate, but also the "Poultry Book" and "Pigeon Book," as extra prizes, beyond the money premiums. The County Hall is well adapted for showing specimens to advantage, and had there been a little different arrangement in the disposal of the best positions for light to these classes most requiring it, in lieu of a very extensive "Selling class" monopolising the principal position in the Show, the management would have been faultless.

The *Spanish* proved such a class as can only be rarely met with, and the first-rate condition in which most of them were shown is worthy of the highest praise. The *Grey Dorkings* were not less perfect, and the entry was a large one; but the *White* and the *Black-coloured Dorkings* were very few in number, although a plate prize was offered for the winner of the last-named breed. The *Light Brahma's* were just as good as might fairly be anticipated in this neighbourhood; most of the hens were, however, in very ragged plumage, and altogether out of show trim. The *Gamb* classes were warmly competed for by Messrs. Matthew, Hall, and Laming, with pens of no common character. The chief of these pens were shown in really faultless condition. The *Aylesbury Duck* class was perfection, Mrs. Stamons and Mr. Fowler with extraordinarily fine pens completely throwing into shade all other rivals. The *Rouens* were naturally in the worst of feather. The class for any variety of *Ducks* was decidedly the worst filled in the Show, consequently the first and third prizes were withheld. *Geese* and *Turkeys* also were as well represented as at the very largest of our shows.

To speak too highly of the *Pigeons* is impossible, most of the London fancy being competitors; so good were they that in some classes every pen was highly commended that was left after the selection of the winners. Most of the *Pigeons* were well shown and with perfect fairness. We regretted, however, to find a pen of *Turbits* heavily "trimmed," the beard on one side of the flight feathers having evidently been carefully stripped off to insure favourable appearances in the eyes of the Judges, for it would not affect the powers of flight in this bird at all. On this discovery the pen was, of course, "disqualified." Some well-marked "Spots," and some rather superior *Archangels*, were matters of note in the "Variety class" of *Pigeons*.

The *Silver-Grey Rabbits* were perfection, but the competition in *Lop-eared*, and those for weight, might have been much better.

The weather was as fine as could be wished for, and great numbers of visitors from the metropolis were in attendance.

SPANISH.—1, G. Tonkin. 2, C. Howard. 3 and 4, F. James, Peckham Rye, Surrey. **DOEKINGS.—Coloured.**—Cup, Gun-on & Jefferson. 2, L. Patton, Bishop's Hall, Taunton. 3, F. Mr. Hewitt, of Birmingham, and Mr. Tegetmeier, of London, were the Judges.

LEICESTERSHIRE BIRD SHOW.

This was held in the Grand Stand building on the 5th inst. The following prizes were awarded:—

CANARIES.

NEWBORN.—Clear Yellow.—1, Moore & Wynn, Northampton. 2 and 3, S. Tomes, Northampton. c, J. Smith, Leicester. **Green Egg.**—1, Tomes. 2, J. Goske, Leicester. 3, H. Hudson. **Grey.**—c, H. Audley, Leicester; J. W. Hunt, Bovey. **Variogated Yellow.**—1 and 2, Moor & Wynn. 3, S. Tomes. **Variogated Buff.**—1 and 2, Moore & Wynn, Northampton. 2, S. Tomes. c, H. Audley, Leicester; H. Hadley, Thurmaston. **CRESTED.—Buff.**—1, Moore and Wynn. 2 and 3, J. Goske. **Variogated.**—1 and 2, Moore & Wynn. 3 and c, S. Tomes. **BELOANS.—Clear Buff.**—1 and 2, H. Hadley. 3, J. Mason, Leicester. **Variogated Buff.**—1 and 2, H. Hadley. **LEAGUES.—Golden-quilled.**—1 and 2, J. Goske, Leicester. 3, H. Hudson. **Leicester Silver-spangled.**—1, T. Hudson, Bullwell. 2, J. Essex. 3, S. Tomes. **CINNAMON.—Yellow.**—1, Moore & Wynn. 2 and 3, W. Burton, Hackley. c, S. Tomes (?). **Buff.**—1 and 2, S. Tomes. 3 and c, Moore & Wynn. **GOLDENFINK.—Yellow.**—1, T. Cradock, Stanton Wyville. 2, Moore & Wynn. **Buff.**—1 and 2, J. Butt, Leicester. 3, J. Goske. **Extra S.** Moore & Wynn. c, T. Harrison, Stanton Wyville. **TEN CANARIES.**—1, J. Essex. 2, W. Burton. 3, J. Goske. **Extra 3.** J. Mason.

BRITISH BIRDS.

PULPINEER.—1, J. W. Hunt, Bovey. 2, M. Cave, Leicester. **GOLDFINCH.**—1, Mrs. F. Jones, Loughborough. 2, J. Goske. **LINNET.**—1, J. Mason. 2, M. Cave. **SKYLARK.**—1, Master H. Cox, Leicester. 2, M. Cave. **MAPIES.**—1, Master H. Cox.

FOREIGN BIRDS.

CHUCKATO.—1, T. Hopkins, Leicester. **PARROT.—Green.**—1, J. Billington, Leicester. 2, H. Hadley. *Green or any other variety except Green.*—1, Mrs. Duff, Leicester. 2, Burgess, Leicester. 3, R. Gant, Leicester. **Equal 3.** J. Smith, Leicester.

PIGEONS.

TEMBLES.—1 and 2, H. Hadley. **CARRIERS.**—1 and 2, H. Hadley. **POUTERS.**—1 and 2, H. Barshy, Leicester. 2, G. Sturges, Leicester. **RIFTERS.**—1 and 2, H. Hadley. **JACOBINS.**—1 and 3, H. Hadley. 2, G. Sturges. **FANTAILS.**—1, W. Burgess. 2, H. Hadley. **ANY OTHER VARIETY.**—1, H. Hadley. 2, W. Burgess.

JUDGE.—Mr. A. Wilmore, London.

ROSSENDALE AGRICULTURAL SOCIETY'S POULTRY SHOW.

(From a Correspondent.)

This was held at Stacksteads on the 11th inst. There were 152 entries of poultry and 85 of Pigeons. The pens were supplied by Mr. Turner. Many spoke of the excellent arrangements, and to the feeding, &c., of the poultry, and the courtesy of the Committee and Secretaries. Mr. Beldon obtained the challenge cup offered for the most successful exhibitor in the poultry classes. The Show on the whole was pretty satisfactory, and would have been more so but for the disastrous flood which occurred a few days before in the neighbourhood, doing damage to over £100,000, which was the means of seriously crippling the exchequer of the Society. The Society's friends, and the successful exhibitors especially, might be reminded to render some little assistance to the Committee. Their grand stand was completely washed away, besides a very large quantity of boards.

GAME.—1, G. Bagnall, Draycott, Cheadle. 2, C. W. Brierley, Middleton Cock. —1 and 2, C. W. Brierley. **COCKERAL.**—1, T. Dyson, Claytons, Halifax. 2, R. Payne, Brierfield, Burnley. **CHICKENS.**—1, T. Dyson. 2, C. W. Brierley. **DORINGS.**—1, J. Stott, Healey. 2, J. White, Warley. **SPANISH (Black).**—1, H. Beldon, Bingley. 2, C. W. Brierley. **COCHIN-CHINA.—Cinnamon and Buff.**—1 and 2, W. A. Taylor, Manchester. *Any other Variety.*—1, W. A. Taylor. 3, H. Beldon. **BRAMMA Pouter (Any variety).**—1, H. Picketts, Birkdale, Southport. 2, W. Hargreaves, Baccup. **HAMBURGERS.—Golden pencilled.**—1, H. Picketts, jun. 2, Early, Skipton. 3, H. Beldon. **CHICKENS.**—1, H. Picketts, jun. 2, H. Beldon, Bingley. **Golden-spangled.**—1, H. Beldon. 2, H. Picketts, jun. **CHICKENS.**—1, J. Andrew, Waterhouses, Ashton-under-Lyne. 2, E. Brierley, Heywood. **Silver-pencilled.**—1, H. Picketts, jun. 2, H. Beldon. **CHICKENS.**—1, H. Picketts, jun. 2, H. Beldon. **Silver-spangled.**—1, J. Fielding, Newchurch. 2, H. Picketts, jun. **CHICKENS.**—1, H. Picketts, jun. 2, J. Fielding. **Buff.**—1, N. Mark. **DORINGS.**—1, H. W. Hingworth, Healey. **CHICKENS.**—1, J. Cockroft, Hamcliffe. 2, C. Sidgwick, Ryddlesden Hall, Keighley. **BANTAM.—Game.**—1, T. Barker, Hill End. 2, T. Sharples, Forest Bank, Ravenstall. **Game.—Single Cock.**—1, G. Haworth, Helmshore. 3, T. Tattersall, Tunstead Bottoms. *Any other Variety.*—1, J. Walker, Halifax. 2, H. Beldon. **ANY OTHER VARIETY.**—1, H.

Dublin (Polands). 2, J. Watts, King's Heath, Birmingham. SELLING CLASS.—1, F. & C. Haworth, Haslingden. 2, W. A. Taylor, Manchester. DUCKS.—*Aylesbury*.—1, E. Leech, Rochdale. *Rouen*.—1, E. Leech. 2, H. B. Smith, Brooklands, Broughton, Preston. *Any other Variety*.—1, C. W. Brierley. 2, H. B. Smith. *GESE* (Any variety).—1 and 2, E. Leech. TURKEY.—1, E. Leech. 2, C. W. Brierley.

PIGEONS.

CARRIERS.—1 and 2, E. Horner, Haslemere. TUMBLERS.—1 and 2, J. Fielding, jun., Rochdale. BARRS.—1, J. Fielding, jun. 2, E. Horner. OWLS.—1, J. Fielding, jun. 2, J. Hawley, Bingley. POUTERS OR CROPPERS.—1, E. Horner. 2, J. Hawley. FANTAILS.—1, E. Horner. 2, H. Yardley, Birmingham. TRUITS.—1, J. Fielding, jun. 2, H. Yardley. DRAGONS.—1, J. Hawley. 2, J. Watts. TRUMPETERS.—1, E. Horner. 2, J. Hawley. JACOBIANS.—1 and 2, E. Horner. ANTWERPS.—1 and 2, H. Yardley. ANY OTHER VARIETY.—1, E. Horner. 2, H. Yardley.

The Judges were Mr. Fielding, Trentham, and Mr. Dixon, Bradford.

OUNDLE EXHIBITION OF POULTRY AND PIGEONS.

THE entries this year both of poultry and Pigeons at the Oundle Show were remarkably good, and the weather proved most favourable, consequently the success of the Show was unmistakably good. The tent erected for the poultry was large and airy, and the pens supplied by Messrs. Turner, of Shilfield, completed the arrangements in a most satisfactory manner.

One of the best varieties shown were the Grey *Dorkings*. The Game fowls were mostly very superior birds, but many of them were fast falling into bad condition, moulting having commenced somewhat earlier this season than usual amongst most varieties of poultry. The classes of *Cochin* fowls were all good, being decidedly the best ever seen at Oundle. A few good pens of *Hamburghs* were shown, but the entries were few in number. *Bantams* were not so good as those shown last year at this meeting. *Turkeys* and *Ducks* were as fine as could be desired; but the *Geese* were not remarkable in any way.

It is only a rare occurrence that we find a better competition than took place in *Pigeons*. Each exhibitor showed a collection of three pens, the only restriction being, they must be of three different breeds, and this portion of the Exhibition proved most interesting to those nine persons who competed, not an indifferent pen being on view.

The silver cup given by Lord Lilford, for the best pen of poultry of any kind exhibited, was won by the first-prize pen of Spanish hens, closely pressed by the first-prize pen of *Dorking* hens.

DORKINGS.—*Hens*.—1, J. Longland, Grendon. 2 and 3, R. Wood, Clapton, *he*, Rev. E. Barrum, Great Berkhampstead. *Pullets*.—1, J. Longland. 2, H. Yardley, Birmingham. *he*, J. Conkham; J. Watts, Birmingham. *c*, E. Wood. *Cock*.—1, 2, and 3, R. Wood. *Cochins*.—1 and 2, H. Yardley. *GAME*.—*Hens*.—1 and 2, H. Lotan, Oundle. 3, J. Stephens, Walsall. *Pullets*.—1, Green & Sutcliffe, Queensbury, Halifax. 2, H. H. Bletsoe, Ramwell. *Cock*.—1 and 2, S. Deacon, Polebrook Hall. 3, S. W. Smith, Manor House, Fitzharry. *c*, B. Cox, Moulton. *COCKS*.—1 and 2, H. H. Bletsoe, SPANISH. *SPANISH*.—*Hens*.—1 and Cup for best pen in show, J. F. Dixon, Cotgrave, Nottingham. 2, W. R. Bull, Newport, Egnald. 3, H. F. Cooper, Lichfield Street, Walsall. *he*, M. E. Collingwood, Peterborough; J. Stephens, Walsall; E. Smith, Rectory, Oundle. *Cock*.—1, H. F. Cooper. 2, J. Stephens. *he*, W. Bearpark, Auderby Steeple, Northampton; Lady G. Gordon, Orton Hall. *CHICKENS*.—1, W. R. Bull. 2, Lady G. Gordon. 3, M. E. Collingwood. *COCHIN CHICKENS*.—*Hens*.—1, J. W. Binsley, Northampton. 2, J. Stephens. 3, Rev. A. A. Longhurst, Fotheringhay. *he*, J. L. Hilliam, Ormskirk. *c*, W. A. Burnell, Winkburn Hall, Southwell. *he*.—1, W. A. Burnell. 2, J. Stephens. 3, J. A. Binsley. *he*, H. H. Bletsoe; H. Yardley. *c*, W. F. Checkley, Moulton. *CHICKENS*.—1, J. Stephens. 2, H. Yardley. 3, Rev. A. A. Longhurst. *he*, W. F. Checkley. *c*, H. H. Bletsoe; J. Dove, Moulton; W. A. Burnell. *BRAMMAS*.—1, J. Watts. 2, T. Rogers, Walsall. *HAMBURGHS*.—*Gold and Silver-pencilled*.—1, W. Bearpark. 2, Rev. J. Payne, Higham Fevers. 3, J. A. W. Underwood, Warrington. *Gold and Silver-pencilled*.—1, W. Bearpark. 2, J. F. Lovelidge, Newark-on-Trent. 3, J. Stephens. *GAME*.—*Hens*.—1, G. Annis, Clapham. 2, T. Boscawen. *he*, H. H. Bletsoe. 3, Deacon, Polebrook Hall; L. Caldwell, Oundle. *Any other Variety*.—1, E. Worley, Northampton. 2, J. Bead, Oundle. *ANY OTHER VARIETY*.—1, J. N. Easley. 2, E. Goodlife, Conington. SELLING CLASS.—1, S. Deacon. 2, J. Dove, Moulton. *GESE*.—1, E. Goodlife. 2, S. Deacon. *DUCKS*.—*Aylesbury*.—1, J. Dove. 2 and 3, S. Deacon. *he*, E. Goodlife (2). *Rouen*.—1 and 2, R. Wood. *Any other Variety*.—1 and 2, E. Goodlife. *c*, S. Deacon. *TURKEYS*.—1, J. Craig, Fotheringhay. 2, M. Kew, Market Overton, Oakham. *he*, J. A. W. Underwood; J. N. Easley.

PIGEONS.—*Three Pairs*.—1, H. Yardley. 2, J. Watts. *he*, R. F. Trayling, Peterborough; W. Lepper, Northampton.

RABBITS.—*Lap-earred*.—1, S. W. F. and N. Nassington. *Fancy*.—2, J. Clifton, Oundle.

Edward Hewitt, Esq., of Sparkbrook, Birmingham, officiated as Judge.

REPORTS ON RABBITS AT SHOWS.

I HAVE often wondered if better reports on the Rabbit section at shows could not be supplied to "our Journal." I am sure an enlarged and explanatory report of the various points of excellence would be much more satisfactory to the readers generally, and the prize-winners in particular, and not the mere record of prizes as now too frequently seen, and even at times the address of the owner of such prize-winner not fully given. Could not a few words be inserted as to the reason why such specimens received their honours, and some information be given respecting the merits of the whole exhibition of Rabbits? I can assure committeees, judges, and all who are officially connected with such shows, that any report, if not too long, will have space given it, and the report would evidence that some interest was taken in, and nice discrimination brought to bear upon, the merits or defects of the speci-

mens exhibited. Could we not have the number of entries in the various classes given, and any reason stated why this section of the show was attractive, or otherwise, to exhibitors, and a gentle hint to the "powers that be" as to the remedy, if such be requisite? I fancy I hear some one say, "But who is to do it?" Why, who so likely as the judge? or, if his duties prevent him, can no competent admirer be found who could devote an hour or two between each show he visits and the reports appearing in print? We find very intelligent and highly interesting reports from admirers of poultry, Pigeons, and bees. I am sure the hint given will be acted upon and very much appreciated. I promise that each exhibition in my neighbourhood shall have its Rabbits, when exhibited, alluded to if I can possibly find the time to look at them.—HIMALAYAN.

SWARMING.

THE swarming season is generally the most interesting period of the year to apiarians, but it is impossible to predict the hour or even the day when a first swarm will take its departure. If the stores are nearly exhausted, and unfavourable weather set in, no preparations are made for this event; or, if preparations have been made, and young queens are coming forward, the expected swarm not unfrequently delays its exit until the eldest royal lady leaves her cell. When this takes place, the old queen is almost sure to fall a victim to the animosity of the young one, unless the latter happens to be an only daughter. The presence of royal sisters in a hive renders a queen that has just escaped from her cell furious, and in her malignant hatred of maturing rivals she will, without compunction, commit matricide. I have never seen an old queen, when weather or other circumstances would not permit a swarm to make an exodus, destroy the royal cells or their inmates—her offspring. On a few occasions I have seen a top swarm go off just as the successor to the throne was about to obtain her liberty. The reigning sovereign does not appear to be animated by any hostile feeling towards her daughters, and the reason why she lingers in the hive till any of them are matured, and falls a sacrifice, is entirely owing to the bees in not sounding a timely note of alarm, and hurrying her away from a habitation that has become dangerous to dwell in, to some more secure place.

It was in this way I lost my two-year-old wingless matron, which I received from "APICOLA" in March last, and which, with her daughter, had conjunctly occupied one of his hives during the whole of last winter. Though this old queen had permitted her daughter to become a mother and divide the throne, yet her own powers, as far as I could judge, were not impaired in the very least. By the end of the first week of June she had peopled her hive to overflowing, royal cells were tenanted, and all requisite preparations made for swarming. Unfortunately the weather broke, no food was to be obtained from the flowers, and the stock had but a small store of honey laid up. With a temperature seldom above 55° or 56° at its maximum point a swarm was scarcely to be looked for; but whilst swarming was delayed time passed on, and the royal cells matured. On June 20th the eldest princess escaped from her cell, and went piping over the comb. I became concerned for the safety of the old wingless monarch, and forthwith opened the hive to search for her. Amid the vast multitude of bees I failed to find her, but every comb was brooded; some cells contained larvae not larger than pinheads, and I was satisfied that I saw eggs in others. I shut up the hive in the hope that my old favourite might somehow escape destruction; but in this I was disappointed, for not many hours afterwards she was dragged out dead and thrown overboard, having evidently been stung by her rival, which on the day following led forth a swarm.

But whilst using the common phraseology, and speaking of the queen leading forth a swarm, I beg to state my distinct conviction that queens do not lead out swarms, but are led forth by them. On two occasions, at least, I have witnessed in a glass unicombed hive the proceedings that took place immediately before a first swarm made its exodus. From the listlessness and clustering on the lower edge of the comb observable in the early part of the forenoon, it was not difficult to divine that a migration was contemplated. As soon as the day brightened up a few bees hurriedly left the hive, and after a short absence returned, we may suppose, with a favourable report; whereupon two or three bees advanced towards the entrance, and began to emit a series of sharp sounds, almost identical with the shrill notes of distress or anger which bees utter at nightfall as they run out and in at the entrances of their hives when tor-

mented by moths. These sharp sounds in a little while were caught up by other bees, and a troubled movement began, which gradually extended itself. At length the sounds became so merged as to resemble a continuous hiss, and a general running backwards and forwards over the comb followed. In the midst of the commotion the queen for a minute or two remained placid till the tumult became irresistible, and she also began to move. As soon as she was fairly in motion a rush was made towards the entrance, and her majesty, *volens volens*, fairly carried along with the crowd. The like procedure to that now described was noticed on the second occasion as well as on the first, and I have no hesitation in expressing my conviction that queens have very little to say in the matter of swarming, and that it is instinctively initiated by the bees alone when the arrangements within are complete, and circumstances without are favourable.—R. S.

DRIVING BEES.

ABOUT the middle of June last year I had a first swarm of bees. I hived them in a common straw hive, and about the middle of July I found it to be about 10 lbs. weight. The weight of the honey being tempting, and having heard people talk about driving bees, I tried the experiment. I had a man to assist me, and we turned the hive containing the honey and bees upside down (this was about 9 p.m., when the bees were all quiet); we placed an empty hive upon the top, then drew a piece of muslin round the place where the two hives joined, and commenced tapping round the under hive, which made the bees rush into the top one. Still we were uncertain whether the queen had gone up, and, consequently, placed the two hives in that position upon the bee-stand, and took off the muslin, leaving them over the night. The next morning they commenced working as if nothing had happened. In the evening I lifted the top hive to examine, and found the bees were working in it. I allowed them to remain another day in the same position. On the following morning a drizzling rain afforded a very suitable opportunity; I therefore took down the two hives, lifted the top one upon the stand again, and exposed the other to the rain. As a matter of course, the inmates, not liking the rain, fled in hundreds to their new abode. As soon as they all left I took away the hive containing the honey, and the bees continued working in their new home apparently as contented as though nothing had occurred. In the autumn I sold them for 20s., and they were a first-rate standard.

I believe there is no difficulty in driving bees out of one of Neighbour's hives, as described by Mr. Elcome. It is a very interesting process, and one I should greatly recommend, rather than allowing the bees to throw a virgin swarm; it should not be attempted after the middle of July, but earlier if possible, in order to allow the bees time to provide their winter storage.—Jas. GLESSALL, *Old Hall, Mithorp.*

[The objection to the above process is, the enormous quantity of brood which must have been destroyed. This difficulty may, however, be got over by transferring the bees into a moveable-comb hive, and utilising all the worker brood comb, by fitting it into frames in the manner delineated in page 72, of our seventeenth volume.]

HOW LONG ARE QUEENS IN HATCHING, AND WHEN DO THEY COMMENCE EGG-LAYING?

THE perusal of Mr. Pettigrew's recently-published "Handy Book of Bees," has set me observing, and even experimenting upon my own bees, with the view of correcting some of the mistakes which he has made in the natural history of our little favourites—mistakes which I know he is himself most anxious to rectify as soon as sufficient evidence has been adduced to satisfy him that he is really in error.

In the first place, then, Mr. Pettigrew states that "perfect queens are produced on the fourteenth day after eggs have been put into royal cells," whilst a worker is "in the cell twenty-one days," and he calls upon us to marvel at the shortness of time in which queens are in their cradle-cells. Huber, on the other hand, declares that queens occupy the cells sixteen, and worker bees twenty days respectively; whilst Dr. Bevan, who in this respect is followed by most later writers, assigns the same period to queens, but extends that of workers to twenty-one days.

In order, therefore, to determine which of these statements

was correct, I on the 7th of June placed an empty worker-comb in the centre of a populous colony. This comb when removed the next morning, was found to contain a great number of eggs deposited in the cells on both sides, and was then with a honeycomb on either side placed in a nucleus-box, which, having been supplied with a sufficient population of worker bees, was left to the development of royal cells. Three of these accordingly appeared in due time, all on the same side of the brood comb. One was speedily seen to be empty, and, of course, never advanced beyond the rudimentary stage; two were tenanted, and ultimately completed. The morning of the 23rd (sixteen days from the commencement of the experiment) witnessed the birth of a very large and handsome queen, and the remaining royal cell being cut open on the same day, was found to contain only a dead maggot, which had not progressed beyond the larval stage. This experiment conducted just at the height of a very favourable season, would seem to prove conclusively that Huber and Bevan were right in fixing sixteen days as the period required for the evolution of a queen bee, and I may conclude the history of the one in question by stating, that although I watched her with some care, I failed to determine the exact period of her impregnation, but that she commenced egg-laying on the fifteenth day of her age, and is now breeding most profusely.

With regard to the time occupied in the production of workers, I have this season obtained abundant evidence by placing numerous empty combs in the "brood nests" of various hives, and have invariably found that workers commenced hatching out not later than the nineteenth, and in some cases so early as the eighteenth day.

Taken together, these experiments prove that queens occupy only from two to three days less time than workers in coming to perfection, instead of seven days less, as stated by Mr. Pettigrew.

It should, however, be remarked, that although it does not seem possible that these periods can under any circumstances be materially abbreviated, they may, unquestionably, be prolonged in less favourable seasons, since I have myself had a fine queen hatched out so late as the twenty-first day.

Mr. Pettigrew also states that egg-laying "commences from six to ten days after impregnation takes place," whilst Huber and succeeding writers declare that it begins in forty-six hours. During my experience in breeding queens, I have, of course, had very numerous opportunities of observing them either on their actual return from a successful wedding flight, or immediately afterwards, and before the well-known sign of recent fecundation had disappeared, and I may at once state that in every instance I have invariably found that egg-laying commenced on the second day.

After perusing Mr. Pettigrew's book, however, I became desirous of making more exact observation on this point, and have accordingly watched eagerly from time to time during the present summer for evidences of recent fecundation in such young queens as I have reared; but fortune seemed against me, and it was not until about 3 o'clock p.m. on the 8th of this month (July) that I succeeded in detecting the looked-for appearance at the extremity of the abdomen of a young queen then just eight days old. Careful and frequent observations showed that no eggs were laid during the same or the next day, but at half-past eight in the morning of the day following (10th July), the discovery of a couple of eggs placed in cells at some distance apart, proved that oviposition had commenced well within the period of forty-six hours assigned by Huber.

I am satisfied also that Mr. Pettigrew is equally wrong on other points, which unfortunately do not, like the foregoing, admit of being readily put to the test of actual experiment.—A DEVONSHIRE BEE-KEEPER.

LARGE AND SMALL HIVES.

I COMMENCED this year with four hives. No. 1, A small straw skep with a hole at the top, of 1864. No. 2, A S. Swarton with two boxes, of 1865. No. 3, A wooden Woodbury hive, of 1868. No. 4, A straw Woodbury hive of May, 1869, the strongest of the four.

No. 1 commenced work in a super about the 20th of May, and has filled a good-sized glass and two good-sized boxes; but nothing that I could do would induce any of the other three to take to a super till the 8th of July, when the limes came into bloom, and all three took possession of their supers in great force. Up to that day I tried clean comb of last year, and new comb of this year with fresh honey in it, but all was in

vain. My conclusion is that the three hives were too large, and that, unless in very favourable situations, the smaller hive is likely to be more productive than the larger.—H.

NEW BOOK.

Home-made Wines: How to Make and Keep Them. By G. VINE. London: Groombridge & Sons.

This is a useful little book. The following extract will be the best evidence of its contents:—

"The following recipe to make ten gallons of rhubarb wine; or British champagne, will do for unripe grapes with their leaves, tops, and tendrils, currants, gooseberries, and similar sharp fruit, as well as for rhubarb, and will give a general idea of the proper mode of making a brisk wine. The time of fermenting, quantity of fruit, &c., must be modified somewhat in each case to suit the peculiarities of each fruit; for which directions will be given under their respective heads.

"Provide a fermenting tub that will hold from 15 to 20 gallons, or larger if required. It should have a guard or rim on the inside, similar to that used for brewing; beer, in order to keep back the husks of the fruit, and a tap near the bottom.

"Take 50 lbs. of rhubarb, and 37 lbs. of fine moist sugar. In the tub bruise the rhubarb; when done, add four gallons of water; let the whole be well stirred together; cover the tub with a cloth or blanket, and let the pulp stand for twenty-four hours; then draw off the liquor through the tap into another tub or pan; add one or two more gallons of water to the pulp, let it be well stirred, then allowed to remain an hour or two to settle, and then draw off; mix the two liquors together, and in it dissolve the sugar.

"Let the tub be made clean, and return the liquor to it, cover it with a blanket, and place it in a room, the temperature of which is not below 60° of Fahrenheit's thermometer; here it is to remain for twenty-four, forty-eight, or more hours, until there is an appearance of fermentation having begun, when it should be drawn off into a ten-gallon cask, as fine as possible, which cask must be filled up to the bung-hole with water, if there is not liquor enough; let it lean to one side a little, that it may discharge itself; if there is any liquor left in the tub not quite fine, pass it through flannel, and fill up with that instead of water. As the fermentation proceeds, and the liquor diminishes, it must be filled up daily, to encourage the fermentation, for ten or twelve days; it then becomes more moderate, when the bung should be put in, and a gimlet-hole made at the side of it, fitted with a spile; this spile should be taken out every two or three days, according to the state of the fermentation, for eight or ten days to allow some of the carbonic acid gas to escape. When this state is passed, the cask may be kept full by pouring a little liquor in at the vent-hole once a-week or ten days, for three or four weeks. This operation is performed at long intervals, of a month or more, till the end of December, when, on a fine frosty day, it should be drawn off from the lees as fine as possible; the turbid or muddy part passed through flannel. Make the cask clean, return the liquor to it, with one drachm of pure isinglass dissolved in a little water; stir the whole together, and put the bung in firmly. Choose a clear dry day in March for bottling. They should be champagne bottles—common wine bottles are not strong enough—secure the corks in a proper manner with wire, &c. The liquor is generally made up to two or three pints over the ten gallons, which is bottled for the purpose of filling the cask as it is wanted.

"To make a dry wine like sherry from the same kind of fruit, the cask must be kept constantly filled up to the bung-hole, daily, or every other day, as long as any fermentation is perceptible by applying the ear to the bung-hole; the bung may then be put in lightly for a time, before finally fixing it; it may be racked off on a fine day in December, and fined with isinglass as previously directed, and bottled in March."

OUR LETTER BOX.

FEEDING COCHIN-CHINAS (An Amateur).—Your food is not good enough. Do away with the pollard and Indian meal. Feed on ground oats, good heavy barley, a little Indian corn now and then for a change, and table scraps of every kind, crumbs of bread, &c. We are not friendly to any artificial food.

POULTRY-YARD ARRANGEMENTS (Constant Reader).—As a rule where fowls are kept no other poultry should be kept with them. The same management with your Turkeys probably has the same result. The hen is let loose too soon in the care of the chickens, or the hour of the day. A hen Turkey should not be at liberty till the poulters are seven or eight weeks old, and when that time has arrived she should not be at liberty till 10 A.M., when the sun is well up, and the grass is dry. Separate the Turkeys from the fowls; give the sickly ones green onion tops chopped fine, and mixed with meal, give them two pills of camphor daily, the size of horsebeans, and let their water be strongly impregnated with the same. If they are sinking you must give them some strong beer. We can only tell you how to combat the disease. If you tell us how you treat your birds, we will do our best to advise how to prevent it.

CHICKENS DYING WHOLESALVE (A Lover of Poultry).—Try some other plan of feeding. Either Mr. Wright's disagrees with them, or they get something besides his bill of fare. Do the yew trees drop any berries? If they do not, then the chickens get at something at times that is highly injurious, and causes these periodical and fatal attacks. We feed on bread and milk, chopped egg, crumbled bread and cheese curd, and

chopped scraps of meat. We give them beer to drink while they are not more than a month old, and we lose none.

HOUDAN CHICKENS ALMOST FEATHERLESS (J. H. C.).—Again let us observe that the best food is the cheapest. Sharps, fourths, middlings, bran, "chicken food," and all such appliances are as good for the chickens as a handful of sawdust each would be for a large family where the meat would not hold out. Adopt the dietary we have mentioned in our last answer. Wash the chicken that is suffering from inflammation with warm water and soap, dry it thoroughly, and then rub it with sulphur ointment. Your maggot-feeding probably helps to produce the disorder which arises from a heated system.

HOUDAN HEN HAVING A BROOD (Frances Anne).—We have never had a broody Houdan, but there is no rule without an exception, and we have known both Pencilled Hamburgs and Spanish to sit, and fulfil all the subsequent duties in a most satisfactory manner, as your Houdan hen is doing.

SNATH SHOW.—Messrs. Newbitt send the following as a correction of our prize list:—Spanish, first, H. Beldon; second, T. C. & E. Newbitt; third, C. W. Brierley. Jacobins, first and second, T. C. & E. Newbitt.

ANTS IN A HIVE (Miss P.).—The ascent of ants to a hive of bees may be prevented by nailing round the pedestal, a short distance from the ground, a bit of sheepskin with the wool outwards, and anointed with coal tar.

DWINDLED STOCK (A. O. L.).—Your stock has most probably dwindled owing to the death of its queen during the winter, and can now only be restored to prosperity by adding to it a new swarm.

BEEES IN AN OLD HIVE (A Sub.).—If you had expelled the remaining bees by driving at the oxidation of three weeks from the issue of the first swarm, little or no brood would have been found in the hive; whereas, at this time there is probably a considerable quantity. You may, however, now transfer them, combs and all, to a frame hive in the manner described in page 72 of our seventeenth volume, or you may drive and unite them to another stock in the autumn.

METEOROLOGICAL OBSERVATIONS

In the Suburbs of London for the week ending July 19th.

Table with columns: DATE, BAROMETER (Max., Min.), THERMOMETER (Air: Max., Min.; Earth: 1 ft., 2 ft.), Wind, Rain. Data for Wed. 13 to Tues. 19, and a Mean row.

- 13.—Overcast but fine; showery; clear and fine.
14.—Fine, cloudy; very fine; clear and very fine.
15.—Very fine; exceedingly fine and hot; fine.
16.—Very fine; fine, heavy clouds; clear.
17.—Very fine; cloudy, fine; densely overcast.
18.—Overcast; densely overcast; heavy clouds.
19.—Fine but overcast; fine; very fine and clear.

COVENT GARDEN MARKET.—JULY 20.

A VERY steady demand, and fair prices are realised for most of the goods now coming. Continental and Channel Island supplies continue heavy, and share the demand. Among the former are Peaches, Nuts, Apricots, Melons, Pears, and Apples. Potato trade is easier.

FRUIT.

Table listing prices for various fruits like Apples, Apricots, Cherries, Currants, Blackberries, Figs, Filberts, Cobs, Gooseberries, Grapes, Lemons, Melons, Mulberries, Nectarines, Oranges, Peaches, Pears, Pine Apples, Plums, Quinces, Raspberries, Strawberries, Walnuts.

VEGETABLES.

Table listing prices for various vegetables like Artichokes, Asparagus, Beans, Broad, Beet, Broccoli, Brussels Sprouts, Cabbage, Capsicums, Carrots, Cauliflower, Celery, Coleworts, Cucumbers, Pickling, Endive, Fennel, Garlic, Herbs, Horseradish, Leeks, Lettuce, Mushrooms, Mustard & Cress, Onions, Parsley, Parsnips, Peas, Potatoes, Kidney, Radishes, Rhubarb, Savoy, Sea-kale, Shallots, Spinach, Tomatoes, Turnips, Vegetable Marrows.

From observations taken near London during the last forty-three years, the average day temperature of the week is 75.4°, and its night temperature 50.4°. The greatest heat was 92°, on the 2nd, 1856; and the lowest cold 31°, on the 2nd, 1864. The greatest fall of rain was 1.39 inch.

CULTIVATION OF THE STRAWBERRY IN THE OPEN GROUND.

HAVING been for some years successful in the cultivation of the Strawberry out of doors, I will give the mode I adopt, by which a good crop is obtained every year almost with certainty. I shall first describe the way in which I grow the plants in the open ground without any protection; then the mode in which I have grown them in the open ground with protection, to forward the early crop.

I will, however, in the first place offer a few hints that will be found necessary to success. Never keep a barren plant; go over the rows as soon as they are well in bloom, and pull out all such plants. I am persuaded there are many failures from omitting to do this. Never dig amongst the plants, nor cut off the leaves at any time. If we wish to grow the Strawberry well we must bestow some attention on it; if it is cultivated on the starvation system of remaining three, four, or five years on the ground, how can one expect fine fruit? if every year a good crop can be produced of fruit fit for any table, either private or exhibition, by bestowing no more care than, if so much as, will have to be done to get a crop of good Celery, I think it is worth the trouble. I have this year gathered many fruit from British Queen, Lucas, Dr. Hogg, and President from 4 to 5½ inches in circumference off plants put out last September, many of these young plants producing from 1 to 1½ lb. the first year, and very heavy crops the second, though the fruit is then never so fine as on the young plants. Some sorts, such as Wizard of the North and Black Prince, I never again intend to cultivate longer than one year, for the quality of fruit from the young plants is much superior, many of the berries of Black Prince being 3 inches in circumference.

I will first describe the mode of taking the runners. Having at this time of year plenty of empty pots out of which bedding plants have been turned, I have as many washed clean as I require; any size from 3 to 5 inches in diameter will do. I then mix about equal parts of rotten dung (generally from an old Mushroom bed) and loam; this mixture is put through an inch sieve, and the rough part is used for crocking. The soil is pressed into the pots rather firmly, and a small peg, cut from old birch brooms during the winter, put into each pot: the pots are then watered, carried to the rows, and a runner pegged into each, generally the first runner from the plant. If the weather is dry they are watered a few times with a rose-watering pot, and the runners will be rooted in from twelve to sixteen days. I have 1100 that were layered on June 27th and 28th, taken off rooted on July 13th. They are then set on a hard walk in the full sun, each sort by itself, till the ground is at liberty for planting, which is often not till late in September.

The plants are then planted thus:—Supposing the ground has borne a crop of Onions or Peas, the usual way would be to trench it over, instead of which I dig out a

trench the depth of a spade and as wide, as for Celery; I put in 3 or 4 inches of good dung, return the soil, and tread it quite hard. I treat all the rows the same, making them 2 feet from each other, till I have as many rows as I require. The plants when turned out of the pots have a mass of roots, and are planted with a trowel at 18 inches apart in the rows, not making the hole too large, and are pressed in very firmly. If the weather is dry they are watered, otherwise they seldom have any water during the time they are on the ground. During the winter they are mulched with rotten dung from an old hotbed, if it can be spared—the two-year plants always.

I plant every year about half the plants intended to produce the main crop, say from 100 to 150 square yards, so that if one part of the bed should fail I never miss having a crop. For the last three hot summers the berries have been splendid; this I attribute to the firmness of the ground and the depth the roots go down. The hoe is used once or twice in spring to cut down weeds and to keep the fruit free from soil, &c., and a layer of clean straw is put between the rows just as the plants begin to show their flower stalks. After I have secured the runners I require, the rest are cut off, and cleared off along with the straw from the young plants; the other plants are done away with. No digging nor cutting off leaves is practised. I do not find any injurious effects arising from the runners being allowed to remain while the plants are fruiting, as I have taken as many as a dozen this year from young plants which have borne equally well with those which had the runners cut off.

I will now describe the mode of cultivating the Strawberry in the open ground, with protection to forward the early crop, by which this year I was enabled to ripen a good crop three weeks before the main crop was ready for use. Wanting some Strawberries last year early in June, and not having any plants in pots, I covered part of a bed of two-year-old plants with lights used for Vine and Peach borders during the winter. The plants did so well that I determined to make a bed specially for this year. The plants were turned out of pots late in September in ground that had borne a crop of Onions, a dressing of dung being trenched in, and at only 1 foot apart each way. I could not plant in trenches. They had a top-dressing of rotten dung about November, and were covered with lights on the 7th of March. The lights are 7 feet 9 inches long by 3 feet 6 inches wide, covering fourteen rows of plants, and forming a span-roof 15 feet wide, and 15 inches high in the centre.

It is a very simple affair, not taking more than an hour to construct; there are a few pegs driven into the ground, leaving them 15 inches clear above it; then some boards, 9 inches wide, which are used for shelves during the winter, are fastened to the pegs with two or three nails, and form the ridge. The bed slopes from north to south. The lights are put on the east side first, resting on the ridge, and those on the west side resting on them. A piece of slate is put under the ends of the lights to keep them off the ground, and a short peg is put in to keep them from shifting. Some thin boards are put to each end, not by

any means closely, and there is a span-roof 30 feet by 15 made in an hour. By varying the length of the pegs, it could be made higher if required.

The bed was made close to a walk 6 feet wide, so that in showery weather the lights could be taken off, which was done three or four times during April; they could be taken off and piled on the walk in less than five minutes by two men, and put on in the same time. I know well enough many gardeners are not so fortunate as to have lights to spare for a purpose of the kind. Were I to have the choice of the various patent plant-protectors, about which so much has been said, I should still prefer glass lights. These lights, of which there are upwards of seventy for covering Vine and Peach borders, answer extremely well for Vegetable Marrows and Tomatoes, by driving into the ground two stakes, such as are used for Dahlias, and resting two lights against them, as a child who was about to build a house of cards would do. Then rest each light on two bricks laid flat, and drive down a peg to each light to prevent its slipping off the bricks. Of course, the plants are put in first, four under each epan. By these means I secure an abundance of Vegetable Marrows and Tomatoes. The latter have plenty of fruit, some just showing colour, and the Vegetable Marrows I commenced to eat in the last week in June.

To return to the Strawberries. The lights were elevated on bricks laid flat as the plants began to grow and show flower, after another week they were put on edge, and by the time the plants were in full bloom they were put on end, two lights resting on one brick. The lights were entirely removed by the 15th of May. I only used twenty bricks, as there were eighteen lights. A few fruit were ripe during the last two days of May, and I gathered from the bed up to June 30th, 92½ lbs. of good fruit, some of Lucas 5 inches in circumference. I have since gathered 8½ lbs., making 101 lbs. There must have been fully 5 lbs. lost by birds and damp. The bed was never netted, and after the main crop was ready, which was June 25th, little notice was taken of the bed. The smallest quantity gathered at one time was half a pound. June 15th, 8½ lbs.; June 18th, 7½ lbs.; and June 21st, 15 lbs., were the largest quantities at one time. The sorts grown were—Black Prince, four rows; Filbert Pine, four rows; President, two rows; British Queen, one row; Lucas, one row; La Constante, one row; and Rivers's Eliza, one row. This was an experimental bed. The bed I am about to plant for early next year will consist of four rows of Filbert Pine, four of President, four of Lucas, two of Black Prince, and another of Dr. Hogg, British Queen, and President, with, perhaps, two rows of Lucas. This will be covered a month later than the first bed, which I hope to gather from by the middle of next May.

I will now add a few remarks respecting varieties, but only as regards my own experience, as they differ so much according to soil, situation, &c. I shall first name Lucas, President, Dr. Hogg, and Cockscomb. These four I procured two years ago next September, owing to the Rev. W. F. Radclyffe's having spoken so highly of them in the Journal. When I received the runners, fifty of each sort, they were very small and got beautifully less, till by spring I had only seven plants of Dr. Hogg, and not many of any of the others. I only had a few fruit last year, making runners the chief point. I obtained a good number of Dr. Hogg, many from President and Lucas, but Cockscomb was very shy, as it is this year also. Lucas has succeeded very well indeed under glass, the fruit being very large, fine-flavoured, and early, as it likewise was out of doors. It has one fault at present, which I hope to get rid of next year—I have had to pull out one-fifth of the plants on account of their being barren. President has proved a first-rate cropper, very large, of good flavour, and with no barren plants. Dr. Hogg has been very fine, producing many fruit, very large, and of first-rate flavour, but it has not borne so heavily as British Queen does on what might be called the trench system. Cockscomb I do not think so fine-flavoured as either of the others. With me it is not in full work yet, nearly half the plants I had being not true or barren. The largest fruit I had from it was 5½ inches in circumference. It is late. In addition to the above I have British Queen, Wonderful, Wizard of the North, Filbert Pine, Black Prince, Sir Charles Napier, La Constante, and Rivers's Eliza. British Queen is the best flavoured of the lot, produces splendid fruit and plenty of it, especially on the young plants. Berries 5½ inches in circumference are the largest I have had from it, but there were many of that size. Wonderful is a good cropper, many of the fruit being very large, particularly on the young plants. It does best in a wet season, and is of good flavour. Wizard of the North is a cer-

tain cropper; many of the plants planted last September must have borne more than a pound of fruit. It would take the place of Black Prince for kitchen purposes; the fruit is much finer, has a peculiar flavour, and is rather acid. Black Prince is too well known to need description, and is a sure cropper. Filbert Pine cannot be spoken of too highly; it comes into bearing as soon as Black Prince, is as prolific, continues bearing longer, and many of the fruit are very large; it is of first-rate flavour, and a certain cropper. I have grown it eight or nine years, and never knew it fail to produce a good crop; it is very robust, and makes plenty of runners. With it I superseded Keens' Seedling two years since, as it is in every respect superior to that well-known sort. La Constante, I think, is not true with me; the fruit is not large, as I sometimes hear of its being; it is only second-rate as regards crop, but is good flavoured. It did tolerably well under glass. Rivers's Eliza has never succeeded well here; I am doubtful if it is true. I shall only keep it another season if it do not improve. I am loath to part with it, as I see it is spoken very highly of at times. Sir Charles Napier is bearing well this year; it has been very barren. It is valuable for its lateness, only just coming into use; it is much like British Queen, but more acid. Sir Harry I grew two or three years, I could get nothing but leaves from it, and I have discarded it.—J. T. CREECH, Gardener to F. Swanwick, Esq., Whittington House, near Chesterfield.

AMONG THE SHOW ROSES.

GLAD WAS I WHEN

"The storms of wintry time had passed,
And one unbounded spring encircled all,"

For I purposed, though with fear and trembling, that the next Birmingham Exhibition of Roses should find me an exhibitor, and I knew that nothing but the hardest work and the closest attention would bring me the glory of success; and who would not strive for success in such a cause? So with a right good will I set my rosery in order, removed all superfluous wood, turned over all the soil, pruned where I thought the knife was needed, and, above all, manured heavily with thoroughly decayed horse dung. How I watched with growing anxiety day after day for the dreaded east wind, which, I gratefully add, never came, or came so lightly as to do no damage! How I looked forward with apprehension for the storms which usually visit our neighbourhood with levelling power each spring, and they also did not come! Then an anxious period, when the grubs were expected, and though they sprang into existence like magic, yet almost as suddenly did they disappear.

So far all was inspiring—no blighting winds scorching the foliage, no gales tearing the leaves from the wood and the wood from the stem; no insects to check the healthy growth of buds and foliage. From the beginning, therefore, until the drought checked the growth and forced the buds, circumstances stimulated me to labour with a cheerful heart from "early morn to dewy eve." But I had bedding stock to attend to as well as Roses, and my business likewise. So I overstrained my powers and fell sick. To recruit I went into Yorkshire, and then came the tropical heat of the latter part of June, filling me with anxiety about my Roses, as I feared they would be prematurely forced into flower. When I returned home ten days before the show, to my chagrin I found the Roses in full bloom—a heavy disappointment; it seemed that all my time and labour had been thrown away, for had I not trained for a race I could not enter? However, course soon revived when the glorious rain came, soaking deeply into the earth, and fresh buds made their appearance everywhere.

Our show was on Thursday, July 7th, and the Tuesday preceding it was a day which Mark Tapley might have pronounced jolly, but to me it was simply and downright miserable. The rain came down steadily and persistently for twelve hours, spoiling nearly all the expanded blooms upon which I was reckoning, besides spoiling my Moss hurt, which I had promised myself should be a kind of happy prelude to the show.

Well, I wandered through Satten Park till drenched to the skin, but I obtained a stock of pretty, compact Moss. The next day was hot and clear, and the rapidity with which buds expanded was marvellous. The eve of the show was spent in arranging the boxes, getting ready the labels, and taking careful stock of the best blooms.

The morning of the show, and of my first competition, I shall never forget. The days of my boyhood were back again with all their freshness and delight. The rising sun was

surely brighter, the air purer, the dew fresher than ever before, and, as I looked around me, beauty everywhere, and peace in my heart, I could not help repeating those exquisite lines of Wordsworth—

"God made the flowers to beautify
The earth, and cheer man's careful mood;
And he is happier who hath power
To gather wisdom from a flower,
And wake his heart in every hour
To pleasant gratitude."

But this is by the way. The business of the hour was to cut the best twenty-four Roses. That Rose which the Rev. S. Reynolda Hole says "is looking in at the window in every condition of life," was soon at my side deciding as to the merits of this bloom and that bloom, this combination of colours and that, and by 7 A.M. we had placed the better twelve blooms in one box, and the worse twelve in another. I thought it better to concentrate my strength in this manner rather than make each box equal, and the result proved I was right. Nearly all the Roses in my boxes had opened within thirty hours of my plucking them; they had, consequently, one very good quality—freshness. Friend Spencer (an enthusiastic roserian, for whom, by-the-by, a name-machine should be invented, for he can never remember the name of a Rose), popped over to see the boxes before they were closed, and he bade me be of good cheer. Then came the hasty breakfast, the short run by train to Birmingham, and for the first time I was elbowing the heroes of a hundred fights. Talk about the exhilarating, glorious vintage of Champagne! Why, I felt more exhilaration, of a pure and enduring nature, too, than could have been produced by the choicest champagne that ever was raised in *la belle France*. Alas, that she should have since let slip the dogs of war!

At 10.30 the Hall was cleared for the judges, and at 12 we were again admitted. Need I say that a rush, decorous as possible, but still an unmistakable rush, was made for the stand, and that my cup of joy was filled to overflowing when I gazed upon the card which announced that my Roses had gained a *first prize*! No wonder that for the remainder of the day the burden of my song was—

"What is fairer than a Rose?
What is sweeter?"

—C. W. M., *Wylie Green*.

THE BALSAM.

I AM very glad to see that in several gardens the old love for the Balsam is being rapidly revived. Gardeners find out that in order to get up a good floral display with as little trouble as possible the Balsam is one of the best plants they can grow. I find it is as useful as ever, and I think there are few things easier grown, or that will reward the cultivator with so much bloom according to the trouble of growing them. It is quite a summer and autumn decorative plant, and its cultivation is most conveniently commenced when bedding plants are cleared out.

The best plants I ever grew were nearly 4 feet high and some of them 3 feet through, and fully bloomed from bottom to top. The following was the treatment given:—The seed was sown in thumb-pots during the first week in May, two seeds in the centre of each pot in light sandy soil, and placed in a Melon frame at work. When up and the seed-leaves well developed, the weakest plant was taken away, and the other shifted into 60-sized or 3-inch pots; they were plunged and kept near the glass. Their next shift was into 48-sized or 5-inch pots; but while they were growing to this stage, preparations were being made for them to occupy a place to themselves—namely, a heap of spent hotbed and green manure in equal parts thrown together, well mixed, and heated almost to a blackness; a bed 3 feet high at back and 2 feet in front, and long enough to take six lights, or two three-light garden frames, was made up, the inside of the frames filled up to within a foot of the glass with decayed leaves, and when the whole became warm the plants were plunged into it, and in these places they were grown until they were coming into bloom, when they were taken into more airy quarters for their buds to open. In the early part of the time they are growing in these places an intermediate temperature must be maintained; give the plants plenty of light, at all times keep them near the glass, shift them into larger pots as they require it, and give them a rich soil composed of equal parts of turfy loam and rotten manure, with sand added, using the soil coarse as the plants increase in size.

In potting, let the plants down into the pots, so that the cotyledons, or seed leaves, shall be level with the soil. Attend well to watering, of which, when growing, the plants like an abundant supply and often, likewise sprinkling the foliage to keep the red spider in check. Turn the plants at regular intervals to keep the shoots equally balanced and the plants of good shape. If the plants do well they will throw out strong side shoots, and these in turn will throw out laterals. The first-named should be tied or pegged down as low as possible, and the latter kept properly staked-out, which will add much to the beauty of the plants. They will all flower. As the plants increase in size and height, the frames must be hoisted on blocks of wood or on bricks, and the air that is thus admitted under the plants will keep the foliage of the lower branches both strong and healthy. 16-sized or 8-inch pots will grow very fine plants, but 12's or even 8-sized pots may be used when extra-sized plants are wanted.

Soon after the last shift, or when the pots are filled with roots, a liberal top-dressing of rich manure should be given. In this the side branches will root vigorously, and if manure water be regularly applied, the plants will fully develop themselves. It is my practice, and I can recommend it, to pull off regularly the largest flower buds until every branch is regularly furnished with them; then let them flower, and the result will be such a mass of bloom as will, perhaps, surprise the cultivator himself.

After the plants have attained their full size and the pots are full of roots, water must be given most carefully, especially manure water; for if the soil becomes too wet, or the water not able to pass freely through the drainage, the plants are liable to rot off at the neck suddenly. It is now so easy to get seed that will produce a good percentage of double flowers that the old plan of proving the flower by first limiting the plants to small pots may be dispensed with. I generally grow Smith's packet of nine colours.—THOMAS RECORD, *Lillesden*.

MYOSOTIS DISSITIFLORA AND OTHER FORGET-ME-NOTS.

SOME discussion took place last year on the respective merits of *Myosotis dissitiflora* and others for spring decoration, the admirers of *M. dissitiflora* extolling it in terms which may fairly invite criticism, if it should fail to satisfy those who secured the plant for this season. I think those dissatisfied with it must be rather numerous, as the past winter has not been so favourable for plants of this class as the previous one; but the question arises, Has not this Forget-me-not been overpraised? In the few instances in which it is said to have done well, it has failed to meet the requirement it was expected to satisfy, "earliness of blooming," for it certainly has no advantage in this respect over another Forget-me-not that has been long known in this neighbourhood. Neither is it at any time, so far as I have observed, so pretty; the pink tinge of the early flower of *M. dissitiflora* in its early blooms is a disadvantage. Besides, it never forms such a neat, compact corymb as the common species, if I may so call the other, which, I may remark, seeds and grows freely enough, and its bloom forms a much neater auxiliary to the bouquet-maker than that of *M. dissitiflora*. In my own case, I must say I am disappointed with it, as I gave the plants I had the best position, and yet they did not flower so early as the common Forget-me-not, and at first the dirty pinkish hue was anything but agreeable. Latterly the flowers have improved in colour, and individually the pipes or blooms are a trifle larger than those of the common Forget-me-not, but, as before stated, too loose and disconnected to form a neat, compact head, and, taken individually, the petals or limbs of the corolla have too starchy an appearance, with less of that neatness which forms the principal charm of the Forget-me-not.

Other growers may be more successful than I have been, or it may have succeeded better in some places than here; but as I have not heard of any, and, besides, have heard of several failures, the inference would appear that it has been overpraised, as many useful things have been before it. Witness the flourish of trumpets which ushered in *Piumbago Larpentæ*, and where is it now to be found? *Viola cornuta* is better, but I imagine that those who planted their edging of this in March last have not received many compliments on its appearance, and yet, if two or three years in a place, it is very showy and a great acquisition.

I yet hope to see more made of the Forget-me-nots than has hitherto been done, but I can hardly believe in the number

of botanical species the names given would imply. I think there is room for improvers of florists' flowers to turn their attention to this genus, and if they can give us a hardy, compact-growing plant that flowers early, with blooms of a pretty blue with a buff eye, I would not care how small the individual flowers were, provided there were plenty of them to form a compact corymb. The later-flowering species or varieties, as *Myosotis azurea*, *coelestina*, and others, are pretty enough when they succeed well, but I have never been able to do anything with them. The season is generally too dry in this part of England at the time of their flowering for them to flourish, and, as there is no lack of blue flowers at the time, they are not so much wanted as earlier-flowering sorts.

The poetic associations of the plant will always entitle it to a place in gardens, but that place will be higher when improvement is carried a little further than it has yet been. The Lily of the Valley is a name equally venerated, yet the improved garden variety is quite as great a favourite as the wild one; and the interest taken in the Forget-me-not will not be lost when it is made to conform more to the requirements of a flower-garden plant, and if it can be induced to bloom somewhat earlier its value will be much increased. In colour it is far behind *Nemophila insignis* and some other plants. I remember one season having a quantity of Forget-me-not occupying two circular beds 10 or 12 feet in diameter, and in a line with them in a certain direction were beds of *Nemophila*, and further on some two-year-old edgings of the best variety of *Viola corouta*. In taking a view of all three from a distance of 50 or 100 yards, most persons pronounced in favour of the *Nemophila*, but as the latter is not to be depended on in severe winters, I would prefer a good hardy Forget-me-not if it could be obtained. From what I have seen here and elsewhere, *Myosotis dissitiflora* falls short of meeting the requirements needed in a spring-flowering plant. If others have been more successful with it, I shall be pleased to hear the particulars; only, if a plant requires special treatment of an inconvenient or labour-giving kind, it comes to me with a certain drawback; therefore, unless the propagation and culture of a *Myosotis* can be made as speedy and as easy as that of a Primrose, the plant loses much of its value, and something else must be substituted for it. Let us see if a few years cannot make as great an improvement on the *Myosotis* as was done in the case of the *Pelargonium*; certainly there is ample room.—J. RONSON.

FORMING A FLOWER GARDEN.—No. 3. ARRANGEMENT OF THE PLANTS.

The arrangement of the plants in the flower garden is a work full of interest, and a person to be successful should possess a thorough knowledge of the laws of colours, as well as skill, experience, and, above all, a natural taste and liking for the work. In a paper written by me on another subject, yet bearing somewhat on this, in stating the principles which should guide us in the arrangement of the colours in a flower garden, I considered "breadth of colouring without heaviness, brightness, cheerfulness, distinctness without gaudiness, variety without confusion, and the harmonious blending of the whole design," to be the most important points to be remembered. One colour should predominate just sufficiently to impart its peculiar tone to the whole design. Great caution must be exercised in deciding upon the number and position of the beds to be filled with this colour or its shades, for if there be an overwhelming preponderance of it, heaviness or glare will be the inevitable result. I have seen gardens in which some of the beds were really well planted, and the arrangement good and pleasing, but the effect was quite spoiled by some large masses of scarlet and yellow, so glaring as at once to attract the eye, and "kill" every other colour in their immediate neighbourhood.

Taking the centre of the garden as our starting point, the colouring here should be more massive in its character than at any other part. A deep scarlet flower, as *Stella Pelargonium*, or a rich crimson leaf, as *Coleus Verschaffelti*, is best adapted for such a position. A quantity of either of these sterling bedding plants grouped together in correct proportion to the size of the entire garden produces a rich, bold, and striking effect without any approach to vulgarity; and while they impart the requisite importance to the centre of the design, they form an excellent groundwork for other colours. An edging of pale yellow or grey might be formed around such a central group, but much subdivision of this or of any of the beds is to be avoided.

Neutral colours, such as soft grey or lavender, skilfully introduced, serve to divide and act as foils to the brighter colours. By way of example, I may mention a bed planted with Purple King Verbena in the centre, with an edging of *Manglesii Pelargonium*, the pink blossom of *Manglesii* being kept picked off, and another containing a mixture of *Perilla* pegged closely, and either *Parfum de Madeleine* or *Mrs. Mole Verbena*. The latter was designed by a lady, and is one of the best neutral mixtures I have ever seen. The position of such beds is a matter requiring much care, for when present in the slightest excess these colours impart an insipid tone quite as hurtful to the general effect as a preponderance of any other colour. The position of foil beds in gardens of large size is usually about midway between the centre of the garden and its boundaries, for as the rich colours of the key bed are usually repeated in smaller quantities in some of the outer beds, it is quite obvious that these neutral tints will be most effective in an intermediate position. Masses of bright colours in the outside beds serve to maintain an even balance in the colouring, and by attracting the eye cause the whole design to appear more expansive than colours of a quieter tone would do.

Of the colours requiring particular care in their use, yellow may be said to be the most important; a few masses of a bright yellow, such as we have in *Calceolaria Aurea floribunda*, judiciously introduced, light up and brighten a design with the best possible effect. If the beds are small, such masses are, I think, best seen pure and simple, surrounded only by the turf; but if a border or edging be used, it should certainly be of some complementary colour, such as a dark *Heliotrope*, or deep blue *Lobelia*, or a crimson *Iresine*. It may be useful to repeat the axiom here, that two colours placed in juxtaposition mutually influence each other. But while we recognise the importance of a knowledge of the laws of colours to render a person competent for this work, it will, I think, be granted that in the flower garden some modification of these laws may be allowed. Many instances might be adduced in which they have been broken with impunity. Green and blue are discordant, yet how frequently do we see broad lines of *Lobelia speciosa* next turf. It must be owned that a row of *Cerastium*, however narrow, outside the *Lobelia* is undoubtedly best, but then we may not always use it, and while the *Lobelia* is intensely blue, the turf more frequently approaches a brown, and I would rather have blue next the turf than render the garden insipid by planting too much grey. Again in purples, if we form a mass of Purple King Verbena without any other colour intervening between it and the turf, its effect is not weakened, because we have masses of its complementaries of yellow, pink, or white near it.

Another important point is the introduction of shades of the same colour; this applies especially to the multitudinous varieties of bedding *Pelargoniums*. If two of one colour are planted side by side, the brighter is certain to spoil the effect of its neighbour, and so it is best to select colours sufficiently distinct from each other to be really effective. This caution may also well be applied to novelties; it is quite useless to depend on the description given in the catalogues, and if the purchaser has not seen them planted out, it is always the safer plan to give them one season in the trial border before venturing to introduce them into the flower garden, where the planting should not be of a speculative character, but with varieties the merits of which have been fully tested.

ACCESSORIES AND SURROUNDING FEATURES.

The manner in which the appearance of masses of bright colour is affected by surrounding objects, does not appear to be so fully recognised as it ought to be.

The approach to the flowers should wind amongst the shrubs, under the shade of trees, or past green lawns, so that the eye, soothed and rested, may be prepared to enjoy the full beauty of the flowers. The approach to the terrace garden at Surrenden-Dering, designed by Mr. Nesfield, is very masterly. A broad, winding, gravel walk, having a belt of shrubs on one side, and a lawn on which are some fine old Cedars and other trees of a large size on the other, leads to a flight of stone steps, from the top of which there is seen on the one hand a broad expanse of turf, and on the other a glimpse of the flowers is obtained. Ascending another flight of steps a broad terrace-walk is gained, and from this elevated position, in a direct line with the centre of the design, the whole of the flower garden is visible, and the beholder is not only in the best possible position to enjoy its full beauty, but from this fine stand-point, if the colouring is good and the beds well filled,

the flower garden is displayed in the most favourable manner, and none of its finest features is lost. In contrast to this, I may instance another case where a fine walk passing through grounds of great extent, past handsome shrubs, and under noble trees, leads to a small flower garden of such puny dimensions as to be out of all proportion to its surroundings; but what tends more than anything else to completely spoil the entire effect is, that one corner of the design becomes visible first, and, consequently, a sort of diagonal view across the beds is all that this fine walk commands, and the impression conveyed to the mind is one of disappointment.

Another important feature is the position of the shrubs near it; many gardens are enclosed by a belt of shrubs, and these, by the exercise of a little care in planting, and in their after-management, contribute very much to the general effect. In such a belt the two front rows should be planted in quinconx—that is, every shrub in one line should be opposite the space between two plants in the other; they should also be far enough apart and well back from the beds to admit of their gradual formation into fine handsome specimens. These shrubs should not possess variegated foliage, but should be of a deep green. Of all hardy shrubs I know none to equal the Portugal Laurel for such a position; the handsome outline and deep hue of its foliage, and the ease with which the finest proportions may be imparted to it by the use of the pruning-knife alone—all tend to recommend it as the best shrub to use for this purpose. The common Laurel may have its admirers, but I think if a fair comparison of the two kinds be made, the deeper colour of the foliage, and the more elegant growth of the Portugal Laurel will cause it to find favour with the majority.

With regard to the introduction of Roses into the flower garden, while objecting to their use in such quantities as would influence or affect the colouring of the design, it is by no means intended to assert that some may not be used, and that with the happiest effect in certain instances. I can remember one such, where a small flower garden was laid out on a somewhat confined lawn, shut in by walls on three sides, and with the residence on the fourth. Now, the wall opposite the house was a low unsightly object with a public road close outside; and to conceal the wall and obtain a higher screen a row of shrubs was planted close to its inner side. This had the desired effect; but as there was only space for one line of shrubs, its aspect was that of a formal hedge. To break up this stiff outline, a double line of dwarf conical Rose trees planted thinly produced a pleasing effect; the handsome form of the plants tapering upwards from the turf, with their clusters of flowers, instead of detracting aught from the design, contributed materially to its finish and beauty.

Vases are almost always out of place in a flower garden; in fact, it may be stated broadly that nothing should be introduced into the garden itself, in its surroundings, or in the approach to it, but what is so quiet in tone and appearance as to make it entirely subordinate to the garden itself. One other word as to the garden seats. These should be of a simple but elegant form, and painted of a quiet neutral tint. Nothing can possibly be in worse taste than the lively green colour but too often visible on such seats.—EDWARD LUCKHURST, *Egerton House Gardens, Kent.*

CALADIUM ESCULENTUM AS A VEGETABLE.

TRAVELLING north through Philadelphia last summer, I noticed in the gardens, grown as an ornamental plant, our common Tanyah (*Caladium esculentum*). I had no idea it would thrive so well so far north. The leaves were not nearly so large as we have them here sometimes, for I have seen them in favourable localities 3 feet long, and at least 2 feet wide. Here we use it as a vegetable, and think it excellent washed and roasted, as Potatoes are sometimes, with the skins on.

When living in the north many years ago, we used to dig up in woods roots called Indian Turnips, and bake them in ashes which we made by kindling a fire in the woods. The root of this plant tastes very much like those Indian Turnips, which will give a good idea of them to those who have no knowledge of them.

A rich, wet soil, seems to suit them best. In this they furnish one big root and make many offsets in the manner of the common Tuberose, which side shoots make the sprouts for the next year's crop. Besides this, the roots can be more rapidly increased by dividing them into four, and perhaps more, as you would do a Rhubarb root.

I am told by a friend, that plants can be raised from the leaves, the leafstalks rooting in warm, wet soil, but of this I have no knowledge of my own. I think if you were to try that as a vegetable crop in your gardens, it might add one more to the many pleasant table dishes I so much enjoyed in my last summer's trip.—(*American Gardener's Monthly*)

ROKEFORD FITZPAINE.

I FEEL confident that the name of my kind and valued friend Mr. Radclyffe is so well known, and his opinion on those points of horticulture which he makes his special study so much valued, that a slight record of my annual visit will be acceptable to the readers of the Journal. Many will like to know how he has fared in this strange season, and whether the opinions he has advanced and the diets he has laid down have been in any way altered by the experience of the present year.

It has probably been thought by many who have read his enthusiastic remarks on the Rose, that he is revelling in some rich, nutritious, loamy soil, such as makes Rose-growing in Hertfordshire a comparatively easy matter; but I have endeavoured always to correct this notion. His soil is anything but a congenial one, and were it not for his use of the Manetti, and his excessive attention to the wants of his Roses at all seasons, he could not possibly succeed. I do not believe the Briar would do at all there, and where that is the case I need not say it cannot be said to be a good Rose soil. Then, again, he lacks the shelter in some parts of the garden that the Rose ought to have, provided that shelter be not caused by overhanging trees; as I have before explained, a great part of the garden lies open to the S.W. wind, the prevailing wind here, and which sweeps into it with the force of a hurricane, so that his canvas covering for his Peach trees has been often torn to shreds, and once, as we know, his brick wall was blown down.

I did not come here at this date (July 15th), to see Roses, for I knew from my own garden that was out of the question; indeed, the first bloom of Roses must be generally over by now, and we are on the look-out for those fine long shoots and that fresh growth of young wood which will give us good blooms in August and September. The French term *remontant* is much more expressive of their character than Hybrid Perpetual; they are not perpetual, but they do what no summer Rose does—throw out fresh shoots and give a second blooming season. But I came to see the Rose trees, and certainly no one could look at the *debris* of Roses on the bushes, the immense and overflowing clusters of dead blooms, and fail to lament not having been to see them in their beauty—no symptoms of the effects of drought, but everything in the most vigorous state. As to the yellows, it is impossible to conceive anything more vigorous. *Triomphe de Reims* is a marvel of beauty. There were six plants of this flower in front of the greenhouse and three of *Isabella Gray*, which formed a complete hedge—shoots, fresh shoots 4 and 5 feet long, with great clusters of blooms at the head of them, while hundreds had died away. *Isabella Gray* is too hard-hearted to display her charms, and so with a true Henry VIII. short and easy method Mr. Radclyffe is going to have her head off and bud *Maréchal Niel*, which is doubtless one of her own children, on her decapitated trunk. He is no admirer of novelties, "varieties without variation," as he styles them, so that they are not to be seen here in great quantities, but when he does get a novelty that he likes he goes in for it with a vengeance. He has lately highly extolled *Felix Genero*, and although my friend Mr. Peach does not agree with him, I (if Mr. Peach will allow me to be anything of a judge), think that the balance lies with Mr. Radclyffe. It is a good Rose in my opinion. Its shape is admirable, notwithstanding the row of outer petals being often small; its colour is not red, but a lilac rose; and it is a free and good bloomer. As to the test which Mr. Peach would submit it to, I fancy very few Roses would stand that—certainly Charles Lefebvre and Baroness de Rothschild would not, yet would Mr. Peach discard these? Now, so convinced is Mr. Radclyffe of *Felix Genero* being a good Rose, that he is going in for fifty of it. And this is the way which he adopts with really good Roses. Charles Lefebvre and Jules Margottin are to be seen by hundreds, and Comtesse de Chabillant, John Hopper, and others by dozens. He is equally determined in his proceedings when a Rose disappoints him. Mlle. Marie Girodte was highly recommended to him; he bought a dozen, but she is a "*trout rien*," and so off she goes this season. He, however, retains some kinds that others have discarded, such as *Duc de Cazes* and *Sonvenir*

de Dr. Jamain, and I think he is right; but as I mean to have a say on "some discarded Roses" by-and-by, I will add no more on this point. All over his garden the queen asserts her authority; it is "Roses, Roses, Roses everywhere"—on the front of his house, on the sides thereof, on the pretty bank at its back, in the rosarium proper, along the walks of his kitchen garden in double tiers: so that I do not wonder to hear that so many of all ranks and classes, admitted by his genial kindness to see his garden from far and near, have expressed their delight at the prospect.

Strawberries are another feature of Mr. Radclyffe's gardening, and probably nothing could more thoroughly testify his skill than their appearance at this season. Loud have been the complaints of deficiency of supply and smallness of the fruit, but such complaints find no echo here. I have never seen (I say it advisedly), such plants and such crops; for although I am here at the end of the season, the size and excellence of the Strawberries are something wonderful. As Mr. Radclyffe has, however, himself written on this subject, I can do no more than corroborate his views from personal survey. Mr. Radclyffe he regards as the finest-fleshed and finest-flavoured Strawberry. Dr. Hogg comes next in his estimation, and for general growth he advises it in preference to Mr. Radclyffe. Rivers's Eliza comes next, then John Powell; and for size and preserving, Cockscob and Wonderful.

This season is in general a good one for wall fruit, but I very much question if anywhere a more regular crop is to be seen than on the small trees which now cover Mr. Radclyffe's wall. He has had them now planted three or four years, and he might by this time, had he so liked, have covered the entire space with a few trees; but he prefers variety, and so has about 108, which he keeps within bounds by a judicious system of pinching. He does not allow them in a season like this to crop heavily, preferring fine fruits to a quantity of indifferent ones. There is no blistering on the leaves, and but little symptom of that pest red spider. In fact, going all over his garden, you could hardly imagine that we were in the midst of one of the most trying seasons on record.

Mr. Radclyffe, like myself, is pretty well tired out of Potato trials, and, although he has several new varieties growing in his garden, is determined for the future to cling to those he has already proved to be good. "Early ripener and late keepers" is his motto, and such sorts as the Old Ashleaf, Rivers's Royal Ashleaf, Cobbler's Lapstone, Taylor's Hybrid, and Yorkshire Hero seem to be all that he requires. Of the American sorts he has no opinion, and a Potato tournament he cannot see the value of. I confess I agree with him in this. Of what use is the best-looking Potato in the world if it is not a good one for eating? and some of the very prettiest Potatoes and largest croppers are in this predicament—for example, Premier and Prince of Wales; and I am afraid, if the judges were to be called upon to taste, so many are the varieties, that they would be like the celebrated wine committee, which at last ordered port instead of sherry, and sherry instead of port. A good Potato will, like the Lapstone, win its way, and all the Potato tournaments in the world will not help it on if it be indifferent.

What, then, is the secret? "Water." If with the Manchester school "Cotton is king;" if with the politician "Register! Register!" is the cry; so with my friend, Water is king. He has had two men constantly watering; and everything—Roses, Strawberries, Peaches, and Nectarines—has been well saturated; and this, with his rational common-sense method of doing things, secures him that success which often great theorists and would-be philosophers never attain to. I should add that "Sleeve" is as dry as ever, as thoroughly as ever believes in his master, is as laborious and painstaking as a man can well be, and does his best to maintain the credit of the famous garden he has to manage.—D., Deal.

SOFT SOAP AS AN INSECT DESTROYER.

ABOUT 1855 I was growing a few Dahlias, and soon after they were planted out they were nearly destroyed by the fly. In a bucket nearly full of water I mixed some soft soap, and taking some of the water in my hand I drew it up each shoot, commencing at the bottom, wetting the under as well as the upper sides of the leaves. There was not a fly to be seen next day. Seeing the effect on the Dahlia, I tried the experiment on Roses with the same result, but the improved appearance of the foliage surpassed that of the Dahlia. In applying the water to the Rose I take the end of the shoot in the left hand, and

with the right throw the water on, or hold the shoot over the bucket and wet the foliage well without wasting much water.

About nine years ago I put up a greenhouse, and grow a few Pelargoniums, Fuchsias, herbaceous Calceolarias, Cinerarias, and some other plants, but those I have named I found most subject to insect attacks. My house was glazed with rather small squares of glass, and was, therefore, not very easy to fumigate effectually. I nearly filled a large pail with water, mixed some soft soap with the water, and when any of the plants were attacked by aphid I took the pot in my right hand, placed my left hand on the soil to keep it from falling out of the pot, turned the plant upside down, and ducked it in the water. At the end of two years, when the solution was accidentally upset, it was as effectual as on the day it was prepared.

There appears to be some doubt about the proper weight of soft soap to use to a gallon of water. I always mix the soap in warm water first, taking care to leave none undissolved. A little soap will do no harm to any of the plants I have named, will kill the fly, and, especially in the case of Roses, will improve the beauty of the foliage. Of course greenhouse plants are only dipped when out of bloom, but doing so beforehand is a preventive of insects.

I have never had occasion to use soft soap to my Dahlias since 1865, but the Roses have required a dressing or two every year. As it seems to improve the foliage, I have applied the soft soap even when the fly has not made its appearance. I have scarcely known what mildew meant, and this year, although so hot and dry, I have not seen an aphid on the Rose. As I have been very busy, the plants were so clean, and the blooms the best I have ever had, the customary bath was not given, and now I have not a Rose on the Manetti or its own roots which is not white with mildew. Those on the Briar at present are all right.—J. C. H., Moorgate Grove, Rotherham.

THE ROYAL HORTICULTURAL SOCIETY'S OXFORD SHOW.

(Continued from page 47.)

VEGETABLES.

OF these, considering that there were only five classes, and these necessarily very limited, in which vegetables could be exhibited, the exhibition may be said to have been good, most of the articles being of very fair quality. Peas and Potatoes were well shown. These, however, were the only special subjects asked for. We should like to see vegetables generally better recognised at our provincial shows, and greater encouragement given to their cultivation. It may be that they have not such an ornamental appearance as fruit on the exhibition tables, and are not quite so attractive to the general sight-seer; still, being by far the most important products of a provincial garden, and their cultivation the most important of a gardener's duties—seeing, also, that the cultivation of vegetables is not what it should be, and that the rising race of gardeners are somewhat inclined to look down upon this department as derogatory, we think that the Royal Horticultural Society, which professes to hold its meetings for the encouragement of cultivation, would do well to make good vegetables a greater feature in their provincial exhibitions.

The prize given by W. Muntton, Esq., for the best nine dishes or baskets of vegetables, was awarded to Mr. George Craddock, gardener to Lord Willoughby de Broke, Compton Verney. In this there were excellent Cauliflowers, Parsnips, Peas, Globe Artichokes, Beet, Italian Red Onions, Prince of Wales Potatoes, good Tomatoes, and Cucumbers. Mr. Miles, gardener to Lord Carrington, was placed second, and Mr. Perkins, gardener to the Earl of Hartismere, Eye, Suffolk, third; the second prize being given by the *Oxford Journal*, and the third by W. Muntton, Esq. Mr. Broadbridge and Mr. Henwood, gardener to M. H. Turnbull, Esq., also competed with good collections. The Cauliflowers were throughout much finer than we could have expected to find them.

For the best three baskets of Round and ditto Kidney Potatoes, the prizes given by Messrs. Hall & Co., the competition in each class was keen, thirteen collections being set up. The first prize in both instances was awarded to Mr. Craddock, gardener to Lord Willoughby de Broke, the specimens being clean and well grown. The second prize for Round Potatoes went to Mr. Henry Miuchin, Hook Norton; the third to Messrs. Bell & Thorpe; and the fourth to Mr. Earley, Digswell. In the class for Kidneys Mr. Miles was placed second, Mr. Earley third, and Mr. D. Gammon fourth. For six dishes of Peas, "preference being given to collections containing Fortyfold and Miltum-in-parvo," the prizes being given by Messrs. Nutting & Sons, Mr. Simmons, Union, Thame, was placed first with very fine examples of McLean's Wonderful, Miltum-in-parvo, Premier, Fortyfold, Veitch's Perfection, and Berkshire Hero. Mr. J. Walker was placed second. In the class for three half pecks of Peas, one variety, the prize being given by Mr. David Day, some confusion seemed to exist as to whether it was intended for three half pecks of one variety, or for three half

pecks—half a peck of one variety. The prize was given to the three half pecks, distinct varieties, exhibited by Mr. Maunders, gardener to the Earl of Abingdon, Wytham Abbey—viz., British Queen, General Wyncham, and Ne plus Ultra, all of which were very excellent examples, the pods fine, long, full, and fresh. Mr. J. Perkins was placed second, and Mr. F. Sims, Marston, Oxford, third. There were no less than seventeen competitors in this class, and all the collections were creditable. Layton's Supreme, Ne plus Ultra, Premier, Veitch's Perfection, Champion of England, &c., were amongst the most noticeable of the other varieties exhibited.

Though not strictly coming under the head of vegetables, we may here add that Messrs. Sutton & Sons, of Reading, had in the Agricultural Show Ground a large and very complete collection of Grasses, seeds, roots, &c., and Messrs. Carter & Co. had a similar collection.

HORTICULTURAL APPLIANCES, IMPLEMENTS, STRUCTURES, &c.

This department of the Exhibition was very meagre—meagre as to extent and meagre as to quality. As to the implements and a great portion of the appliances or useful articles applicable to horticulture, a better selection could be obtained by turning out the interior of any ordinary ironmonger's shop. As to structures also, with a few exceptions, we can say but little. In this special department, indeed, specially pertaining to the garden, the exhibition in the yard of the Agricultural Society was infinitely superior, more varied, and more extensive, the exhibitors thus finding it more to their interest to exhibit at the great gathering than at the little show. Mr. Beard, of Bury St. Edmunds, exhibited some of his patent glass walls, which are to be used instead of brick. The glass used is common rough plate in large squares, set on edge, and fixed in grooves in upright iron pillars. They have a very light, elegant, and pretty appearance, take up but little space, and are thus recommendable for small gardens. They will provide shelter for the plants trained against them, but cannot in any way compete with brick walls in a horticultural sense.

Mr. Ormson, of Chelsea, exhibited several forms of wrought-iron boilers, which seem to be of a very powerful character, also drawings and designs for hothouses, &c. Mr. Ormson further exhibited models of his new patent ventilating hot-water apparatus, which appears meritorious, the cold air being admitted into the centre of a cylinder heated by four pipes, which are cast in one piece with the cylinder; combined with this, the rafters are made hollow and faced with perforated zinc, whereby all stagnant and vitiated air is carried off by ventilators in the back wall, and which can be regulated at pleasure. As a means of ventilating in winter this method of Mr. Ormson's is, we think, very excellent. The glass used by Mr. Ormson is of immense thickness, being what is known as 32-oz., and is fixed in grooves, thus doing away with front putty, which is always expensive to keep in repair.

Messrs. Weeks & Co. exhibited models of greenhouses, &c., and of their well-known upright tubular boilers, one of which is further altered by being made in two halves, either of which may be used whilst the other is being repaired. Mr. Rendle exhibited numerous examples of his patent plant-protectors, ground vinerias, &c. Mr. Leoker had also his patent propagating boxes and other ingenious contrivances for the cultivation and propagation of little things. These may be all very useful in their way, especially to amateurs. Mr. James Cranston, Birmingham, had examples of his patent greenhouses, which have the merit of being very ornamental.

From Messrs. T. H. P. Dennis & Co. we have a novelty in Gilbey's patent glass orchard, represented in the accompanying engravings. It is at least ingenious and simple, and also neat in appearance. We cannot say, however, that we should expect great results from it. The same firm also exhibited two strong lean-to houses, the sashes and sashbars being made of galvanised iron; these had a light and elegant appearance. They had also examples of their square tubular boiler. Mr. P. J. Perry, of Banbury, had a model of what is very modestly styled "The Improved Peach House," a lean-to, the glass being in large squares, and fixed with strips of flat lead instead of putty. Messrs. Messenger, of Loughborough, exhibited a structure invented and patented by Mr. Ayres, of Nottingham. This is called the "Imperishable Hothouse," and so far it is almost worthy of the title. The glass itself will not perish, and the glass is held in its place by small clips of brass or other material, which will likewise not perish. The house consists of a mere framework of rafters and mullions, placed from 6 to 8 feet apart, and connected together by cross pieces of iron or wood at such distances apart as may be required to take the glass, which is laid on in much the same way as tiles on the roof of a house, and held fast by the clips as before stated. We have some objection to the lapping-over of the glass at the sides, otherwise we consider this a decided move forward in horticultural structures. The outside being all glass, no painting whatever is required, and what a wonderful

saving this must be!

Messrs. Green & Son had some of their most excellent lawn mowers on view; and the new Archimedean was shown by Messrs. Gill & Co., of Oxford, besides a great variety of minor articles. Messrs. Dick Radclyffe & Co. had some mowing machines and other articles on view; and Messrs. Haynes & Sons had a large stand of their patent hydromettes, which are too "squirty" in their action to meet with much approval. There were, besides, Appley's and Drechsler's fumigators, neat wire flower baskets, and various other articles in wire-work, from Mr. Holliday, of Notting Hill, as well as many other things of a miscellaneous character.

PLAN OF A QUARTER ACRE

THE GENERAL MEETING AND HORTICULTURAL CONGRESS.

At the General Meeting, held on the 20th, G. F. Wilson, Esq., F.R.S., was in the chair. After the usual preliminary business several new Fellows were elected. The only object of special interest not before reported upon, was *Macadamia ternifolia*, of which Dr. Masters exhibited the nuts, which were too late to be submitted to the Fruit Committee. These nuts were

stated to be fully equal to Filberts in flavour, and were accompanied by the following remarks from Dr. Hooker:—

"A year ago I received from Australia ripe seeds of the *Macadamia ternifolia*, for the garden, and happening to taste one, I found it to be so excellent in texture and flavour that I at once wrote to my friend, Mr. Hill, of the Brisbane Botanic Garden, to send me a supply for trial as a dessert fruit. The box has now arrived, and Mr. Hill requests me to forward a sample to the Scientific Committee for an opinion, which I now do. I should add that, the box having been delayed considerably in transmission, some of the nuts have deteriorated in consequence.—J. D. HOOKER."

THE HORTICULTURAL CONGRESS commenced on the 20th inst., was presided over on that day by G. F. Wilson, Esq., and was well attended. Dr. Voelcker opened it with a lecture on "The Principles of Manuring." He was glad, he said, to have the opportunity of imparting in-

formation to the horticulturist, although hardly knowing in what manner to treat the subject, for the simple reason that the horticulturist was far in advance of any theory that could be laid down to regulate his proceedings. The agriculturist, on the other hand, was far behind the horticulturist in practice, though well aware of some of the great principles which should guide him in the application of manures. It was within the agriculturist's power to increase the crop in an average season by the judicious application of farmyard manure, and in the event of the supply of dung running short, he could apply artificial manures in certain proportions which experience had shown would produce a particular effect on the crop. The farmer, by experiment, had learnt precisely what to do in order to attain his object—when to give a supply of manure, and when to withhold it, and he also knew what particular kinds of manure were useful at certain stages of growth, and when to withhold them. A gardener, as a rule [no, no], could command any amount of stable manure, whilst the agriculturist was not in such a favourable position, being often compelled by the force of circumstances to eke out his deficiency by using certain artificial manures, generally expensive even when applied in the best manner. Dr. Voelcker then said he would arrange his remarks under the following heads:—First, The nature of the organic and mineral food of plants; secondly, the properties of ordinary stable manure and artificial manures; thirdly, the time of application; and fourthly, the fertilising combination and the special uses and effects of manures.

In the first place, in reference to nitrogen, he considered a supply of it necessary to growing plants. This was one of the questions upon which there is a good deal of dispute among scientific men. Nitrogen was not absorbed by plants directly from the atmosphere, which, however, contains small quantities of ammonia, which are absorbed by a porous soil or by rain, rain carrying with it at the same time small quantities of nitric acid. He would, therefore, to insure the healthy and luxuriant growth of garden plants, make use of nitrogenous manures. Then the question would arise, In what form was this nitrogenous food best supplied to plants? He would supply it in the shape of ordinary dung, in which it is to be found as a nitrogenous substance in a progressive state of decomposition, partly as ammonia, and partly in the form of nitric acid. Mineral manure, which could only be derived from the soil, was not only essential to the existence of plants, but absolutely necessary for the luxuriant development of every kind of produce. In this sense lime was as important as potash, sulphuric acid as phosphoric, soluble silica as any other mineral composition which entered into plants. There were certain matters spread throughout the soil that occurred in very small quantities, while others were of more abundant distribution. The alkalis, potash more especially, on some descriptions of land were more sparsely distributed than the corresponding soda or magnesia. Then, as to the combinations on which plants feed, nitrogen is always present in great variety, so that if in one form it fails to exert its beneficial influence, it will be sure to do it in another, and this is of great practical advantage. Sulphate of ammonia and nitrate of soda are especially useful to the growing plant; but if applied at the wrong time they are very dangerous. Experiments had been carried on in Germany during the last four or five years with plants which ordinarily grow on arable land, and which had been successfully cultivated in various solutions, but if the solution was too strong the development of the plants was greatly interfered with. Great care should be exercised in using manures which are quick in their action, and he questioned whether they should be used at all, but he would recommend good top-dressings. If good results were to be secured from the application of phosphoric acid, potash, ammonia, and nitrates for horticultural purposes, these ought to be mixed with a large mass of soil, and used in the form of a compost. He was of opinion that manure could not be applied too early in autumn, and if thoroughly mixed with the soil it entered into a great variety of combinations favourable to the growth of plants. All soils possessed the remarkable property of fixing some of the more fertilising ingredients of manure, provided sufficient rain fell to enable the ground to do so. With regard to the effects of certain manures upon plants, he found that these affected not only plants, but also particular parts of plants. No doubt the application of phosphate manures had done much to bring root crops to that perfection in which they were seen at shows. If the regular supply of phosphates were withheld, he believed root crops would return to their original fibrous condition. By the application of strong forcing manures, containing mineral matters as well as nitrogen, to which element their forcing action was mainly due, leaf-growth would be obtained at the expense of well-ripened wood and fruit. Other manures promoted early maturity, which was of especial importance to fruit-growers, and to this result a combination of phosphatic manures with potash contributed. Potash and phosphate of lime, as in mixtures of the latter and wood ashes, gave, perhaps, a better crop of fruit than any kind of manure. The best form in which phosphate of lime could be applied for the purpose of growing fruit was that of bones partially deprived of their nitrogenous matters, of which they contain too much to be useful for fruit-growing in great perfection, more especially Grapes. Better fruit was often produced by using only half the quantity of manure. An artificial manure containing a good proportion of potash was often of great use, provided the potash was not in too large quantity, when it retarded rather than forwarded the development of plants. If land were of a sandy nature a limited mixture of salts of ammonia would be found very useful.

In some experiments which he had recently tried, he had increased the produce of a crop of Potatoes by the following dressing—viz., 4 cwt. of superphosphate, 2 cwt. of potash, and 2 cwt. of ammonia, costing 33s. per acre. The produce amounted to between 12 and 13 tons, while an unmanured portion only produced 6 tons per acre. This showed what could be done by a proper selection of manure. He had also tried another experiment, using only superphosphate and potash, and omitted the ammonia, and the result was that the crop fell short by 3 or 4 tons, thus showing the great service rendered by the ammonia. He believed that there was a great field open for investigation with reference to the supply of manure to fruits. Within the last few years several fruit-growers had dressed their Gooseberry bushes with artificial manures, and with great success. In pot-culture they should not apply any strong quick-acting manures, but they should prepare a compost, and use it with discrimination.

The Chairman said he believed there were some gentlemen present who took rather a different view from that of Dr. Voelcker, especially upon the source of the supply of nitrogen to plants, and he would, therefore, invite discussion upon the subject.

The Rev. C. P. Peach remarked, that of the various constituents contained in plants, nitrogen rarely existed to the extent of more than 2½ per cent. In grain, analysis gave us 2½ per cent., and in the case of Potatoes about 0.7 per cent., and this after the materials had been partly deprived of their hydrogen and oxygen. He thought it was going too far to say that nitrogen was of more value in a plant than any other substance; the carbon, for instance, amounted to 50 per cent. of the whole. Nitrate of soda and ammonia formed the only two useful ingredients of the chemicals sold for manuring purposes. Ammonia had very great power in dissolving carbonaceous matters and rendering them available for the food of the plants, which, when growing, took their carbon principally from the soil, and he was inclined to think that in this lay the great value of ammoniacal substances. It was commonly stated that a plant could obtain the hydrogen which it required from water, but his opinion was, that it was obtained more easily from ammonia. Silica was one of the most insoluble substances, but plants took it up by the roots, its solution being facilitated by alkaline salts, and hence the value of nitrate of soda. He thought silica was more valuable than nitrogen to the plant. He considered that, though temporarily guano might be of great service, its effects were not permanent. Nitrogenous matters were important as facilitating the formation of diastase, which as a solvent of starch was of the highest importance in plant nutrition, and on this account, rather than for any direct value, nitrogen was important.

Dr. Gilbert remarked that Mr. Peach's statements concerning the percentage of nitrogen in various crops was irrelevant. It was a question which had been under discussion for the last thirty years, and most elaborate experiments had been made. Boussingault and Ville had come to the conclusion that free nitrogen is not absorbed by plants, and the latter was at the present time making quite a sensation in France by his advocacy of nitrogenous manures. Mr. Lawes and himself had worked for several years to determine this question, and their conclusions were, that if nitrogenous substances were withheld, and only free nitrogen had access to the plant, no increase in the quantity of nitrogen in the plant took place; but when a small quantity of ammonia was given, it showed its effects in less than twenty-four hours. Mr. Peach had stated that the small quantity of carbonic acid contained in the atmosphere was insufficient for the proper development of plants, but he considered there was an ample supply in water and the air. The presence of an increased percentage of silica did not strengthen straw, as he had found that in almost all cases the best standing crop was that in which the lowest proportion of silica was found. In approving of the manner in which Dr. Voelcker had brought the subject forward, Dr. Gilbert stated that horticulturists would have to carry out many experiments before they would be able to get at the principles which had been so long arrived at in agriculture. The horticulturist had a far larger field for experiment than the agriculturist, in the vast number of his products and the wonderful control he had to exercise over the growth of plants. At present they had arrived at some useful results—results, perhaps, not quite conclusive, for they must not look to obtain from a few years' experiments the conclusions which they would eventually succeed in arriving at.

Major R. Trevor Clarke fully concurred in Dr. Voelcker's views with regard to manures applied in a solid form being more beneficial than those in a liquid state. One of their most clever Rose-growers, who was present (the Rev. Reynolds Hole), was well aware of their superiority. Great development in root crops and fruit was mainly due to the use of manures rich in phosphates, and he thought there was a very good field open for physiologists to experiment in; for instance, in causing plants to revert to their original state, or to develop into new races.

Mr. D. T. Fish said that if the gardener desired a good crop of Roses he must have rich manure. The farmer was content with one crop where the gardener required three, and therefore it was necessary that the gardener should use a much greater quantity of stable manure. The time of applying it had also a very great effect upon the crop, and he had found that those farmers who left the manure upon the top of the ground in winter had the best crops. Soluble manures were certainly those which accomplished the greatest good. He believed that the atmosphere contained sufficient material for the food of plants without much aid from the soil, and he should account for

the presence of silica in Orchids and other tree plants by the presence of it in the atmosphere, as the roots of these plants never touched the soil. This, he thought, was borne out by Professor Tyndall's recent experiments. This was a very interesting question, and he hoped some of their scientific men would be able to throw some light upon it.

The Chairman then proposed a vote of thanks to Dr. Voelcker, which was unanimously agreed to.

Dr. Voelcker, in returning thanks, remarked that there is always an abundance of silica both in soils and water, and that silica applied in the form of dust would certainly do no good to the plants.

Mr. Ingram's paper on "The Distribution of Soils, and their Influence on Vegetation," was then read, but elicited no discussion.

The Congress again met on the 21st inst., Major R. Trevor Clarke occupying the chair. The first paper read was by Professor Lawson, and entitled "A Short Account of some of the more Eminent Oxfordshire Botanists and Gardeners."

The Rev. S. Reynolds Hole then made the following remarks on Roses.

Mr. Hole commenced by mentioning that ten minutes being the time allowed to each speaker, he would have to compress twenty-five years' study of the Rose into that time, much in the same way as they compressed several ounces of meat into small lozenges, a box of which would last a man for a week's travelling. There were three main elements required to grow good Roses—site, soil, and sustenance. As to site, the Rose should be protected from boisterous winds, and at the same time have plenty of fresh, pure air. It did not much matter whether the site was a hill or table-land, provided there was plenty of timber to make natural screens, so that the wind came in as through a respirator. They must not come to him and say there was not sufficient space for this; it must be found where there is shelter and not shade, as overhanging boughs were fatal, as also were the main roots of trees. There was a Rose called the Royal Horticultural Society, which had been attempting to bloom for the last three or four years under the shade of a large tree, called the Agricultural Society, and although it had had the most consummate skill and the best attention paid it, still its efflorescence was not satisfactory. "Let it come away from the large timber," said Mr. Hole, "and then gather ye your golden Roses." Where Potatoes would grow well there was the Rose to be found in its glory. Then as to soil, plenty of lime in Rose soil added additional brightness to the glowing colours. With regard to sustenance, he would recommend good farmyard manure as the best food for Roses. Much good had been done by the use of artificial manures, but they would always remain second and supplemental to farmyard manure. Manure should be laid on liberally in November, and dug-in in March, and then one more dressing should be given when the buds began to swell, and the colour to show. Pruning should be done in October, and the weak wood cut out in March. The great enemies of the Rose were aphid and mildew, but if it had proper soil and sustenance these would never appear unless caused by spring frosts. For the caterpillars there was no remedy but to employ children, and have them picked off by the hand. The best stocks from which to select Roses were those which most frequently took the great prizes at our exhibitions, but if they only wanted a Rose garden and did not care about exhibiting, let them buy in a large proportion of Roses upon their own roots, because they were prettier, more abundant in flowers, and more enduring, and, therefore, more economical. The best stock for the Rose was the Manetti.

We understand that the total number of the visitors at the Show amounted to about 12,000.

SEA-SIDE PLANTING.

From the remarks which have appeared in your columns from time to time on this subject, it would seem that additional particulars would be acceptable.

One of the principal points to be considered is, as Mr. Robson and Mr. Owen have remarked, that of soil, which differs so considerably along the coast-line of England. Confining ourselves to the southern portion of the kingdom, it is obvious that the same standard could not apply alike to the district of the Dover cliffs, of the Cornish downs, and the slopes of Torbay. To treat them alike because they agree in the bare fact of being lines of sea-coast would be to fail. Take, again, the important differences of climate; these are illustrated by the state of growth to be seen in the narrow district of the western half of the county of Cornwall. There passes down through this section a backbone of granite hills, which in a rough way equally divides its width. From the base of this range northward to the sea, for instance, the Larch and Spruce Firs succeed hardly in a single case, and for a full length of fifty miles it would scarcely be too much to say that no one tree of either of these kinds is worthy to be called a specimen of ordinary symmetry; but immediately you leave the grim granite, southward they grow successfully, and within ten miles of where the failure of these and many other desirable trees is apparent, choice and beautiful arboreta are to be seen.

In confirmation of this, if any of your readers find themselves in the neighbourhood of Falmouth, for instance, and will visit, say, the grounds of B. W. Fox, Esq., Pen-jerriehe, they will be satisfied that almost abutting on the sea it is possible to rear one of the finest collections of Conifera and other choice growths probably to be found in England. Then let them steer due north until they find themselves equally near the sea of the north channel, and the contrast will be complete. This difference in so small an area of country is due not so much to difference of soil as of climate, for if the soils of the northern and southern sections were exchanged the difference would probably continue. The main reason of this variance is, of course, that the storms which so keep down the foliage come principally from the north and west, and whilst the northern is mercilessly beaten by these, aggravated by saline particles, the southern portion enjoys comparative immunity owing to the shelter of the range of hills.

Along the north coast nothing is found so successful for an outsider as the Black Italian Poplar stuck in almost as thickly as bean-stalks, and cuttings answer nearly as well as rooted trees. No ill-usage of the weather or neglect of the planter seems able to prevent its rapid growth.

The next line of planting should be an evergreen shelter; invaluable for this will be found a mixture of the *Pinus austriaca*, Evergreen Oaks, and many species of the large-leaved Hollies, particularly *Ilex nobilis*, which enjoys the southerly of Dreadnought in this neighbourhood. This class of Holly is not cultivated so much as it deserves. The common one is no great acquisition, but the larger-growing kinds grow faster, stand unblemished in the severest frosts, rarely suffer from storm, and, moreover, are beautiful in their foliage and outline.

Amongst the Conifera that may safely be planted within the lines named, I should class as being at the same time most ornamental and hardy, *Picea Nordmanniana* and *Abies Menziesii*. *Wellingtonias* are useless, *Cedrus Deodara* is a failure, and the *Arbor-Vita*, Cypress, and Juniper tribes scarcely ever succeed, but almost always suffer more in the winter (rather, I think, from the action of the salt than from the force of the wind), than they recover in the summer, and so gradually deteriorate. The *Pinus insignis* is, I suppose, tried oftener than any other tree of its class, and with various results. It is to be observed that a great difference exists in the appearance of different specimens, and in the seedlings of the same bed; whilst some have a texture approaching in course hardihood to the *austriaca*, others are obviously of more delicate constitutions, the leaves being finer and more numerous, the colour more delicate, and this variation is all the difference between its being a most handsome and valuable tree, which cannot be too often planted, and its being an eyesore. The Stone Pine is found valuable also. The Scotch and Pinaster Firs should be excluded as much as possible, as their shattered remains, scattered on the barren downs, or near the ruins of a defunct mine, remind one of nothing so much as rare old Bewick's woodcut of "Desolation"—a half-starved donkey, by a ruin on a barren waste, in a pelting storm, chewing the remains of a broom. The English Yew will succeed if somewhat sheltered, but if prominently exposed will fail miserably.

Of deciduous trees the Cornish Elm, Alder, and Sycamore do best; the Poplar should not only form the windward wing, but should also be sprinkled over the whole wherever there is standing room, to be, of course, cut out as the permanent growth fills up. The Sycamore certainly acquires a battered appearance by the autumn; but, nevertheless, does not so shrink from the wind as the Elm, which, although indigenous, never holds its head erect where there is any wind-drift, but looks like a weathercock permanently indicating a north-west gale.

As to flowering trees, if "WILTSHIRE BECTON'S" floral experience were confined to this district, "by the Cornish sea," where the Lilac and Laburnum dare not droop their lovely pendants, instead of giving us his charming little Lilac-tide article, he would have been compelled to write a pastoral on the Tamavisk, which holds the field in their stead; and besides its usefulness, who has not felt its beauty, and lingered by it after a gentle summer's rain or heavy dew—

"When the great sun begins his state,
Robed in flame and amber light?"

As to shrubs, in the first rank must stand *Escallonia macrantha*, *Euonymus*, and *Berberis Darwinii*; next in value come *Phillyreas*, *Garrya elliptica*, *Daphne Fionians*, Hollies, plain and variegated; *Elmagnus*, and *Spiræas*. The Laurel and *Laurustinus* are not equal to the foregoing, as the wind easily strips them; the *Arbutus* and Bay will be found to be more

successful. For covering walls *Cotoneaster microphylla* and *Simmonsii* may be used, and in many instances *Ceanothus azureus* and *Veitchii* do very well. Worth noticing also is the success of the Elder as a screen in kitchen gardens, fruit quarters, &c. Around the Mount's Bay in particular, the seat of the earliest vegetable and fruit produce of the country, these may be seen more frequently than elsewhere. The cuttings strike easily, and planted in single rows in a few years run up, and when kept close-cut the little ground they occupy, the rapidity and close inwoven-form of growth, would make this

screen, but for its drawback of being deciduous, and, I suppose I must add, want of beauty, the consummation of shelter. Privet, Hornbeam, Thorn, and other fences are tried frequently, but never with the success of an Elder hedge. In ground, however, where appearance is more important, the *Escallonia* makes the best evergreen hedge; in Scilly it is the favourite, and does most of the hard work there. In fact, this is among shrubs what the Poplar is amongst trees, indispensable to success in seaside planting.—CORNUBIA.

GLASS WALLS.

THE accompanying engraving is a representation of a structure I have recently erected. It differs somewhat from those I have called double walls of glass; it being the intention to force the fruit in this structure, it was necessary to add a roof, in all other respects, with this exception of its being wider at the top, it is similar to the glass walls which I first introduced.

In this structure the ventilation is not only in the roof, but on each side under the gutter which carries off the water from the glass, the earth being removed to the depth of 4 or 5 inches, thus enabling the air to pass up between the trellis and the glass, birds being excluded by galvanised wire netting.

In a former article I have described the mode in which the glass is fixed in grooves, in which are inserted triangular pieces of copper to clasp the glass, keep it tight in the grooves, and prevent one sheet of glass slipping down over the other. I have also described the mode of preparing the timber, so as to render unnecessary any painting afterwards, which, with puttying, are very important items of expense in horticulture. My present experience leads me to hope that insects will not harbour in timber that has been boiled in creosote. Some persons object to the colour of the wood thus prepared, which in the course of a few months becomes of a rich brown; if thought proper the fronts of the

rafters might be painted stone colour in the course of a year, which would give the whole a lighter appearance.

As I have before alluded to the advantages to be derived by this mode of growing fruit, I will merely mention a few of its most important features—viz., thorough control over autumnal rains; perfect ventilation by the passage of the air between

the trellis and the glass, both surfaces of the leaf being thus exposed to light, for without quality in foliage we must not expect quality in fruit; thorough ripening of the wood; command over the red spider; and, to crown all, we have every part of the fruit thoroughly ripened. I may also add that early fruit is ripened a fortnight earlier, and that late fruit becomes thoroughly ripe.

The fruit trees in the structure here engraved consist of various kinds of Peaches, Nectarines, Apricots, Plums, Cherries, Figs, Strawberries in the border, and Grapes, the last being trained along a wire under the ventilator, which ventilator is opened or shut

simultaneously throughout the whole length of the structure by the usual mode of a winch. I was induced to try various experiments to insure a crop of fruit independent of the weather, a very large supply being here required for consumption. I have now had sufficient time to test this last experiment, and I can recommend its adoption with the greatest confidence.—OBSERVER.

THE WORK DONE BY A LEAF.

Now, what does it do? It pumps water from the ground, through the thousands of tubes in the stem of the tree (the tubes which itself has made), and sends it into the atmosphere in the form of unseen mist, to be condensed and fall in showers—the very water, that, were it not for the leaf, would sink in the earth, and find its way perchance through subterranean channels to the sea. And thus it is that we see it works to give us the “early

and the latter rain.” It works to send the rills and streams, like lines of silver, down the mountain and across the plain. It works to pour down the larger brooks which turn the wheel that energises machinery, which gives employment to millions. And thus a thousand wants are supplied, commerce stimulated, wealth accumulated, and intelligence disseminated through the agency of this wealth. The leaf does it all.

It has been demonstrated that every square inch of leaf lifts 3-500ths of an ounce every twenty-four hours. Now, a large forest tree has about five acres of foliage, or 6,272,640 square inches. This being multiplied by 3-500ths (the amount pumped by every inch) gives us the result—2352 ozs., or 1176 quarts, or 294 gallons, or 8 barrels; a medium-sized forest tree, about 5 barrels. The trees on an acre give 800 barrels in twenty-four hours. An acre of Grass, or Clover, or grain, would yield about the same result.

The leaf is a worker, too, in another field of labour, where we seldom look, where it exhibits its unselfishness—where it works for the good of man in a most wonderful manner. It carries immense quantities of electricity from the earth to the clouds, and from the clouds to the earth. Rather dangerous business, transporting lightning. I think it would be considered contraband by the "U.S.," or "Merchant's Union," or any common carriers: but it is particularly fitted for this work. Did you ever see a leaf entire as to its edges? It is always pointed, and these points, whether they be large or small, are just fitted to handle this dangerous agent. These tiny fingers seize upon and carry it away with ease and wonderful dispatch. There must be no delay; it is "time freight." True, sometimes it gathers up more than the trunk can carry, and in the attempt to crowd and pack the baggage the trunk gets terribly shattered, and we say that lightning struck the tree. But it had been struck a thousand times before. This time it was overworked.

As we rub a stick of sealingwax or a glass tube with a warm silk handkerchief, so the air is always rubbing over the face of the earth with more or less rapidity. And what a huge electrical machine! But be not afraid, the leaf will see that it is taken care of. As we guard our roofs from the destructive action of lightning—dashing to the earth—crashing, rending, burning on its way—by erecting the lightning rod, whose bristling points quietly drain the clouds, or failing to do this, receive the charge and bear it harmless to the earth—so God has made a living conductor in every pointed leaf, in every blade of grass. It is said that a common blade of grass, pointed by nature's exquisite workmanship, is three times as effectual as the finest cambric needle; and a single twig of leaves is far more efficient than the metallic points of the best constructed rod. What, then, must be the agency of a single forest in disarming the forces of the storm of their terror?

Nature furnishes the lightning, and it furnishes the lightning rods. Take a hint, then, and plant trees.—(*The American Entomologist and Ecologist*)

EXTRACTS FROM THE REPORT ON THE BRISBANE BOTANIC GARDENS.

Among the plants used for tanning purposes are mentioned the Sumach (*Rhus Cotinus*), &c., all of which are flourishing, and eventually will, doubtless, become here of great practical utility and value. The Croton Oil (*Croton Tiglium*), the Candle Nut Oil (*Aleuritis triloba*), two species of Castor Oil plants (*Ricinus communis*, and *R. spectabilis*), have been properly tested, and will, beyond doubt, yield most remunerative profits to both the cultivator and the manufacturer.

Of the Tea (*Thea Bohema*) and the famous Paraguay Tea (*Ilex paraguensis*), the Coffee (*Coffea arabica*) most excellent samples have been made, and it can hardly be doubted that before many years Queensland will be independent of the world for a supply of these luxuries. The Allspice (*Pimenta vulgaris*), the Ginger (*Zingiber officinalis*), the Turmeric (*Curcuma longa*), the Cardamon (*Elettaria Cardamomum*), the Grain of Paradise (*Amomum Melegueta*), the Tapioca (*Manihot utilisima*), the Cassava (*Manihot Jatropha*), &c., are growing luxuriantly, and samples of all, and of superior quality, have been manufactured.

Among the tropical fruits may be enumerated the Mango, the Cherimoyer, the Soursoop, the Sweetop, the Jack Fruit, China Date Plum, the Avocado Pear, Bananas, &c. Pears were publicly expressed in Brisbane a short time since that the Banana was deteriorating, but under careful cultivation it is satisfactory to know that there is no reason for apprehension on that score.

The silkworm trees, *Morus cedrona*, *alba*, and *multicaulis*, the *Ailanthus glandulosa*, &c., remain in excellent condition, and are frequently inquired after by those who are interested in sericulture. I would respectfully propose that cuttings or plants of these trees be planted on the grounds of the Orphanage, they would answer the purpose of shade trees, and would

serve to amuse the children by furnishing food for their silkworms. Frequently applications are made by them at the gardens for leaves of the Mulberry for this purpose.

SELSEY ISLAND.—Your correspondent "G." is wrong in speaking of a living Lord Selsey, for the title became extinct in 1838, owing to the absence of male issue. There is no doubt that the last baron who bore the title fostered the culture of the soil, and may have inherited the taste, for he was descended from one of the most celebrated gardeners of a previous generation. His ancestor, Sir John Peachey, married a daughter of George London, Esq., of Long Ditton, who was Superintendent of the Royal Gardens in Ordinary to Queens Mary and Anne.—J.

WORK FOR THE WEEK.

KITCHEN GARDEN.

Use all diligence in filling up vacant pieces of ground with *Broccoli*, *Borecole*, *Brussels Sprouts*, *Colworts*, &c.; and where ground is scarce, crops likely to come off soon should be interlined, for the purpose of establishing as large a breadth of the above useful vegetables as can be done. Hoe frequently between young crops, and plant out a good supply of *Endive*, *Cauliflowers*, *Walcuren Broccoli*, and *Cabbage* for the autumn. Sow *Lettuce* and *Onions* to stand over, and *Radi-shes*. Liberal waterings twice or thrice a-week in dry weather will be required by *Peas*, *Cauliflowers*, *Spinach*, *Artichokes*, *Lettuces*, &c., rendering them not only better in quality, but making them last longer in perfection. Sow immediately Wheeler's Imperial and other approved kinds of *Cabbage* for the principal spring crop. Sow thuly on good, but not rich land, and in an open situation, which are points to be kept in view in sowing all seeds of this class. The earliest *Celery* may be forwarded by small additions of earth. Sow small quantities of *Basil*, *Chervil*, and *Marjoram* required for use in a green state. Let a good sowing of *Bath Cos Lettuce* be made directly. This will stand all the autumn, and on well-prepared ground will produce fine Lettuces. Some of the later plantings from this sowing may be covered with inverted pots after tying up. Fine large Lettuces can be preserved by this means up to the early part of the winter.

FRUIT GARDEN.

At this period a very general stopping of late growths and laterals should take place, both in wall trees and espaliers; it may, in the main, be accomplished by pinching off the extreme points. This is particularly necessary where it is desirable to carry out the dwarfing system. With regard to other fruits, however, there can exist no reason for suffering over-excited trees to continue producing wood, which can never be perfectly ripened, and which must be pruned away in the ensuing winter. The necessary consequences of this process are—first, a greater concentration of sap in the neighbourhood of the fruit; second, an inducement to the axillary buds to prepare for development; and third, the equalisation of the sap, thereby encouraging a greater uniformity of growth. In performing the operation with reference to the latter principle, the grossest of the shoots only should be stopped, leaving all the lower parts of the tree growing until the end of the season. Attend well to fruit trees of all kinds. Little superfluous wood should, if possible, be formed on tender fruit trees after the middle of August. Not only the fruit, but the wood, for the ensuing year, must be ripened. Even Apples, Pears, Plums, and Cherries are amenable to this law in some degree.

FLOWER GARDEN.

Let nothing be allowed to grow out of place, but attend to the wants of growing plants by giving them their proper supports and training at this season; the next matter requiring consideration will be the propagation of stock for another year. In commencing with *Pelargoniums* employed for bedding purposes, beds of sandy soil in the open ground will serve the *Scarlets* of all sorts and their allies, while the *Fancies* and other kinds with a delicate habit will be better in pots, or, where large quantities are required, in a frame under glass. Under any circumstances they will require protection from heavy rains. There is a class, of which *Sidonia* is one, which strike with difficulty by cuttings of the shoots, and are best propagated by root cuttings; prepare cuttings of the thickest roots about 1½ inch in length, which should be inserted in shallow pans and plunged in a frame; the old plants should be selected for the purpose. Herbaceous plants and hardy

bulbs now in full beauty should be kept in order by tying up loose growths and keeping the ground free from weeds. Novelties should have their colour, habit, and time of flowering marked down as a guide for future arrangements. Follow up Rose budding; those planted last winter, if they have not started well, must have a little more time. Care must be taken that all the decayed and withered petals of Carnations and Picotees are removed from those calices where the seedpod is formed. This may be ascertained by subjecting each to a gentle pressure of the thumb and finger. It will also be advisable to carefully split the calyx in order to prevent the lodgement of water, which is apt to take place when this is neglected. Proceed with all possible dispatch in layering, and prepare some good loam and leaf mould, well mixed, for potting-off the early-rooted layers, for, when sufficiently rooted, they are better away from the parent root; it gives them a check and prevents spindling. The old stools of Pinks will have now made considerable growth, and thrown up much grass; this will afford a second crop of pipings, and a large stock if required. If the plants have been grown in pots they may be turned out in the open border the first showery or suitable weather. It is advisable to preserve some old stools of few or scarce sorts, for, if well grown, they are often more steady in the production of well-laced flowers than younger ones, and they are also useful for producing seed. The beds of Ranunculuses, from which the roots have been taken up, should now be dug over and ridged up in order to sweeten the soil by exposure to sun and air. The soil, also, for planting Tulips should be carefully turned over, and all grubs and wireworms destroyed. Entrap by all possible means earwigs on Dahlias, and remove all misshapen buds as they appear.

GREENHOUSE AND CONSERVATORY.

Although flowers of all kind are at this period most abundant out of doors, yet some large and well-grown specimens of choice kinds will always furnish interest in the conservatory. To accomplish this, large shifts must be had recourse to, accompanied by improved modes of potting—viz., extra drainage, together with a greater reliance on turfy soils in a lumpy state, than upon complex composts. The climbers must at all times receive much attention in this house. Stopping gross wood is too much neglected. Above all secure a thorough freedom from insects, together with a most cleanly system. All this presupposes plenty of labour directed with judgment. Cut down Pelargoniums, pot off cuttings directly the roots are formed, and repot plants previously headed down as soon as they begin to break. Shift and sow Cinerarias and Calceolarias. Sow Mignonette for winter use. The stock of pot Roses should be looked over, useless wood and decayed blossoms removed, and the plants shifted; fibrous loam, night soil, and burnt earth may be used effectually. Camellias which have matured their flower buds may receive additional assistance either by soil or manure water, as circumstances allow. The common Anemone, potted three or four in a pot, and placed in a comfortable frame with the Neapolitan or Russian Violet in September, may be introduced to blossom on the shelves of the greenhouse during November and December. The common single Blood Wallflower, also, if sown in March, the leading shoots pinched out in June, and potted three in a moderate-sized pot, generally produces a good bloom through the dead of winter. Many more plants of this kind might be enumerated.

STOVE.

Those Orchids suspended in baskets or on blocks should have frequent handling as to their state of moisture. They will require a liberal supply at this period. All blocks will need frequent though light syringings. The business here is mere routine at this period; propagation matters having been attended to, together with high cultivation, little remains but to endeavour to perfect the wood already made. This must be accomplished by a freer circulation of air, and a somewhat less amount of atmospheric moisture.—W. KEANE.

DOINGS OF THE LAST WEEK.

WITH next to no water, for years we have never seen plants suffer more in a garden than they did on the 21st and 22nd inst., and even the 23rd was trying, though the air was cooler; and some slight signs were given, if not of a change, at least of a more vapour-laden atmosphere, as on the morning of Saturday we had a better deposition of dew than we have seen for two months. Many plants whose leaves were prostrate and

seemingly half dried up, revived and stood erect for a time on Saturday morning.

It is rather tantalising to read how some of our coadjutors and friends speak of what may now be done after "rain has come at last." From the beginning of the year we have scarcely had more than skiffs of rain—nothing to sink into the soil, nothing to replenish our exhausted reservoirs. Most of the rains have been very partial. During a day from home, in a space of some twenty miles, in three small places far apart, we found the roads in a puddle from next to a deluge, whilst immediately beyond this little spot we might as well have driven through the desert of Sahara. The absence of anything like a hay crop in this neighbourhood, though very trying to the holders of the land, will be lessened in its evils by the reported heavy crops in the northern counties. On our journey the other day from Luton to Oxford, with the exception of a few green meadows, we found the whole of that district had suffered from drought as much as our own neighbourhood. Even the princely Blenheim with its wondrous lake was no exception. The park grass crackled beneath our feet; the extensive lawns, except in shaded places, had scarcely a tinge of green. Even in such circumstances, though in many places the cereal crops were thin, in others, Barley and Wheat especially, seemed rather to be above the average—a pleasant thought for us bread-eaters, though liable to be greatly counteracted by this unlooked-for, hideous, and more than culpable war.

From all we could learn at Oxford we came to the conclusion that as respects the fall of rain, this has been an exceptional year. We recollect many years ago, in an early article in this Journal, alluding to the proverb, "Cart corn to the west, drive cattle to the east," based on the fact that the dripping weather of the western counties was so conducive to rich meadows, whilst the drier and sunnier atmosphere of the eastern counties was more favourable to cereals. This season, on the evidence of such men as Mr. Garaway, of Bristol, the drought has been felt severely in the west; whilst Mr. Carnichael, of Sandringham, spoke of the splendid crops in that naturally rather hungry district, owing to the frequent and abundant rains. Our recollections of Oxford and its gathering will be delightful, only possible to be enhanced if the visitors to the horticultural department had been three times the number they were on the first two days. Something in this respect may be owing to the neighbourhood, to the extreme heat and fierceness of the sun, to having the horticultural and the agricultural shows so far apart, and, perhaps, to having them at the same time at all. Many seemed to complain of the toil in going over, so as to "do" one of the exhibitions thoroughly.

Those who are interested in the watering question, will do well to correct for themselves an extract, as given about the middle of page 49, first column. It should have been, "Between March and May, we have much cold wet weather." As printed, the word "wet" is left out, to the derangement of the sense and argument. Great as was the outcry about general dryness, we found no case where there were less means of artificial watering than our own. Our small sources were very nearly exhausted on the two dread days above referred to. We knew if we could tide over until the 25th, we should have the chance of getting some, even if dirty, water, though other things were not neglected.

The chief work of the end of the week, was *mulching and shading*, the latter in the case of small plants coming in along with the first. For instance, we put rather short litter round Lettuces, young Cabbages, Cauliflowers, and Broccoli, not so protected before, fresh planted Strawberries, &c., and on many of these we sprinkled longer cleaner litter over the tops. Calceolarias showing signs of suffering, and which we would be sorry to lose for three months, and which in addition to mulching we could not litter without destroying their beauty, we shaded rather thickly with laurel boughs, firmly inserted and secured, so that even in wind they might not chafe against the flowers. The young growths of the laurels came in well for this purpose. A little water was given to individual plants suffering most. Everything under glass was given less air, and the glass more or less shaded, to keep out the drying heat, either with moveable coverings or a fair coating of whitened water. With everything looking well it seemed a pity that so many plants should be burned up, which they would have been, with our inability to water, and two or three days of burning, cloudless sun, such as we had on the 22nd. We hope to tide over until the 25th or 26th, when we may expect either more means or a change of weather. The gardener with a plentiful supply of water, knows nothing of the anxiety of him who has

a large establishment to serve, and every store of clean water exhausted. Some would say, Let the plants die and be done with, but that is poor policy, until every remedial measure is exhausted.—R. F.

TO CORRESPONDENTS.

•• We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

BLUE PIMPERNEL (Wild Flower).—This variety of the Shepherd's Weather Glass, or, as you call it, "Shepherd's Darling," is not uncommon. The following is an extract from our "British Wild Flowers":—"There is a variety with blue flowers, which has been regarded by some as a species under the name of *Anagallis carulea*; and there is another very pretty variety discovered by J. Dillwyn Llewellyn, Esq., of Penllergare, South Wales, which is pure white, with a purplish-pink eye in the centre of each corolla."

COCOA-NUT FIBRE REFUSE (E. M. P.).—You can obtain it from Messrs. Barsham & Co, Kingston-on-Thames. It is very cheap.

PHALIS EDULIS (W. Dickson).—This, commonly called the Cape Gooseberry, has been known for nearly a hundred years. You will find it figured and described in the "Botanical Magazine," vol. xii, t. 1068. It has been frequently noticed in our back volumes, particularly in vol. vii, old series, page 187, and there is a very full account of its culture by Mr. Beaton in vol. xv, page 250. As a material for cordage and paper, the plant, it is obvious, could not be grown in sufficient quantity in this country to pay. We shall be glad to learn your mode of culture, if different from that described by Mr. Beaton.

ADIANTUM (D. M.).—The date of Mr. Williams's book on Ferns and Lycopods is 1838. It would not pay to issue a new edition every year. Consult the "Gardener's Year-Book" for the most recent introductions. The part front of *Adiantum* enclosed belongs to *A. formosum*. We do not know *A. recurvum*. There is one named *A. curvatum*. The flowers of the Solanum Capsicastrum probably turn yellow and fall from want of water, a deficiency of air, too much heat, or imperfect root-action. We have ours a mass of berries in an airy greenhouse.

ADIANTUM PEDATUM (A Yorkshire Amateur).—It is a hardy Fern, and as such may justly be exhibited in a collection of hardy Ferns, though it would, of course, be disqualified if exhibited as a British Fern, it being an exotic. We cannot be positive without a specimen.

CUCUMBER LEAVES SCORCHED (T. Stenden, Southwark).—The leaf presents every appearance of red spider, but we cannot discover it. We think, however, it is the cause of the brownness of the leaves. We advise you to pick or cut off all the leaves like those sent us, and then syringe the plants with a solution of soft soap and sulphur, 3 ozs of the former and 1 lb. of the latter in three gallons of water, boiled for a quarter of an hour. Syringe with the clear liquid, and paint the sides of the frame, pit, or house with the sediment. Keep rather close, moist, and shaded from bright sun, and stir the surface soil, removing it if at all sodden, and replacing it with fresh. A sprinkling of water every afternoon at closing will be very beneficial, thoroughly wetting the leaves, but not very forcibly directing the water against them, otherwise they may be injured.

PRUNING HOLLIES (Norwood).—Having now made their growth it would be injudicious to prune the Hollies at this season. It would be best done in the spring of next year, when they are beginning to grow.

PEACH HOUSE PLANTING (H. D.).—In a house so narrow as 7 feet wide we fear you will not have space for a row of pyramids in front and trees on the back wall. For the front, if you have any trees, we should prefer espaliers or cordons, but not training them so high as to shade the trees on the back wall. If you have height in front, then by all means have pyramids. For pyramids or cordons, we should select Rivers's Early Beatrice, Early Louise, Early Rivers, Acton Scot, and Early York; and for the wall, Early York, Royal George, Noblesse, Grosse Mignonne, Bellegarde, Violette Hative, Barrington, and Late Admirable.

AZALEA LEAVES BROWNED (Julia).—The leaves sent us have no signs of having been attacked by insects, and we think they are scorched in consequence of the sun shining powerfully on them whilst wet. Admit air earlier in the day, so as to have the leaves dry before the sun strikes on the plants. A slight shade from bright sun whilst the plants are making new growth is necessary.

OAK FERN NOT THRIVING (Idem).—We think your Fern would do better if you were to cover it with a glass shade, unless it be in a cool, shady, moist part of a greenhouse, or in a fernery, where the glass is not needed. It requires a compost of two parts sandy peat, and one part limestone broken up rather small, and intermixed, with a free admixture of silver sand. Good drainage is necessary. It is essential that the plant should have a good supply of water when growing, and at no time should the soil be dry, but it is not good to sour it by too frequent and heavy waterings. A gentle sprinkling overhead during dry, hot weather, is very beneficial. It succeeds out of doors in a slightly shaded situation, and in a calcareous soil; the plant should be well drained, and be well supplied with water when growing. The cause of the fronds drooping and shrivelling is probably a too dry and draughty atmosphere.

STRAWBERRIES FOR A SANDY SOIL (Reader).—We have on a sandy soil Sir Joseph Paxton, Keens' Seedling, Rivers's Eliza, Dr. Hogg, Bicton Pine, and Frogmore Late Pine, with Cockscorb, all good. You may obtain them of any respectable nurseryman, but we must decline recommending dealers. Consult our advertising columns.

CUCUMBERS DAMPING-OFF (A New Subscriber).—The cause of the fruit damping is, no doubt, a deficiency of bottom heat, accompanied with too much moisture. We advise you to thin out the shoots, shortening those retained, which should be the most healthy, and those promising fruit. Those with or showing fruit should be shortened one joint beyond it, and we would cut off all the leaves which are at all yellow and browned. This will admit more air and light. Water so as to keep the soil moist—two or three times a week will be sufficient—and admit air early in the day, closing early in the afternoon. If you could give the bed a lining of hot dung, but not rank or fresh, it would assist the swelling of the fruit.

MANURING GROUND FOR ONIONS (Idem).—The seed bed for Tripoli Onions need not be manured, but the ground must be in good heart. When the ground is manured the plants are liable to grow too strong and do not stand the winter well; besides, they become thick-necked, and do not plant out well in spring and form good bulbs. The ground, however, in which you intend to plant them out in spring should be well manured in November, and then well dug or trenched, throwing the soil in ridges if at all heavy. In February or March, throw down the ridges in dry frosty weather, making the soil do, and you may before planting give a good dressing of powdered charcoal and point it in with a fork. Well-decayed stable or farmyard manure is most suitable.

HEATING A SMALL GREENHOUSE (C. A.).—We think that your slow-combustion Musgrave stove, ought to keep out frost from your span-roofed greenhouse of 18 feet by 10 feet, but in cold nights you should, before you go to bed, turn your slow combustion into a more active combustion, by admitting more air to the fuel. We do not know the size of your stove, but we have kept frost out of a house double the size of yours with a moderate-sized iron stove, but then we made its combustion of fuel subservient to our pleasure, making the combustion slow when we wanted little heat, and more active when more was demanded. A principle is good to act on, but we should not let it regulate every circumstance. If you cannot thus manage, then in your circumstances you had better have a small stove at each end of the house. We think one, however, if well managed, would be ample.

PEAR AND PLUM TREES SPURLESS (M. G.).—As the spurs of both Pears and Plums have so dried up and died on your old trees, but are still fruitful on the top branches, and the breastwood is, nevertheless, strong, we would cut out the strongest shoots, and lay in those of moderate size between the old branches. If these are stopped at from 18 to 24 inches, you may expect a few fruit buds the first season, and more the next.

MUSHROOM CULTURE IN A VINERY PIT (Cliftonensis).—You could have first-rate Mushrooms in the pit in the vinery whilst your Vines were at rest, and after being started until the temperature reached 60°. After that the Mushrooms would not do so well, unless you could keep from them the higher temperature of the house. The pipes below the bed for bottom heat, though not so bad in winter, would be rather unfavourable to them when you had a brisk temperature for Muscats.

EXHIBITING FINE-FOLIAGED PLANTS (E. P.).—We should prefer the *Cissus*, unless the *Alocasia* is a fine plant; if the latter is so, and the variegation well marked, it would have the preference. It is impossible to decide which you should show without seeing the plants.

DICKSONIA ANTARCTICA AND PTERIS ARGYREA (W. H.).—Both are exotic Ferns; the former a tree Fern from Tasmania, and the other from the East Indies. The latter requires the temperature of a cool stove or warm greenhouse. The *Dicksonia* thrives well in a similar temperature, and will succeed in a cool greenhouse fernery. The fragment of Fern from we think is *Dicksonia davallioides*, but we are not sure, as it is so small, and not in fruit. If it is that species it requires a greenhouse temperature, being from Australia.

LUCULIA PROPAGATION (A. B., Guildford).—Take cuttings of the young shoots when they are becoming a little firm, as they will be from mid-summer to the end of July, and insert them in sand over sandy peat well drained. It is desirable to place the cutting-pot in one of larger size, bringing the rims of both level, and then fill the space between with crocks to within an inch of the top, then with fibrous peat, surfaced with silver sand, and on this should rest a bell-glass covering the cuttings. Stand in a close pit or frame, and in a fortnight afford a bottom heat of 75°, and in six weeks they will have callused, but it will be the following spring before the plants can be said to be established in small pots, though when they are rooted they should be potted off. It is a plant that strikes root slowly, and makes but little progress in a young state.

MYRTLES NOT FLOWERING (An Inquirer).—As your plants grow freely, we conclude they have a too shady position; if so, all that is required to flower them is to place them in a light, airy position in the full sun, keeping them moderately dry, and we have no doubt they will flower next year. In the shade Myrtles grow well, but seldom flower.

IMPROVING LIGHT SANDY GARDEN SOIL (T. H. S.).—The blue marl which easily falls with the frost would vastly improve your garden. A good dressing of it spread on the surface after the crops are off, allowed to be acted on by frost, and then dug in, would be of more value than manure, though on sandy soils there must not be any stint of manure, that of a cool nature, as cow dung, being the most serviceable. As regards the Vine borders, we think the dressing with marl will also be advantageous, especially as the soil is very poor and light. Though light open soil is generally advised for Vines, yet there is danger in extreme openness and dryness of soil, as well as in adhesiveness and wetness of soil. It is well to have a dry in preference to a heavy border, as we can by top-dressings with bones, &c., vastly improve the soil's fertility. In addition to the dressing with marl, we would give a good top-dressing of equal parts of turfy loam, fresh horse droppings, a fourth of half-inch bones, and the like proportion of charcoal, all well mixed, and put on the border when the Vines are pruned.

ASTERS (P. E. J.).—It is no doubt green fly which troubles you in the cultivation of your Asters. It would have been easier to have prevented its appearance than it will now be to remedy it. Syringe them with a decoction of soft soap and tobacco, and keep them always well watered and growing freely; that is the great secret. It is in this that the

Parisian gardeners bent you—viz., the proper use of the watering-pot. Good, rather light, but rich soil, with an almost unlimited supply of water, is what Asters like. If they have this there will seldom be any green fly or curled leaves.

INSECTS ON VINE LEAVES (*J. Easton*).—We do not know how you packed your Vine leaf, but on the closest examination we could discover neither caterpillar nor red spider, and only found some little bits of red wax. Such a leaf should have been securely enclosed in oiled paper. We can hardly understand your allusions to red spider, in connection with caterpillars. This is just a season for red spider, where plenty of water could not be used.

INSECTS ATTACKING CONIFERS (*L. H.*).—The resinous swellings at the bases of the young shoots of your *Pinus insignis* are caused by the exodation of the sap, resulting from the attacks of the caterpillars of a small handsome moth (*Tortrix Buoliana*), which is now being produced in the perfect state, and which ought to be carefully sought for on the trunks of the trees and killed. Later in the season smaller swellings (caused by the caterpillars hatched from eggs deposited by the present brood of moths) should be looked for and destroyed. We found no insect on the small single shoot of *Picea Nordmanniana*. The shoots of the *Abies orientalis* and the *Spruce Fir* exhibit curious swellings like miniature Pine Apples, caused by the minute *Chermes Laricis*, a fly allied to the aphides, which is reared within the swellings. If they are so numerous as to become injurious to the trees, the swellings should be cut out, especially before the insects are developed, at which time the small scales which surround the swellings burst open to allow of the escape of the flies.—I. O. W.

NAME OF INSECT (*Chesham*).—The caterpillar sent by you is the remarkable one known under the name of the Lobster caterpillar. The moth is named *Stenoprota Fagi*.—I. O. W.

NAMES OF PLANTS (*Marten Cat*).—No. 1, of which we had preserved your flowering specimen, we now recognise as *Corous mascula*, popularly known as the Cornelian Cherry. No. 2, is the *Calycaanthus floridus*, or *Carolina Allspice*. (*Constant Reader*).—1, *Centraothus ruber*; 2, *Spiraea salicifolia*; 3, *Bryonia alba*, a poisonous plant. (*G. A. N.*).—1, *Escallonia rubra*; 2, *Jasminum odoratissimum*. (*E. H. D.*).—*Pelargonium alchemilloides*; *Escallonia rubra*. Your *Tropaeolum* has no merit to recommend it. (*A. W.*).—*Ocimum sphegiferum*. (*Flora, Guernsey*).—*Fatsia japonica*, more commonly known as *Aralia Sieboldi*. (*P. J. Newton*).—*Viola cornuta*; *Campanula crepitosa* of Scopoli, generally known as *C. pusilla*. (*W. H., Belbroughton*).—Your shrub is *Rhus Cotinus*, sometimes known as the "Burning Bush." (*An Old Subscriber*).—*Linaria Eliatine*. (*Thos. Pearson*).—1, *Goniolobium appendiculatum*; 2, *Pteris tremula*; 3, *Adiantum cuneatum*; 4, *Pteris cretica albo-lineata*; 5, *Pteris serrulata*; 6, *Asplenium bulbiferum*; 7, *Adiantum assimile*. (*A Young Gardener*).—*Gaultheria bracteata*. H. Jeffrey's "Rudiments of Botany," is the work we should recommend to you; its price will, we believe, be not more than 8s. 6d. Oliver's "Elementary Botany," published by Macmillan, is also first rate, and will cost about 8s. 6d.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE MANAGEMENT OF POULTRY.

RECENTLY at a meeting of the Whitby Chamber of Agriculture, William Stonehouse, Esq., of Darnholme, himself a noted poultry-keeper and prize-winner, read the following instructive and amusing paper on the management of poultry:—

It was not without some misgivings that I needed to the request of Mr. Wilkinson to read, to the members of the Whitby Chamber of Agriculture, a paper on poultry. Knowing that, with farmers, and indeed with many others, poultry is not a popular theme; knowing also that Chambers of Agriculture usually apply themselves to the discussion of questions of greater importance, such as "The consideration of legislative enactments affecting land," "Leases," "Tenant Rights," "Rotation of Crops," "Deep versus Shallow Draining," "The effects of various manures upon different soils," and so forth; and knowing, moreover, that in this society, small though it may be in point of numbers, you have had able, and I might say exhaustive, papers read to you on local taxation, the adulteration of seeds and cakes, dairy farming, &c., I felt that you could scarcely be expected to descend so far as to listen to a paper upon poultry; for, somehow, poultry-keeping has come to be regarded as a somewhat ignoble pursuit, and a fit occupation only for women and children. If a man of mature age busies himself about, or takes any interest in poultry, he is looked upon as a sort of "harmless lunatic;" and anyone who, in later life, indulges in this hobby, must be prepared to endure a large amount of good humoured "chaffing" from his friends, who will crack stale jokes over him, and after inspecting his stock, will perhaps inquire if he does not keep any white mice, or monkeys, or racoons. At an agricultural show, your wives and daughters, your sons too, if they are not more than ten or twelve years of age, may visit and scrutinise the show pens in the poultry department, but you, yourselves, would almost blush to be seen there. Even the judges of horses, cattle, and pigs, at these shows, give the cold shoulder to the judges of poultry, and look down upon them as persons occupying an inferior social status. At one of the Whitby shows, some three or four years ago, sitting in the tent during the brief interval which is devoted to luncheon, the judge of horses was interrogated by the judge of sheep or pigs, or something else:—"I say, who is your chap, and what is he judging?" "Which chap?" inquired the judge of horses. "You chap with the white waistcoat," pointing out a gentleman who was, on that occasion, one of the judges of poultry, and who was of course conspicuously adorned with the proper badge of office. The judge of horses rested his eyes

for a moment or two upon the judge of poultry, a curious expression settled upon his features—an expression eloquent of contempt, and he delivered himself in this wise—"Him a judge—his's nea judge. He's nobbut a *chuckie greaper*."

Well, with a knowledge of this—may I say?—prejudice which exists against my feathered friends, there was an instinctive presentiment in my mind that this paper would have to be read to a "beggarly account of empty benches." At the outset, let me say that the paper possesses one quality—that of brevity—which, if it does not commend it to your favour, will, I hope, bespeak your indulgence and soften your criticisms. The supply of food for an ever-increasing population is a question fraught with deep importance, not only to the statesman and political economist, but to all who feel an interest in the future well-being of their country; and if it be true that he is to be regarded as a benefactor of his species who makes two blades of grass grow where one only had previously grown, then also, in like manner, must he be regarded who troubles and quadruples the produce of eggs and fowls, especially when, in these islands, our present supply of those articles is so inadequate to the demand that we have to import annually about five hundred million eggs, besides an enormous number of fowls, amounting altogether in money value to between three and four millions of pounds sterling; and is it not wise to inquire whether the productiveness of our poultry could not be developed and increased, so that these three or four millions of pounds sterling annually, instead of going into the coffers of our continental neighbours, might flow into the pockets of the English farmer? Does France possess any peculiar facilities for breeding and rearing poultry? for it is from France that much of our poultry produce is imported. I know of no advantage over England save that of climate, and that is not so great as it might, at first sight, seem to be, because it is not in the south, but in the north of France chiefly, that eggs and fowls for the English market are produced.

The secret of the success of poultry-breeding in France lies not so much in any superiority of the climate as in superior management. "They manage these things better in France" is a saying which is literally true with respect to poultry. There are in the northern parts of France large numbers of small holdings of land, and on those small holdings poultry-keeping is not infrequently the leading object of husbandry. The small farmer in France has found out that by the application of care and skill poultry-keeping pays well; and if the small farmer in England would devote the same time and attention to the pursuit, there seems to be no reason why it should not be equally remunerative to him. When we hear persons complaining that poultry-keeping does not pay, we should inquire whether any pains have been taken to make it pay; for when we know the way in which poultry is treated, or rather maltreated, in too many instances around us, we cease to wonder at these complaints. Any sort of a cockloft, without light and without ventilation, is considered good enough for a "hen house." The excrement from the birds is allowed to accumulate for twelve months, or sometimes longer; the walls are never whitewashed or cleaned. If you were just to put your nose into a house of this description some night when the birds had been roosting for a few hours, you would at once admit that it is impossible for poultry, under such circumstances, to do well. Then it is by no means an uncommon practice for poultry-keepers to send the chickens of each year to the market, and to keep the old hens for stock, instead of keeping the pullets for stock birds and killing off the old hens. Again, it is very seldom that any skill or judgment is exercised in the selection of stock; the birds are allowed to breed in-and-in, with little or no admixture of fresh blood, and as a necessary consequence the progeny become feeble and unproductive. In the pages of the *Field* and the *Journal of Horticulture*, two publications which contain much poultry intelligence, the question is often put—Does poultry-keeping pay? and if you read the letters which appear in answer to the inquiry, you will be amused and bewildered, some writers asserting that their fowls almost lay the fabled golden eggs, and that the shortest way to wealth is to take a large farm and stock it entirely with poultry. Others declare their fowls eat their heads off two or three times in the course of the year; that eggs cost them, at least, 1s. each; that such of their chickens as do reach maturity are the scraggiest of the scraggy; and that, in short, if you want to make ducks and drakes of your money, go in for poultry-keeping.

Desiring to eschew the exaggerated statements of these writers, and anxiously to guard myself against conveying the notion that I regard the poultry yard as a veritable "Tom Tiddler's ground," I do not hesitate to affirm that a limited number of poultry, if properly managed, will be as remunerative to the farmer as any other stock will be—that is, in proportion to the amount of capital employed. This is the testimony, after long experience, of many practical farmers, notably of Mr. Mechi, who maintains that his poultry are more profitable to him than his sheep. But perhaps you do not consider Mr. Mechi an infallible authority. At any rate Mr. Mechi's works prove the sincerity of his faith and words, and that is saying something, for he keeps upwards of three hundred fowls upon his Triptree Hall Farm, which are allowed, and indeed encouraged, to roam over the corn fields up to the time of harvesting, and in a letter to *The Times* newspaper he tells us that a field of wheat immediately adjoining the poultry yard, and which had been during the year the favourite resort of the fowls, yielded a larger amount of grain per acre than any other field on the farm. Mr. Mechi does not deny that the fowls eat some of the corn, but the loss

enstained in this way, he contends, is far more than over-balanced by the good which they do in destroying grubs and insects.

Well, then, we say, for poultry to be remunerative, there must be good management. And what constitutes good management? In the first place the poultry house must be properly constructed, sufficiently large for the birds contained within it, dry and warm in winter, and well ventilated in summer; it must be kept scrupulously clean, the walls whitewashed with lime two or three times during the summer; then there must be a bath-room, simply a dust heap, protected from the rain by a shed or covering, and open in front to the sun's rays. This dust heap should be composed of finely-sifted ashes, sand, or soil, and kept perfectly dry. Here the birds will constantly repair to luxuriate in their bath, and rid themselves of the numerous parasites to which they are much subjected. Of course, the birds must be fed, and fed at fixed times. If their meals are scanty, let them be regular. They must have a grass run, and a constant supply of pure water. When these few essentials are provided, poultry will thrive and do well; and surely when we reflect how useful these domesticated animals are to us, we must acknowledge that it is an imperative duty on those who keep poultry to supply them with whatever may be necessary to their health and comfort. In that admirable paper, read by Mr. Kerr a month since, admirable for the useful hints which it conveyed, there was much most of you could grasp and appreciate better than I could; but there was one portion which delighted me on account of the humane sentiments which pervaded it. Mr. Kerr deprecated all rough usage of cows, and pleaded for kind and gentle treatment. Let me put in a like plea for fowls. Certainly it is one of the most pleasing signs of the times in which we live, that kindly treatment of the so-called animal world is, among educated persons at least, fully recognised and taught, and we may hope that anything like cruel or harsh treatment of domesticated animals will soon be blotted from the things that be.

Then as to the particular breed of fowls which it is the most profitable to keep. If eggs are wanted, Hamburgs, or everlasting layers as some term them, are unquestionably the best; for young birds of this breed will lay, on the average, more than two hundred eggs each in the year; they are never broody, their eggs are small, but so long as the stupid custom obtains of selling eggs by number, instead of by weight, this circumstance inflicts no loss upon the seller, whatever it may do on the buyer. There are five varieties of Hamburgs—the Gold and Silver-spangled, the Gold and Silver-peucedil, and the Black. Mongrel varieties are to be found in almost every farmyard in the neighbourhood. They have an abundance of names, as Pheasants, Moonies, Dutch Chittrepts, Bolton Greys, and several others. When pure, with their markings perfect and regular, Hamburgs are very beautiful birds, but they are small, and not of much value as birds for the table.

If chickens are required, some other breed must be kept; and as to the best bird for this purpose, I suppose a jury of matrons would pronounce in favour of the Grey Dorking. Dorkings are large and heavy birds; their flesh is white and firm, abounding particularly on those parts which are most esteemed—viz., the breast, wings, and merry-thoughts. As chickens, they grow rapidly, and come to maturity early. These are qualities which commend them to all good housewives, and fully account for the character which for generations the Dorking has had as the table fowl, *par excellence*. Some writers claim for this bird a very ancient lineage, averring that the Dorking cock strutted on the British daggill when the Romans occupied this country. Dorkings are not prolific in the production of eggs, and they are unfortunately of a tender constitution, and will never succeed on wet or cold soils. If a fit of cold or wet weather assails their chickenhood, they droop and die with fearful rapidity. This is a serious drawback upon their merits, and poultry-breeders have long been seeking to find a table fowl which will combine the good qualities of the Dorking with a greater degree of hardiness. Game fowls are hardy and handsome; they are great favourites with many as table fowls, but they are small, and have, generally, a tendency to yellowness in the skin. Epicurians, however, assert that the flavour of a Game fowl is superior to that of any other breed; but, then, tastes are fanciful and capricious. A gentleman, well known to you all, keeps a breed of Game fowls upon his farm. His wife favours Dorkings, and, consequently, Dorkings are kept at the hall where these worthy folks reside. One day last autumn the lady and gentleman in question sat down to dinner, the bill of fare including a roast fowl, which was in due time carved and discussed. "Did this fowl come from the farm?" inquired the gentleman; the lady answered "Yes." "Ah! I thought so; I never tasted anything like it, the flavour is delicious. You may say what you like, but there's no kind of fowl equal to that of Game for flavour." "Except Dorkings," mildly suggested the lady. "Dorkings! pooh, pooh," says he, "they have no flavour at all." And then the lady laughed loud at her lord—"Why, my dear, this deliciously-flavoured fowl, which charms your palate so much, is a Dorking hatched at the farm from eggs which I sent from here." So you see how a person may be beguiled by his fancy.

A few years ago there was quite a mania for Cochins, which mania afforded the artists of Mr. Punch materials for a number of humorous illustrations; and Mr. Roelback, I remember, when he returned from France, on that memorable occasion when the Queen, accompanied by so many members of Parliament, paid a visit to the Emperor of the French, said "the 'Moscos,' in their peg-top trousers,

reminded him of nothing so much as a lot of Cochin-China fowls." Cochins possess many good qualities; they are hardy, are easily kept in confinement, and they are good winter layers; but as fowls for the table they do not hold a good position, the yellowness of their skin and fat is not prepossessing, and the flesh is coarse. The Hon. Mrs. Arbutnot some years ago—then Mrs. Ferguson Blair—published a little book, entitled "The Hen Wife," in which she strongly recommends, as decidedly the most profitable fowl for farmers, a cross between Grey Dorkings and Black Brahmans. Brahmans are large birds, very hardy; the flesh, if not so white as that of the Dorking, is said by connoisseurs to possess a peculiar juiciness, which is highly prized. They are quiet and docile; have no propensity to fly; they live contentedly and healthy in a confined space, and are never troublesome in getting into gardens or fields. As egg-producers they are commendable; not so prolific as Hamburgs, but then their eggs are much larger, and, like Cochins, they lay freely in winter. Their chickens are particularly hardy, and easily reared; the pullets commence laying early; they are capital mothers, and after hatching a brood of chickens will resume their laying within a month, and they are by no means such heavy feeders as Cochins. Mrs. Arbutnot recommends Brahma hens to be mated with a Dorking cock; from this cross table fowls may be obtained which, as she says, "look like young Tarkeys."

There is a very wide diversity of opinion among poultry-keepers as to what is the best food for poultry. In the winter season there is, perhaps, nothing better than barley, but in summer, and more particularly in hot weather, barley is too heating, and wheat, what is termed "tail wheat," is then much better. But whatever may be the main article of food, there should be a frequent change of diet. Indian corn, barley-meal and potatoes, turnips, and beetroot boiled, are all good for this purpose. In France buckwheat is almost exclusively used. It is cheap, and is considered by some authorities to be the very best poultry food. Lime in some shape must be provided, to furnish material for the construction of the shell of the egg.

The proper management of sitting hens is so well known, that it is unnecessary to say much on that head. Nature is the best and surest guide in such matters, and it is always the best to allow the hens to follow the direction of their own instincts as much as possible. Too much interference irritates the birds, and it often frustrates our success. To give an illustration. In February or March last year two or three of us—birds of a feather—met on the platform of the Whitley Railway Station, and straightway began to compare notes as to our poultry. Each, in turn, gave a recital of his ill-luck in hatching, and in summing-up and taking the average the result showed that we had got about one bird out of every ten eggs. Mr. Cooper, the station-master, hearing or surmising the subject of our discourse, accosted us—"You are talking about chickens, just come with me." We walked on to the goods station. "There," says Mr. Cooper, pointing with pardonable pride to a hen and seventeen chickens, "what do you think of that?" "Aye, what indeed! We had been reading and cramming ourselves with poultry lore, had been nursing our much-prized sitting hens with every imaginable care, administering their diet on the most scientific principles, lifting them off their nests daily, and sprinkling their eggs with tepid water, and, in short, using "all appliances and means to boot," only to reap the disappointment and mortification which I have mentioned; and here was a mongrel thing of a hen, which had "stolen her nest," as the phrase goes; secreting in some snug corner, she had deposited and hatched her eggs. She had been missed from her accustomed place, was supposed to have been stolen, when one morning she came back clucking with seventeen fine chickens at her heels.

You will meet with persons who tell you they can correctly predict the sex of the future chickens from the peculiar shape of the egg. Some eggs, as you know, are more elongated, and some more round than others, and the long and the round forms have been held to be each indicative of a certain sex. Others again, have pretended to discover the sex from the position of the air bubble at the larger end of the egg. These are all fallacies which have existed hundreds of years, and although proved to be fallacies hundreds of times, they still exist. Not only is it impossible to predict the sex, but it is impossible even to tell, before the egg has been set upon for a short time, whether it has been fecundated. A friend told me that the subject of determining the sex of the chicken beforehand was discussed at great length at an anniversary meeting of one of the Shipping Insurance Clubs in our town last winter—an odd subject certainly for a maritime party, reminding me by its very incongruity of an incident which occurred some time ago. A gentleman on going into the smoke-room of the Angel Hotel found two master-mariners in their shirt sleeves, engaged in fisticuffs. The combatants were parted, and, on investigation, it turned that their fight had originated in a difference of opinion as to "whether the Wesleyans or the Congregationalists had the better collection of hymns." But speaking of eggs, it may surprise some to be told that the strongest man in this room is not strong enough to crush an egg when it is placed endways between the palms of his hands. The shell of an egg is composed of small particles of carbonate of lime, arranged somewhat in the same manner as bricks, and placed in an arch, and have an enormous strength, but during the incubation the particles of lime lose that regularity of arrangement, and become confused, and the same egg, which before resisted your utmost strength, is now easily crushed by a child.

A great quantity of poultry is kept almost entirely for exhibition. Points of excellence in the various birds have been argued upon and laid down, by which they are judged. But, as perfection is rare, even in our species, so also it is rare in that of the gallinaceous, and many are the tricks and frands practised to remove blemishes, and to impose upon unsuspecting judges. The face of a Black Spanish fowl, for instance, must be of a pure white. If a faint blush of pink obtrude, or if a few straggling hair-like feathers show their unwelcome presence, farewell to all hope of a prize at a good show, so the owner of this bird paints the stains with some white substance, shaves off the obnoxious feathers, and probably carries off a silver cup, which, had the bird been exhibited in its natural and untrimmed condition, he would not have had the remotest chance of doing. In Brahmas and in Cochins one great object is to get birds with heavily feathered legs. Now this peculiarity is mostly, and as it would seem naturally, accompanied by a projection of feathers from the leg-joint, which is known as the "vulture hock," but the arbitrary taste of judges has decreed that this vulture hock shall be deemed a defect. The consequence is, that in scores of instances these hock feathers are skilfully pulled out, and the judges are imposed upon. Then there are smaller sins in the way of trimming. A Silver-Grey Dorking cock must have a breast of spotless black, but a few white feathers will come. Well, these are dexterously extracted, and then the bird is pronounced perfect. A Dorking cock's comb must be rigidly upright; a Dorking hen's comb must lop over; and all sorts of schemes are adopted to coax these combs into the required condition. I heard the other day of a gentleman who had two Dorking cocks—one a splendid bird except his comb, which would lop in spite of all that could be done to it; the other bird had nothing much to boast of except his comb, which was magnificent. Well, the two birds were brought together, an expert surgeon was summoned, who whipped off the combs, popped the perfect one on the otherwise perfect bird, and secured it in its new position by a few stitches. It struck, and grew, and flourished, and the bird subsequently achieved distinction as a great prizewinner. A clever case of trimming was exposed at a poultry show last winter. In the West Riding of this county there are two great rival poultry-keepers, more particularly rivals in Hamburgh breeding—Mr. Beldon and Mr. Pickles. Beldon generally takes the first rank, but last year Pickles almost invariably distanced his rival in Silver-pencilled Hamburghs. According to the standard of excellence the sickle feathers of the cock's tail in this breed must be black, or very dark, with a fine edging of white, and in this particular the superiority of Pickles's birds was conspicuous; and at the show in question they were awarded the first prize. Beldon has a poultryman named Job, and Job was of course put out at his ill luck, and stood ruminating before Pickles's prize pen. "His birds are not so good as ours if it wasn't for their sickles, but they're stunning sickles, certainly. I can't make it out how he manages to get them." Gaining the consent of the attendant, Job contrived to get hold of the bird with the wonderful sickles, and blowing into the roots of the tail feathers, when lo! the murder was out. "Well I'm blow'd," said Job, "fetch Mr. Hewitt." Mr. Hewitt, who was the judge of the poultry at the show, was soon on the spot, when Job pointed out to him how the natural sickle feathers of the bird had been cut down to the quill, and the beautiful artificial sickles neatly fitted into their place. Mr. Hewitt immediately cut off the borrowed plumes, and gibbeted Mr. Pickles, by affixing a notice to the front of the pen, fully describing the fraudulent transaction.

To prize-poultry breeders the annual show at Birmingham is the great event of the year, where some five thousand of the best fowls in the three kingdoms are exhibited. Among the exhibitors you have the royalty, nobility, and clergymen in great numbers, for your clergymen are generally good livers, and can appreciate fresh eggs and well-fed chickens; notwithstanding Sidney Smith, who says "Barndoor fowls for dissenters, but for the thirty-nine-times-articled clerk of the Church of England—the Pheasant—the Pheasant, and nothing but the Pheasant." I summed up the amount at which the birds were priced in the catalogue of the show of last year, and found it to be £40,000. In many instances no doubt these prices were intended to be prohibitory, but a single bird at the Birmingham Show will sometimes sell for a sum of money which would buy the best cow in this district. I saw a bird, it might be called a chicken, only nine months old, sold by auction for sixteen guineas, and with in the last eighteen months two birds have been sold from Whithy for ten guineas each.

Having kept poultry for about five years, and having kept also during that time a careful debtor and creditor account of my poultry doings, I can speak with the certainty acquired by experience as to the cost of keeping fowls. Even under the unfavourable position of having all the food to buy, and at retail prices, I have had the pleasure to find at the end of each year a small balance on the right side. The cost of the food does not exceed 1½d. per head per week. Then if you kill off the hens, say at the expiration of the second laying season—that is, when they are a little more than two years of age—the entire cost of keeping each bird up to that time will have been, in round numbers, about 15s. Now take the *per contra* side—each hen in those two years and odd will lay 250 eggs. I am speaking from my experience of Brahmas; Hamburghs will lay more than 400, besides hatching two or three broods of chickens, if you obtain a fair proportion of eggs during the winter season, and you may do so by contriving to have your pullets hatched early in the year. It will be fair to put down the price of these eggs at 1d. each, making £1 0s. 10d., and the hen, if put up to

feed for ten days or so, will not be dear at 2s. 2d., making a total of 23s. of receipts upon each hen, as against 18s. of expenditure. Then there is the dung, and you do not need to be told that the dung of fowls, when mixed with dry earth and pounded, is in value not far short of the best Peruvian guano. In this calculation I have not taken into account any of the notoward contingencies to which all kinds of stock are liable. Accidents will happen in the best regulated poultry establishments, but with careful management these should be few and far between.

With respect to Ducks, Geese, and Turkeys, I have not had much experience. I believe, however, that they are fully as remunerative as fowls; and except when very young, do not require so much attention. Ducklings and Goslings for the first two or three weeks, and Turkeys for six or eight weeks, are tender, and require great care; but when these ages are attained they are all hardy, and require comparatively little care or attention.

To conclude this desultory paper, and to epitomise, very briefly, the few practical suggestions which it offers—let me say to those who keep poultry, Be very careful in the selection of your stock. If your object be to produce a large quantity of eggs, keep some of the varieties of Hamburghs. If you require chickens for the table, keep Brahmas and Grey Dorkings. Keep young birds only. Introduce fresh blood into your yards every year, or at any rate every second year. Pay strict attention to the sanitary condition of your fowls. Give them, in short, the same care and thought which you would give to other branches of husbandry, and you will not much longer entertain the opinion that poultry-keeping does not pay.

Mr. S. Burn said he entirely agreed with many portions of Mr. Stonehouse's able paper, and with some portions he disagreed. For a length of time he had been one of those maniacs alluded to by Mr. Stonehouse (laughter), and he had certainly derived both pleasure and profit from the pursuit (hear, hear). He had been the fortunate owner of a chicken that was sold by auction at Birmingham for ten guineas, a result which had not been attained without some little care and attention. As a farmer's bird, he recommended a cross between the Brahma and the Dorking. Most farmers looked upon poultry as a department belonging entirely to the mistress, forgetting that if she did not rear the poultry and the poultry lay the eggs, they would have to give the goodwives money to make the marketing with. Lately, he (Mr. Burn) had superintended the poultry department of a farmer who thought he was not receiving as much from his grocer as he was spending in corn, &c. He (Mr. Burn) found that this individual had on his farm many of the same fowls that were there when he entered, and some of them must have been part of the original birds introduced into this neighbourhood. They had a general slaughter amongst them, some fresh birds were introduced, and the effect was so beneficial that poultry-keeping became much more profitable. The owner was astonished to find that by going on this improved system, it made about £30 a year difference. He brought about three hundred eggs to market every week, and had a large fine stock of poultry. He (Mr. Burn) had put this theory to the proof, for he had one six-year-old hen which had laid very few eggs, and he had another, a young Golden-pencilled Hamburgh, which had laid 204 eggs since the 1st of January. As to food, he entirely agreed with Mr. Stonehouse. The scraps ought to suffice, and poultry should be made the cleaners-up of the farm, except in winter time when they required feeding well. If farmers would feed their poultry well, they would find the benefit of it when eggs were 1d. each, and generally poultry was not sufficiently well fed. In France they had a moveable poultry house, which went on wheels from field to field. He believed farmers would find all kinds of poultry profitable if they paid the same attention to it as they did to other stock.—(Whithy Times.)

THE CANADIAN "POULTRY CHRONICLE"— HATCHING EXPORTED EGGS.

I HAVE received the first number of this new journal by last mail. It contains sixteen octavo pages, but the editor seems to have found some difficulty in filling up his first number. It is not stated in the "Chronicle" itself, but I learn from other sources that it is edited by Mr. McLean, Secretary of the Canadian Poultry Society.

The most interesting paper in this number is one containing the results of eggs imported from England, the number being fifty dozen, all from one breeder. The eggs were badly packed, and many were broken or altogether missing; nevertheless, the results were better than could have been expected. From twelve Brahma eggs the result was four chicks; twelve Houdan eggs, eight chicks, four of which were Black Hamburghs! as is remarked with good-humoured irony by the writer; from ten Pencilled Hamburgh eggs four chicks, with two dead in the shells; from twelve more of the same breed, seven chicks and one dead. The remainder of the consignment were not hatched at the date of the report.

I suppress the name of the exporter for the purpose of remarking that the purchaser complains strongly of his conduct in sending varieties not ordered in place of some he was

unable to furnish. The complaint is just; and it cannot be too strongly urged upon all doing any business across the water, that anything but strictly honourable dealing will infallibly lead to dissatisfaction, not to say disgrace.

By the way, I hear that Col. Hassard, R. E., is under orders for England, and has sold off his Canadian stock. If so, Canada will lose, and we shall gain, a most enthusiastic fancier. —L. WRIGHT.

THE TROUBLES OF EGG-HATCHING.

"EVERY chicken," said Mrs. Thorp to her sister, as they passed through a large stack-yard in which scores of young chickens were playing among the dry straw and hay seeds, "should live and grow through May, if it is to cost little, and be of worth to its owner."

"Don't speak to me, Clara, of May chickens, or, indeed, chickens of any month," replied her sister, "I cannot bear it. We have striven and failed, failed so completely that the sight of a feathered thing is distasteful to me. Frank spent more money last year over rearing his chickens than would have taken his own chicks and their hen mother to the seaside for a month. To think of the bother and trouble, and loss and death we had. I would not for anything go through it again."

"You might have better luck another time; my chickens are no trouble."

"Ah! but then you have had a world of experience, and you have a lot of old fowls at the farm to choose from, when you want one to hatch your fancy eggs bought at a fancy price; we had nothing but the market to go to, and the oldest, ugliest hen we could purchase at a dear rate, under the name of a clucking hen, was sure to have clucked her last before she reached our home. We were once nearly desperate, for we had half a score of big idle hens neither hatching eggs nor laying eggs, but walking up and down scratching and eating. What barley they did consume, to be sure! our man seemed to be always on the way to the nearest retail shop with a little white bag on his arm, and I cannot tell you how many sittings of eggs we had in the study laid up in baskets, and wrapped in cotton wool to keep them warm, and all these eggs had to be turned over daily. I never could understand the necessity of doing so, but yet I did it lest Frank should break them."

"But what were you doing to have so many eggs, and never a hen to sit?"

"We did not know the hens would not sit when we bought them. We were assured they would, that nothing could prevent their doing so, and like you we were determined to have May chickens. It was not to be; all about us eggs were hatching, in the old stone walls, and among the ivy, and rocking in the high thick branches of the sycamores; but our nests were empty. We could not walk out but we everywhere met with white or blue or spotted castaway shells, tell-tales of the new birds that had come to enrich the world; but our bird life lay dormant in the dark shell. We tried all ways reasonable, and I sometimes think unreasonable, to bring about the fulfilment of our desires; we put them in new nests, on lots of common eggs, and closed them up safe and fast, but they screamed and stamped and broke the eggs, and finally escaped. They would neither be coaxed nor driven; if you went near them they flew about like wild birds."

"You must have been deceived in the hens you bought. I have had them from a long distance, and they have done well."

"Have you? You are a farmer's wife, and understand such things. If I were troubled with a lot of sitting hens—I never shall be, though, if I can have my will—I would take them out for a drive, or hire lodgings at a strange place, and bring them home after a time. I am sure it would cure the most stubborn Cochins that ever dared to sit at an unreasonable time."

"But the Cochins I sent you, did she not do well?"

"Yes, she did very well, but she had no chicks. We thought to be wise and just, that it was first come first served, so gave her the oldest eggs, some Black Spanish that had cost a great deal of money. I do not know how old they were, but I had turned and re-turned them over and over again for many weeks—I cannot tell you how many; but I remember when I first took upon myself the important work, the starlings were building in the barn roof, and when I turned them over for the last time, they were popping large worms down the wide throats of their noisy youngsters. No life would come out of the shells. Frank said they had been dipped in hot water, or pricked through with a pin, or some one had played Columbus with them to a purpose."

"Your wisdom was at fault, Emily, for once; a few fresh eggs from the nearest farm would have done better for you, better for my poor hen."

"But what a mongrel tribe they would have been—all colours and shapes. I do not like common barn-door fowls; they may be all very well about cottages, but in a poultry-yard devoted to their use, they should be all of a sort, and of one colour."

"They would have made a settlement for you, a nursery in which to rear delicate birds, all of one colour, and so nearly resembling each other that you could not distinguish one from the others, if that is your desire. I would rather have the beauty of strong young life, than that of plumage apart from strength. I am afraid that many would rather their white birds were delicate of constitution, than betray one coloured feather. And then, too, the blame of failure is often thrown upon the hen or the eggs, when in truth it rests with ourselves. We cannot let well alone, we go groping about the nest, it is never deep enough, or soft enough, and we irritate the poor bird, until in disgust at our proceedings she forsakes her eggs—perhaps if we are fortunate to hide away her nest, and bring home, to our delight, such a brood of chickens as could not have been if our curious eyes and busy fingers had intermeddled with her. Fowls of all kinds are very distrustful of human help; by long patience, gentle tones, and quiet movements, do we alone win their confidence, and even then they are apt to regard us as giant marauders, taking our spoils after a wholesale fashion, and no outrage which the strong ever perpetrate on the weak is equal to stealing away the eggs from a secret nest. My wonder never is, that there are so few chickens hatched, but that there are so many. We nurse and coddle, and shelter our sitting hens from a drop of rain, a breath of fresh air, or a glimpse of sunshine, as though these powers were set to fight against our success, and yet we know that the rain often drips through the blackbird's nest, and the long grass and dead fern fronds that hide the pheasants are wet with dew, and yet their little ones come and thrive. But many think that they can do better than work with Nature. I have seen poor hens shunt up in little dark places, deprived of their daily walk and bath, with food to eat and water to drink, but no space in which to use their limbs. A weary three weeks they must have, a sad negation though not of their own choosing, for they would make all the way of their life bright and glad. The healthy chick comes with gladness into the world, and of all sufferers they are the most patient."

"Really, Clara, I never thought there was any need to consult their feelings and inclinations. I used to think if a hen wanted chicks she would hatch them in any place, and under any circumstances. I know now to my cost she will not always do so."

"And suppose that she would, in what condition would she be when her three weeks' imprisonment was over? Would the dark airless nest have given, or kept, an appetite? And with its loss surely health and spirits, and warmth would have fled. Then wonder would be expressed that the poor bird grown tame and quiet, did not teach her chicks to play. How little do the wisest know of the ailments of birds, and yet we all know that a vigorous healthy growth can only be produced under the happiest circumstances; therefore, we are diverging in no wrong path when we surround our poultry with what is needful for pleasure and comfort."

"No wonder Frank and I failed. I must own we thought more of our new poultry-yard than our poultry, but we tried over and over again. We had a sitting of Dorkings, and were lucky enough to get a hen to sit them; she did well, and our expectations ran high; the proper time passed, the shells remained unsnipped, though we could feel the throbbing of life beating strong within the eggs when they were held in the palm of the hand. Some one told Frank they were too dry, and if left to their fate would all perish in the shell, so a gallon watering-can filled with tepid water was brought, and its contents poured over them; the water ran in little rivulets all among the white eggs, and settled in a pool in the hollow of the nest, and I thought surely they would be drowned. It did no good; when morning came they lay a cruel sight, all dead, some in the shell, some out. It was a great disappointment to be so near to success, and yet to fail. Frank declared that he would have the next batch brought in-doors, and sit up with them all night, but he would save them. Our next were Hamburgs, from the breezy Yorkshire moors. They promised well; night after night we held them before the lamp to make sure they were not deceiving us; all were dark, not one remaining clear; seventeen of them had the big Cochins, and we had left her in a

moveable nest of her own choosing out in the poultry-yard. A long dry season was broken up by a thunderstorm, which threatened to leave a rainy night; fearing for the safety of our coming chicks, we took nest and eggs and hen into the poultry house. I felt glad to think all night they were safe from harm. Next day the Cochin was found comfortably squatted on the very spot where her nest had stood before being moved, not in the least caring for the falling rain, and her eggs were forsaken, they had been cold for hours. She never took to them again. We had no need to sit up all night. A week after our dis-appointment reached its height, we had what was said to be a Brahma hen hatching eight Brahma eggs. Frank was in Ireland, and I was determined they should not be in any way played with; they should do as chickens did in the days of our grandmothers, find their way unaided into the world, the strong should live, and the weak die; better to do so at once than after eating eggs and bread for weeks. Ah, me! Your little four-year-old namesake, Clara, came to me one morning with her pinafore held tight, exclaiming, 'Oh! Aunt Emily, your great yellow hen has laid such a lot of soft yellow eggs, only see.' They were my long-expected chicks; her small fingers had stolen them from their sleepy mother, and grasped them much too tightly; five were dead, she had but six; the one remaining would not die, though I much wished it would, but for months trotted on the sheltered side of its mother like a March lamb. It was all over with bird hatching. I sent the unused eggs into the kitchen for the cook, but she looked at them, smelled at them, and was quite sure they would not do for cakes or puddings, they were not fresh enough. Frank says 'He will try again.' I hope not."—MAUD.

EXPORTING FOWLS.

DURING the past three months I have received many American orders for fowls, and though I shall be able to supply very few if any of them, I have had to make inquiries on the subject in consequence, the results of which may be useful, and save some time and trouble to other readers of "our Journal," who may be desirous of supplying the American market.

There is only one line of steamers I believe, the Guion, which takes live birds, and the vessels of which sail every Wednesday. As far as I can ascertain, the most convenient plan is to employ the American-European Express Agency, of Messrs. Staveley and Co., the Temple, Dale Street, Liverpool, who will make all arrangements for care and feeding, and, in fact, take the sole charge of the birds from Liverpool, if delivered to them carriage free, by Tuesday afternoon, with all advice and instructions a post before.

The freight and charges from Liverpool can, if desired, be carried forward to consignee, in which case a small per centage extra is charged on account of the risk. The mortality is, however, on the average very small. The freight and charges to New York will vary from about 35s. to £2 10s., for a pen of three fowls, according to their size.

The birds should be sent in strong wooden pens or coops of proper size, with the top of a good slope to throw off wet, and only open in front. There should be fastened at the top of the open side a strong piece of canvas, to draw down in bad weather. The floor ought to be a few inches above the ground, and slightly sloping, and handles for lifting must also be provided. The size for three birds may vary from 2 to 2½ feet square, according to the breed, and the front is, of course, to be so arranged that the floor can be scraped easily.

The food of sea-going birds I find is usually mixed with a portion of sand to assist digestion.

The customs duty levied at New York is 20 per cent, *ad valorem*, on the net price of the fowls, and a very stringent declaration of the real value is required if declared by the consignee; but if the purchaser resides near New York, it may be best to let him declare the value, which may be done. This heavy duty is most oppressive, and endeavours are being made now to reduce or remove it, as being a great hindrance to the improvement of poultry in the United States. I believe American fanciers are not without hope these efforts in favour of a free trade in fancy fowls may be successful.—L. WRIGHT.

CURE FOR ROUP.

THIS deadly disease is of such continual interest to all fanciers that I have thought it well to copy, for English readers, a new prescription from the New York *Poultry Bulletin*. Some may

think this hot weather (it is 92° in the shade with me), an odd time to mention roup, but I think differently; the first change of weather will be so sudden a transition that many severe cases may be expected.

The prescription consists of one ounce balsam of copaiba and one drachm piperine made into sixty pills. They should be enclosed in gelatine capsules, or the medicine will be very difficult to administer. Two or three capsules or pills are to be given daily, and the head and eyes washed with a solution of a teaspoonful of sugar of lead to a pint of water.

This remedy appears to me extremely likely to be effectual; and Mr. M. W. Lawrence, who gives it, states that he has used it in over a hundred cases with complete success.—L. WRIGHT.

WESTWARD HO! POULTRY SHOW.

ALTHOUGH under a disadvantage from being held so far from the majority of poultry-breeders, the Westward Ho Exhibition has gradually increased in importance, until the Show this year was a most creditable one. The increase in the number of visitors from year to year is really surprising—so much so, indeed, that it was calculated that from ten to twelve thousand persons were on the grounds at one time. The Show is held close to the beach, and the natural beauty of the coast, and the gaiety and fashion of those who attended, rendered it most attractive. The general arrangements were most creditable. Although a matter for which the committee could not be blamed, we think it well to call attention to a mistake in the arrangements of the railway companies that cannot be otherwise than most prejudicial to their own interests, and which may well exasperate the owners of valuable show birds. We allude to the folly we have so frequently exposed of placing show poultry and show dogs in the same van during transit. In the present case, a fox terrier, the breed of all others which is the most prone to commit mischief, tore to pieces her own basket, and then ate away the basket containing some valuable fancy Pigeons, killing two pairs of birds that it would have been difficult to replace on any terms. In the case at Bideford, luckily the journey was completed before all the mischief that might have been done was accomplished, for, as the party in charge of the dog stated, "If we'd had to go another mile or two farther, not one would have been left;" and for the information of our readers we may mention that the Pigeons' basket being once broken, it was most fortunate that out of twelve pairs only two pairs were sacrificed, for, but for this timely discovery, all would beyond question have been destroyed. The tents for both were very superior, and every attention was paid to the welfare of all the specimens exhibited. The repacking of the birds was also carried out with promptitude.

First-rate Grey *Dorkings* were shown, and among the White *Dorkings* were a few isolated specimens of extraordinary worth. *Brahmas* were poor, but *Cochins* and *Gamb* fowls were much better than had been previously exhibited in this district. *Hamburgs* did not reach our expectations, but some good *Polands* were to be met with. The class for the best Barn-door cock and hen brought together a most incongruous though large entry, and in this, as also in the "Any other Variety" class, some unusually good Malays were entered. There was a class for "chickens of any breed" of the current year, in which some of the most forward specimens we have seen this season were competing. The first prize in this class went to Duckwings, the second to a pen of good Partridge-feathered *Cochins*, and the third to Light *Brahmas*. It is evident that a great advantage arises from the mildness of the early months of the year in this neighbourhood, and the development that ensues is rapid, from the chickens not meeting those sudden checks from change of atmosphere, which, to the sorrow of too many breeders in the northern counties, cause malformations of the extremities.

DORKINGS.—*Colour* L.—1, Mrs. A. C. Thynne, Penstowe, Stratton. 2, Rev. G. F. Hodson, North P. therton. 3, Mrs. P. Coffin, Penpercombe. *hc*, Miss J. Milwood, Newton St. Lee, Bristol. *White*.—1 and 2, W. Pickard, Hartland. 3, —Hammett, Bideford. **SPANISH**.—1, S. R. Harris, Cuscaro, near St. Day. 2, G. Tonkin, Bristol. 3, J. JUDGES.—*Poultry*: Mr. R. Teebay and Mr. Hindsen. *Pigeons*: Mr. Charlton.

(From a Correspondent.)

RABBITS.—These, as a whole, were good, but I regret that not more than twenty-six were shown, and more ought to have been shown, seeing that four classes were given, and the prizes if not so valuable as at some shows, were sufficient to have attracted more entries. Few exhibitors are induced to enter their Rabbits solely because of the value of the prize, so long as it is adequate to pay all expenses if won. Honest judging, and great care taken of the specimens, are great inducements to exhibitors. The pens at this Show were large and well supplied with oats, straw, and hay, and I may add, as a hint to all committees, that the feeding is very important, considering the length of time some of the Rabbits are away from their hatches. In this instance some I know did not reach home until 6 p.m. on the day following the Show. Carrots and turnips are cheap enough, in the absence of oats, &c.

The first-prize pair of Yellow and White Lop-eared, belonging to Mr. C. Gravid, of Thorne, fully deserved the position they took, being a splendid pair. A little more and equal sprinkling of the white would, perhaps, have rendered them more perfect. Length of ears, doe 21½ inches by 5½ wide; buck, 21½ inches by 5½ wide. The second-prize pair from Mr. J. Boyle, jun., Blackbar, were Black and White; a pair of Grey and White, of Mr. Walter, Higham, Middleton, and a pair of clear Fawn, sent by Mr. Vaughan, Market Hall, Birmingham, were also highly commended. The first-prize Angoras of Mr. D. Kenyon, St. Leger Yard, Acerrington, were larger, perhaps, than the second-prize pair from Mr. J. Butterworth, Rockdale, but not so silky and long in the hair, and that is the important point with this variety. The first-prize pair of Himalayan from Mr. J. Butterworth were well marked, and as good in points as could be desired. The second-prize pair of Mr. Rawstron, Haslingden, were a nice pair, and the highly-commended pair of Mr. James Boyle, I think, must have given the Judge a little trouble before arriving at his decision. Of the Silver-Greys in the "Any other variety" class, the first-prize pair from Mr.

John Lunn, of Hull, were not so beautifully silvered as the second-prize pair from Mr. J. Butterworth, perhaps a little larger, and if only five months old, as stated, they were too young, perhaps, to be fully shaded or exhibited. The Judge, Mr. T. Charlton, 51, Trafalgar Street, Bradford, I think, may be commended for the justness of his awards, except where, I think, a little more careful handling of one or two of the specimens might have caused the prize cards to have been fixed upon other pens. The exhibiting of Rabbits in pairs tests a man's rabbitry, as single good ones can often be found, but to pair them with others equally good in all points is at times difficult. Again, all white Rabbits, as a rule, appear to disadvantage in pairs, especially the Angora, not looking so clean as when alone. I hope Haslingden will find next year, with the care bestowed, that the Rabbits will appear in great numbers, and I trust this improvement upon last year will induce owners to send their specimens.—C. R.

PONTEFRACT POULTRY SHOW.

The thirteenth annual show of poultry took place in the park on Thursday, July 21st, and the weather being all that could be desired, numbers came to witness the best show ever held in Pontefract.

The *Dorkings* were not numerous, but were in excellent condition for the time of year. The *Spanish* class was rather small, the first prize being taken by Mr. Newbitt, of Epworth, with a very good pen. The *Cochins* were an excellent lot, but greatly out of condition. The *Brahma Pouter* class was unusually large, and there was some difficulty in making the awards, owing to most of the birds being first-rate. The *Hamburgs* were not up to the mark. In the *Game* classes there was severe competition, a pen of Brown Reds from Mr. F. Sales, of Crowle, taking the first prize, as being the best pen in the show. The *Game Bantams* were rather large, but many of the best birds were not in condition. The chickens of 1870 were very numerous, the Society offering a much larger prize than for older birds. The first prize went to a pen of excellent Brown Reds. Below will be found a list of the successful competitors.

DORKINGS.—1, J. Barraclough, Ackworth, 2, W. B. Arundel, Transhell Lodge, SPANISH.—1, Messrs. Newbitt, Epworth, 2, Messrs. Pickard, Thorne, *hc*, W. B. Taiton, Ackworth, COCHINS.—CHINA.—1, Miss A. Moxon, Pontefract, 2, Messrs. Pickard, BRAHMA POUTER.—1, Lady Hawke, Womersley Park, 2, T. Addy, Asker, HAMBURGERS.—*Gold-spangled*.—1, J. Barraclough, 2, W. Jefferson, Pontefract, *Any other Variety*.—1, J. Wardell, Ackworth, 2, J. Barraclough, *Silver-spangled*.—1, J. Wardell, 2, J. Armer, Methley, GAME.—1, F. Sales, Crowle, 2, J. Greenwood, Featherstone, *hc*, H. Poskatt, Darrington, BANTAMS.—*Game*.—1, J. Warriner, Sandal-Magna, 2, H. Harrison, Pontefract, *hc*, Lady Hawke, *Any other Variety*.—1, Messrs. Newbitt, 2, A. E. Fox, Pontefract, *ANY OTHER VARIETY*.—1, W. Dooly, Ackworth, 2, F. B. Brank, Campsall Hall, *Chickens*.—1, F. Sales, 2, —, Pickard, *hc*, E. R. Frank (2), *Cock*.—1, W. B. Taunton, *Cochin China*, 2, F. Sales, *Black*, *Extra*, 2, Messrs. Newbitt, *Spanish*, DUCKS.—*White*.—1, Master W. Kenworthy, Ackworth, 2, D. Longstaff, Monkroyd House, *Brown*.—1 and 2, Dr. Horsfall, *Any other Variety*, 1, E. Lord, East Harwick, 2, G. Horsley, GESE.—1, E. Moore, Womersley, 2, J. Whittaker, Carlton, TURKEYS.—1, T. Plethorpe, Carlton, 2, Lady Hawke, GUINEA FOWLS.—1, D. Longstaff, 2, C. Marshall, Peckfield.

Judges.—Mr. S. Robson, Brotherton, and Mr. J. Wright, Snaith.

LIGURIANS IN JERSEY.

I SHOULD be glad to know if any of your readers have noticed two things in connection with their bees that I have observed—viz., the late appearance and scarcity of drones. In my stocks, four in number, no drones appeared till the middle of June, and then only very sparingly, and even at the present time they are not in great force. This time last year the massacre of drones was in progress; this year I see no signs of its commencement. A gentleman here who has a very fine strong stock of bees in a Woodbury hive, has seen no drones till within a day or two. The boney harvest has not been by any means good here up to the present time, as will be seen when I state what my colonies have done.

No. 1 is a pure Ligurian, with a queen at the head which I procured last autumn; it was then very strong and well provisioned. Though it had thrown off three swarms, it came through the winter well, which was a very destructive one to bees here; many lost nearly all their stocks. In the spring they gave signs of swarming, so the super was put on, but they have neither gone into it nor swarmed.

No. 2, hybridised Ligurians, located in a Neighbour's improved cottage hive. This contains a swarm of last year, which threw off a maiden swarm, was weak in the spring, but soon became very strong. The bells were put on, and the bees took possession, but did no work. Finding that the bells did not give them room enough, and that they were still likely to swarm, I put an adapting board on and a Woodbury super, taking care to wrap it up with non-conducting material; the bees began to work almost at once. They have constructed plenty of comb, but seem unable to find much honey, the long drought having had the effect of making the number of flowers less than usual. At one time honey-gathering went on very fast, but has almost stopped lately.

No. 3, a maiden swarm of last year, locted in a Woodbury, came through the winter well ; at the head of this is my original Italian queen. They went into the super June 16th, and for some time worked fast ; they have filled up the bars with comb, but now seem unable to get honey to finish filling the cells ; they have only admittance to five bars. The hive is very full of bees, and the queen breeding fast.

No. 4 is a stock obtained by uniting two lots of driven bees together last autumn ; at their head is a fine hybrid Ligurian queen. These wintered in two nucleus boxes placed side by side, but they only filled one with comb in the autumn. They came through the winter well, and are now fairly strong, but have neither swarmed nor supered. This I attribute to their not making use of the second nucleus box till I shifted half the combs and bees into it at the beginning of June. Strange to say, they have built no drone comb, and there is not a drone to be seen in the hive. I hope still that I shall get my supers finished, and that when the heath comes into full flower there will be a change for the better.—D. D. B.

OUR LETTER BOX.

SWELLED HOCKS (J. H.).—There are two causes to which swelled hocks may be attributed. The first is weakness, and may be the result of overgrowth, or insufficient or improper food. The other is improper flooring. The treatment for the first is to feed well and judiciously, giving plenty of grit and green food ; above all, in such cases, we recommend the use of Sussex ground oats. The only outward application is iodine. The remedy for the other, if the flooring is wood, brick, stone, or asphalt, is to remove it and substitute earth. Not only is there always damp from each of the floors we have mentioned, but from the hard non-yielding surface the toes are kept constantly stretched out, and the legs for hours in a strained and unnatural position. The overgrowth cures itself every day.

POULTRY, &c., DYING (B. C.).—At first sight we should pronounce your case one of poison, and the reason why some died while others escaped would be easily found—all did not eat it. You do not, however, believe in the poison. We fancy the pepper has been administered too freely. We are not friendly to pepper. We have given peppercorns advantageously sometimes, but never pepper itself. If your fields are like ours, the birds would get little from them. They would more likely want cooling than heating things. Have you had any thunder showers ? They will sometimes cause all you complain of. Young Turkeys are very prone to disease very closely akin to, if not identical with the roup, and they are spiritless creatures, giving up directly they are attacked. Their eyes swell, they refuse food, and die. Fowls and Partridges would catch it. Guinea fowls seldom do. It is always a bad plan to keep Turkeys and fowls together if it can be avoided. We believe it to be a case of poison from your description. If it is not, it must be either from sudden and violent rainfall or from roup. We advise you, if you can, another time to keep the Turkeys and fowls apart. Give the former on top chopped fine and mixed with their food. Avoid pepper for them all. When falling give them beer to drink, and let them have camphor in their water. There is nothing better for Turkeys and Pea fowls, if they appear drooping, than to give them two or three pills of camphor, each the size of a garden pea.

KEEPING GEESSE (S. Y.).—For breeding, not more than three Geese to one gander must be kept, and their breeding powers continue undiminished until more than twenty years old. They require a wide range, affording plenty of grass and still water. The goose-house for the four should not be less than 8 feet long by 6 feet wide, and high enough for a man to stand in upright. A smooth floor of brick and good ventilation are necessary. Over the floor a little clean straw should be spread every second day, after removing that previously used, and washing down the floor. A compartment about 2½ feet square should be assigned to each Goose for laying and sitting, and when one is hatching the gander and other Geese must be shut out from here. Whenever a Goose lays her first egg she is very pertinacious in her depositing the remainder. The Toulouse Goose is a very good layer, but rarely requires to sit, and, if she does, is a very bad mother. Where laying Geese are kept together, and they are liable to interrupt each other, remove the eggs daily, and mark on each the day it was laid. They will continue good for three weeks ; but the freshest eggs should be set upon. If the Geese keep well to their separate nests let the eggs remain. March and early April is the best period for goslings to be hatched in.

BLACK SPECKS ON AYLESBURY DUCK'S BILL (Aylesbury Duck).—We doubt whether you will by any means get rid of the black specks. They are very common, and by no means a sign of impurity or degeneracy of breed. They can be rubbed out with pumice-stone, but they often bleed, and the remedy is worse than the disease. There is a sort of sand or grit in Buckinghamshire, which is said to exercise a beneficial influence on the bills of the Ducks. We do not believe anything will remove the black spots. Your feeding is very good, and the birds will yet increase in weight. You are fixing a great task when you seek to attain 18 lbs. the pair.

HATCHING ARTIFICIALLY (A Recent Subscriber).—Whatever the source of heat, the temperature needed is the same, and in answer to your query we cannot do better than give the following extract from our "Poultry-Keeper's Manual."—"Anything will make a hatching-machine in which the temperature can be kept regularly at 104 or 105°. The commonest kitchen oven partly filled with dry sand, and kept at that temperature, will unfailingly hatch eggs. It can be done with greater certainty where gas can be made use of. Hatching is too often to the amateur what marriage is said to be to a man—then his troubles begin. He cannot make a mother. An incubator is useful in hot weather as a means of

providing every hen with a large brood of chickens, but the artificial mother is not equal to a good motherly hen."

CANKER IN YOUNG PIGEONS, &c. (A Constant Subscriber).—Apply a strong solution of alum to the mouths and throats of the birds twice a day with a feather. It may arise from had constitution, or the parents eating dirt with their food, or drinking bad water. Sand on the floor frequently changed would tend to diminish, and not encourage, vermin.

DRIED ASH LEAVES AS PROVENDER FOR COWS IN WINTER (S.).—We have made inquiry amongst our country correspondents as to gathering and drying the leaves of the ash for winter use, but we cannot learn that the practice has ever been adopted in England. The ash plants from which the leaves are taken must be injured in consequence, and, therefore, we cannot recommend the practice except where an ash coppice is to be destroyed. It is perfectly right to endeavour to increase the amount of fodder for the ensuing winter, and we intend, amongst other things, to give our cows a quantity of cut straw mixed with other materials from the miller, and to steam the whole, avoiding as far as possible everything likely to give the milk a taste.

METEOROLOGICAL OBSERVATIONS
In the Suburbs of London for the week ending July 26th.

COVENT GARDEN MARKET.—JULY 27.

VERY little variation is to be noticed here, for although there is a large influx of soft fruit, the market is well attended by buyers to clear it away. The demand for hothouse produce, however, has much fallen off, the London season being over. In the Potato market we find a difficulty in meeting with good rounds, but kidney sorts are abundant and good.

From observations taken near London during the last forty-three years, the average day temperature of the week is 74.6°, and its night temperature 50.6°. The greatest heat was 93°, on the 10th, 1842; and the lowest cold 35°, on the 4th, 1865. The greatest fall of rain was 1.08 inch.

PEA CULTURE.

It is generally recognised as the importance of obtaining a supply of Peas as early in the season as possible, that any mode of cultivation tending to do away with the feeling of uncertainty respecting the success of the first sowings is worthy of attention. I will therefore describe, long before such sowings should be made, a method by which I have been very successful.

A mode of culture now somewhat obsolete, but which, notwithstanding its speculative character, has still its advocates, was to make the first sowing in November, some sowing on a warm sheltered border, while others having greater resources sowed a double quantity—half on the south side of a wall and half in a more exposed situation. In mild winters the sowing on the warm sheltered border would grow so fast, and become so tender, that the first sharp frost would be sure to destroy it. A row or two in the open ground, across one of the garden squares, had a much greater chance of success. This success, however, was never certain; even if the Peas escaped the ravages of the mice and the tender attentions of the sparrows—to say nothing of the operations of snails, which, concealed from view, made their Christmas dinner off the abundance of rich succulent matter with which the gardener had so abundantly stored their winter quarters—the chilly blasts of lingering winter or tardy spring frequently destroyed the young plants.

The way in which I have avoided all this uncertainty and loss has been by sowing in boxes made in the following manner:—Some half-inch deal boards, 9 inches wide, were sawn in halves, and cut into lengths of 3 feet for the sides, and smaller lengths of 5 inches for the ends; these were nailed together, and thus a number of narrow frames were formed, each measuring 4 inches wide, 4½ inches deep, and 3 feet long. Pieces of board were next cut of a suitable size to form a bottom to each frame. The loose bottom boards were ranged side by side on a warm sheltered border, and the frames placed on them, and filled with rich soil, in which the Peas were sown in the second week in January. I may say I was pleased with the plan so far, but then came the thought, "How about the mice and sparrows?" True, I could defy the sparrows by placing some netting over the boxes; but then netting is no protection against mice, and I began to fear for the result, when I suddenly remembered that I had nearly 100 feet of glass on hand, in squares 9½ by 7½ inches, just a handy size for the purpose. Nothing could be better; the entire surface of the soil in the boxes was at once covered with the sheet glass, which not only protected the Peas, but the soil was warmed by the sun heat it transmitted, and the seed vegetated very quickly. The glass was allowed to remain till it was fairly lifted up by the young growth, when it was removed, and laid flat on the soil over another crop which had, meanwhile, been sown in the open garden. As crop followed crop, the glass was kept constantly in use with the best possible results. The

mice were decidedly puzzled, traces of them were visible at places along the edges of the glass where they had tried to burrow underneath, but the labour was evidently too great for one night's work, and before the next night the holes were filled up and traps set. Should any of your readers adopt this means of protection (and I would strongly recommend it to all whose crops suffer from the depredations of sparrows and mice), they will find the size of squares I have mentioned the best for laying lengthwise over rows of Peas.

When the drills are drawn, if the soil is found to be at all dry, it is necessary to give a thorough watering after the Peas are sown before laying on the glass. If the glass is used for the summer sowings it must be removed immediately after the young growth becomes visible, as the sun is then so powerful that it will burn the tops of the young plants if they be suffered to come in contact with the glass.

To return to the first crop in the boxes. When the glass was taken off, as the plants were somewhat tender and, consequently, likely to suffer from frost, stumps were driven in the ground on each side of the boxes, and some slight poles laid across and nailed to the tops of the stumps, thus forming a light framework a few inches above the Peas, on which a couple of thatched hurdles were placed nightly and during snowy weather. As an instance of the utility of the thatched hurdles, I may mention a fall of snow 2 inches deep on the night of March 12th; the morning of the 13th being clear and bright, the hurdles with their load of snow were lifted off, and so the Peas enjoyed the genial sunshine while other things were buried under the snow.

The spring of this year was so cold and changeable that the Peas were not turned out of the boxes till April 1st, when a narrow trench was made to which they were taken one by one, the loose bottoms removed, and the sides, after a slight shake, lifted up, leaving the Peas in the trench, where the lengths were fitted against each other, forming one long row. The soil was a mass of roots, so that the wooden sides were drawn off without any mishap.

After the Peas were planted out the frames were again placed on their moveable bottoms, filled with soil in which some dwarf Kidney Beans were sown, and set under the stage of a vinery at work. In six days the cotyledons were to be seen forcing their way through the soil, and the young plants were at once taken out of the vinery, and the boxes once more occupied their original position. The Beans were protected for awhile at night by the hurdles, and at length turned out in a warm border. Thus two early crops were obtained by means of these useful boxes.

In concluding this paper, a few remarks on Pea-culture generally may not be out of place. One of the chief points is the maintenance of a constant supply of young Peas throughout the season, and as an important means to this end, well-tried sorts only should be selected. If novelties are cared for (and they should certainly have a trial), a small quantity may be sown, but they should form no link in the regular cropping. Dwarf-growing kinds are

as a rule, best suited for small gardens, but in large gardens the tall kinds are best.

In making a selection of the best sorts, to be sown in the order in which they are named, I would choose Ringleader, Climax, Laxton's Prolific, Champion of England, King of the Marrows, British Queen, Veitch's Perfection, and Ringleader again for a very late sowing. As to the time of sowing, monthly sowings should be made in January, February, and March, and fortnightly sowings in April, May, and June; after which time two or three successive sowings of Veitch's Perfection and Ringleader are useful to prolong the season should it prove favourable.

Peas flourish best in a deep rich soil, in which the roots penetrate to a great depth, and, therefore, wherever the soil is poor or very light, and manure scarce, the latter should be put in trenches as for Celery plants, and the Peas sown in the soil covering it. A thin dressing of manure spread over the surface of the soil and forked in, will be of very little service to the Peas. As I have found it necessary to use trenches for Peas in the garden here, the plan followed is, when arranging the ground for cropping in spring, to leave spaces about 20 feet apart across the garden squares, each space to be occupied by a single row of Peas. The trenches are opened, the dung wheeled in, and the whole of the spaces fully prepared before spring comes on, so that nothing is left to be done when the Peas are sown but to draw the drills in the usual way. I have now a large breadth of Potatoes intersected in this manner with rows of Peas, and as the crops are all flourishing and the Pea rows at a uniform distance from each other, the whole has a very neat appearance.—EDWARD LUCEHURST, *Egerton House Gardens, Kent.*

A PLEA FOR DOUBLE-FLOWERED PELARGONIUMS AS BEDDERS.

"THEY will never do as bedders," is the remark one constantly hears concerning these brilliant novelties. "They are so scant in their flowering, and they are so thick in the truss, that they will be matted together like the Hollyhock in wet weather." And so I thought too, but a little longer experience has caused me to alter my opinion, and I am now inclined to think that in a little time they will become very great favourites. We shall have to discard the originator of the new strain Gloire de Nancy, and any others that partake of its very gross habit; but we are gradually obtaining varieties of a dwarfer habit, and it is to these I look. I have a long border running down my small lawn, and have planted in it various kinds of Pelargoniums, dividing the sorts with a band of Perilla. We had heavy rain on two days, but on looking down the border on the evening of the second day, my eye rested at once on the greenest and most brilliant-looking spot in it—where some of the doubles were planted; the rain had not injured them, and their large, massive trusses shone out above the green foliage. When I say that I had in this border Excellent, Lord Derby, Editor, Sir Fitzroy Kelly, Chieftain, and Miss Martin, I think this is saying something for it; and when we can multiply such kinds as Wilhelm Pfitzer and Marie Lemoine, they will form striking objects, while in a dry season, such as we had last year, they are admirable. There are no seed pods, and the bed is therefore not disfigured by them, so that as the propagating season has now begun I would suggest a trial being made, and I do not fancy those who may make it will be disappointed.—D., *Deal.*

BERBERIS DARWINII.

Or the hardy berry-bearing shrubs that are commonly grown for pleasure-ground ornamentation, there is none that I have seen to equal *Berberis Darwinii*. It is suitable for very nearly any position, it will stand wind and wet well, is perfectly hardy, and is very attractive at all times. Since its ornamental qualities have become better known I see it is being used in park planting; a group of from seven to twenty or more plants will in a comparatively short space of time form an almost impenetrable thicket of wood and foliage, the branches growing close to the ground. Its orange-coloured flowers are produced in great profusion, and it is then a conspicuous and ornamental object when viewed from a distance; and afterwards its slate-coloured berries, which are as numerous as its flowers, make the plant not less attractive to the passer-by.

In my opinion one of the most suitable positions that can be assigned to such a desirable shrub is by the side of a car-

riage drive, whether planted singly or in groups of three plants here and there, and associated with taller-growing plants. Where circumstances are favourable to such an arrangement, I think it will not fail to please. Of course in such positions a good-sized bushy plant rather than a very tall one will be the best to grow, but as its habit is favourable, and its growth vigorous, these proportions will soon be reached. A little guiding, however, will be necessary, by giving an annual pruning of all gross shoots, which the plant is apt to throw up after it has become established. This pruning will favour the production of flowers and, consequently, fruit, because it is on the medium-sized wood that these are most abundantly formed.

This beautiful *Berberis* is often to be seen growing at the front of shrubbery borders, or round the margin of shrubbery beds. These I consider are very suitable and proper places for such a useful plant. The plants are here growing in such positions in great numbers, and nothing could better suit the purpose for which they were planted. I do not advise planting them as some do in the background of a shrubbery bed or border, among coarser-growing subjects; they are there seldom fit to be seen, and are in time quite overgrown by their more vigorous associates.

To keep the plants in good health, the surface soil around them should never be dug, but only stirred, as the roots are very near the surface. There are few places where this *Berberis* thrives better than it does here, in a very heavy loamy soil approaching a clay. Although it will thrive tolerably well in a light soil, I consider a heavy one the most suitable; the foliage is then darker, and the colour of the flowers a beautiful orange yellow.—THOMAS RECORD, *Lillesden.*

NEW AMERICAN POTATOES.

In April last I planted 1 lb. each of Bresee's King of the Earlies (four Potatoes, sixteen sets), and Climax (three Potatoes, twenty-three sets), and have taken up the produce to-day (July 25th), with the following results—King of the Earlies, 18½ lbs., largest Potato, 5½ ozs., many about that size; Climax, 39½ lbs., largest 14 ozs., no other near that size.—W. J. S., *Devon.*

PRUNING ORNAMENTAL TREES AND SHRUBS.

No. 5.

Portugal Laurel.—Under most conditions this is a handsome shrub, but is never so fine as when subjected to judicious, timely pruning. It requires plenty of room, light, and air, though, with pruning at an early stage of growth, and continued annually or biennially, it may be kept in comparatively small space. In shrubberies, however, the plants ought not to be very closely pruned, but I consider it necessary to go over them every spring and well cut back any irregularities; indeed, whenever there is very free growth the shoots, from being long, are apt to start from the points only, and the tree becomes open and bare of foliage unless the long annual shoots are pruned in well every spring. If height be wanted, the pruning may be confined to the sides of the tree, but I would, nevertheless, shorten the shoots near the top, as stronger, more regular growths are produced from the ripe than the sappy points of the shoots. Should the trees have become too large, they may be cut back to the size required, and in a year or two they will exhibit a close leafy growth. When of the desired size the pruning should be performed every year in April, cutting off most of the preceding year's growth, which will be replaced by that of the current year. Of course, where there is room, all the pruning required is confined to cutting off any growths likely to interfere with the symmetry of the tree.

Standard Portugal Laurels have so close a resemblance to the Orange and Sweet Bay, that unless closely examined by a practised eye they are hardly distinguishable; but it is seldom we see Orange trees so leafy and healthy as to be presentable as summer ornaments in English gardens. Portugal Laurels, on the contrary, are quite hardy, and succeed both in summer and winter in all but very bleak situations, being, in point of hardiness, vastly superior to the Sweet Bay, which only succeeds in warm situations; hence the necessity of growing the latter in tubs for removal in winter to a place of shelter.

Portugal Laurels grown as standards may have stems of any height, but I consider 3 or 4 feet sufficient. The plants intended for standards should be trained with one straight clear stem, and those raised from seed are to be preferred. To give

stability to the stem it is well not to cut away the side shoots, nor shorten them very closely until the required length of stem is obtained, as well as a head large enough to shield it from the sun, or say of 2 feet in diameter. The leader must, of course, be stopped when it attains the height desired, and the shoots that result from the stopping should have their points taken out when they have grown 6 inches, and I would again stop them when that length of fresh shoot is made; for, though we may obtain a larger spread of head in the first two or three years by allowing the shoots to grow at will, or with but little shortening the first few seasons, the head will be for the most part bare of foliage near the stem, and to clothe them there we have to begin over again. On the other hand, by attending to the stopping of the shoots in the first instance, we secure a close leafy growth from the first, and maintain it by a system of close pruning. Thus, though the annual progress may appear small, the trees from the first are compact.

The first shoots should be brought down at the end of summer to a horizontal position, and be secured with matting to the stem. Unless this be done they have a tendency directly upwards, and once they are allowed to take this direction it is difficult to get the side shoots sufficiently low to hide the setting-on of the head; but when the shoots have an outward tendency it is easy to maintain that character of growth. When the head has grown to the size already stated, the shoots on the stem should be gradually removed, and finally cut off close to the stem, and by a clean cut with a knife; though allowed to remain for a time, they must always be kept secondary to the head by close stopping. Another point to be attended to is keeping the head flat or table-like for a few seasons; therefore, the shoots produced on the top of the head must be more closely stopped than those at the sides, so as to cause more vigorous growth outwards or at the sides. When the desired breadth of base is secured the centre can soon be filled up, as the growth is always more free in that part than in the horizontal side branches. Nevertheless, we must not allow the centre to fill up too quickly, but by frequently stopping and shortening the shoots we must endeavour to secure a close growth, which is very important in geometrical and architectural gardens.

The form of head is a matter of taste. Half spheres are pretty, and pyramidal heads are effective, whilst columns but little wider at the base than at the top are equally desirable. I may be thought restricted in my views, but I cannot forbear expressing my admiration of a fine line of Portugal Laurels on stems of equal height, and with symmetrical, even-sized heads, on a wide terrace of velvety lawn, green to their trunks, and with a wide walk running between them—a line being on each side of the walk. When desirable the plants may be in tubs, but they do not grow so well in this way as when planted out, and it is necessary to protect the tubs with straw in very severe weather, otherwise the roots will be injured, and in the case of standards the stems require to be wrapped round with hay-bands to preserve them from severe frosts. In bleak exposed situations they should be removed to a sheltered position in winter.

The *Sweet Bay* is one of the best of all trees for forming pyramids, and even standards, but except in warm situations it does not succeed in tubs in our climate, requiring protection in winter. Standards, as a rule, are not generally successful; pyramids are much to be preferred. They are formed in much the same way as pyramidal Hollies, and the same remarks apply to pyramidal Portugal Laurels: therefore it will be needless to give further instructions for their formation, and I shall dismiss them by stating that in winter Sweet Bays should have a warm sheltered position, the tubs being well mulched round with dry litter, and in case of very severe weather they would be the better of a cool house.

Laurustinus is another of those subjects which form handsome pyramids and dwarf standards, and these, in their formation, require the same treatment as Hollies. The best time to prune them is immediately the flowering is past, and then they may be cut in little or much as required. When grown in tubs they require to have a sheltered position, and in severe weather protection like the Portugal Laurel and Sweet Bay; indeed, they are well worthy of glass protection, and are much in demand on the Continent both for out-door and in-door decoration. The *Laurustinus* is well suited for the decoration of corridors, halls, and cool conservatories during the winter months. They are fine whether grown in pots or tubs.

Box is not much in repute, except for general purposes in shrubberies, though for forming small cones, and for bushes of

any form, there are few trees to equal it. Box trees thus trained have the disadvantage of becoming loose and open, and that, too, when of considerable size; but this might have been remedied by commencing the pruning in the early stages of the plant's growth, and continuing it annually, so that the growth becomes stiff and branched instead of long and but little forked. The main point to be attended to is to well furnish the plants at the base; to secure their being so cut-in the upper part more than the lower, and thin out the shoots in the thick parts, so as to encourage the growth of the thin. If that be attended to once a-year, or even every two years, the trees will be very regular and close. If the lower parts are very weak and thin, it is advisable to leave them almost entire, only cutting off the long straggling parts; but the upper portion of the plant should be cut-in closely a fortnight or three weeks after the lower part is pruned.

The best time to prune is in May or early in June in moist weather. At that time the trees may be cut-in to any extent, and will soon push again, and be quite green before winter. Any irregularities of growth may be removed in August or early in September. The pruning, of course, must be such as to allow a progressive growth; but when the trees are of the size required they should annually be cut-in closely, or, if the growth is weak, every alternate year will be sufficient. Those which are of weak growth ought to be pruned earlier than those which are strong, as by pruning the latter after they have made some growth they do not get so strong as when pruned while at rest. Pruning when a tree or shrub is at rest, is favourable to an increased vigour, but pruning a growing tree has a contrary effect.

The best kind of Box for pyramids, bushes, and trees, is the Tree Box, which in some soils and situations attains a considerable size, and is a handsome tree. The best variety of it for pyramids is *pyramidalis*; and *B. balearica*, the Minorca Box, is good. The silver-variegated and the gold-variegated form fine bushes and pyramids for the winter decoration of the flower garden; in summer, even, they have not a bad effect as neutrals, as centres to large beds or detached.

Box makes an excellent low screen, being better for the purpose than either Yew or Holly, being more easily kept in form.

Common Laurel.—I can say but little of its merits for training as a cone or pyramid, but those who wish it in these forms may pursue the treatment recommended for the Portugal Laurel.—G. ABBEY.

"REDCARRE, A POOR FYSHER TOWNE."

THAT is the description in one of the Cotton MSS. in the British Museum, of the place whence I am now writing, and the MS. proceeds saying, "The sea shells and sand serve instead of marle to enrich the land, which is fruitfull of itself, but much bettered by the neighbourhood of the sea, makinge the good husbendes of the lowe grounds fatt in the purse, and merry in the hearte." The said sea-sands, however, and they are vast, do not so benefit and make merry the denizens in Redcar. I have read of sand storms and sand-buried cities in the East; I have been dredged thoroughly with the red sand of the Cape of Good Hope; I have been near the exhumed Cornish church, Peranzabuloe, but never until I rested at Redcar could I realise the silent conquests by the sand. Whilst I write a half-gale from the north-east is blowing, no clouds of sand are raised, but it flows in ripples along the ground and rapidly accumulates in heaps against any opposing object, and soon forms a hillock. The scavengers are now carting away loads that accumulated in one mound before the window where I am now sitting. A former visitor was similarly surprised at this rapid sand-accumulation, and not seeing any mode of rescue, on asking a man how he extricated his cottage from the sand, he felt rather humiliated by the reply—"Why, I shovels it away."

"The husbendes of the lowe grounds"—the Cleveland Vale—will this year be "fatt in the purse and merry in the hearte," if the weather of harvest-time be propitious, for never did I look upon heavier unladen crops of Wheat and Oats, better-podded Beans and Peas, or more perfect plants of Swedish Turnips. I remember the time when a field of Swedes was very rare, but now white Turnips are the rarity. Winter keep, therefore, will not fail the noble Teeswater, or Holderness kine which prevail along this valley. "The sea-shells and sand," I am pleased to see, are not the only enrichers now from the sea used by the Cleveland "husbaudes," for I see pastures recently and judiciously sprinkled over with sea-weeds. I say "judiciously,"

because they are so thinly scattered as to shade and shelter but not to blanch the grass. Their saline and organic constituents gradually fertilise the soil.

Let it not be supposed from the quotation with which I have headed these notes, that I consider it still applicable. Those words might have been appropriate two centuries since, but they are used by me only as a striking contrast to a fair description of Redcar, as it is now a thriving, increasing town, supplied with all the requisites of a sea-bathing resort, and with unsurpassable sands for exercise. On foot, on horseback, or in a carriage, those firm stoneless sands, hundreds of yards wide, and more than seven miles in length, may be traversed. Many places of interest, too, are within easily-reached distance on foot, by railway, and by carriage, but at present I must confine my notes to one day's stroll.

That stroll was to Kirkleatham and a few miles beyond, little expecting to find hereabouts monuments—worthy monuments, of a Lord Mayor of London; yet in the church there rests Sir William Turner, chief magistrate of your city in 1669, one of its most wealthy merchants, and the frequent creditor of Charles II. He founded at Kirkleatham a noble hospital for aged men, aged women, and children; a museum, a library, and a free grammar school, but this last-named is now rebuilt at Redcar. I presume he was a native of Kirkleatham, and I was well pleased to rest beneath venerable trees whose shade he must have often enjoyed. Not many years since one of their companions was felled, and then rifled for firewood, in doing which the heart of the tree turned out entire, and on it, spirally written, were these two lines—

"This tree long witness bear,
Two true lovers did walk here."

The portion of the tree with its inscription is preserved in the Turner Museum I have mentioned. The inscription is perfectly legible, and is literally as follows—

"This tree long time witness beare
Of tow lovers that did walk here."

A poet has written on this theme, but I will only quote the first and last verses:—

"Long the wintry tempests braving,
Still this short inscription keep;
Still preserve this rude engraving,
On thy bark impured deep—
'This tree long time witness bear,
Two true lovers did walk here.'
On thy yielding bark engraving
Now, in short, our tender tale;
Long, time's roughest tempest braving,
Spread thy branches to the gale;
And for ages witness bear,
'Two true lovers did walk here.'"

Passing on I soon reached Wilton Castle, a residence of Sir Charles Lowther, Bart. The village is within the park's boundary, and if any one wishes to see model cottages, church, and graveyard, they are there. Never did I see such appropriate, uniform neatness. The cottages are examples of cleanliness and comfort, they make one feel how such dwellings must tend to promote a love of home and self-respect in their labourer tenants. To them with truth—would that I could say the same of all in England—may be applied the verse—

"The cottage homes of England! how cheerily they stand,
Abodes of comfort and content throughout the pleasant land."

The gardens of Wilton Castle are of very limited extent, which is fortunate for the gardener, Mr. Henry Reed, for as there is only one small greenhouse, he would be unable to winter the bedding out plants required for extensive flower borders. The great charm of the place, however, is in the extensive walks through the wood-clothed hills; these wide, well-kept walks are delightfully shady in summer, and, facing the south, are sheltered and enjoyable in the fine days of winter. There is a large picturesque waterfall, but the dry summer we have had prevented me seeing it in its full beauty. The Magnolia was in bloom, and the Figs ripening against the south front of the Castle, and an abundant crop of Noopark Apricots are on a wall having the same aspect in the kitchen garden—it deserves a note that they had no protection of any kind during either the winter or spring, though at this north-east corner of Yorkshire. The whole are well-ordered by Mr. Reed, and one of your Editors will say he is a man of judgment, for among his books I saw London's "Encyclopedia of Plants," Lindley's "Theory of Horticulture," and Johnson's "Cottage Gardeners' Dictionary."—G.

DENDROBIUM MACCARTILE.—This beautiful Orchid is just now in great beauty at Messrs. Veitch's, Royal Exotic Nursery,

Chelsea, where there is a plant with no less than one hundred expanded flowers.

THE EVERGREENS OF CALIFORNIA.

PERHAPS no country in the known world has been more liberally favoured with all that is grand and beautiful in vegetable life than has California. Whether we are particularly interested in the smallest plants with their gorgeous flowers, in ligneous shrubs clothed in attractive foliage, and emitting delightful fragrance, in deciduous trees with a semi-tropical aspect, or, lastly, evergreens of the most imposing and elegant forms—the Sierra Nevada range of the "Golden State" cannot be surpassed in richness.

I purpose to call attention exclusively to the various members of the order Conifera, and especially to those which I have studied in all the glory of their native haunts.

In the Pine family proper, I will commence with the *Pinus contorta*, Douglas (Twisted-branched Pine).—A medium-sized tree, rarely growing more than 50 feet in height, but forming one of the most beautiful and compact specimens I have ever seen. They are never found in the valleys, but always near the summits of the higher ranges, especially surrounding some level plateau, where the soil is damp and cool. In such situations it is of moderately rapid growth, very dense in structure, bright glossy green in colour, and regularly conical in outline. It is closely allied to the *P. inops* (Yellow Pine) of the Atlantic coast, although far superior to the latter as an ornamental tree.

Pinus Fremontiana, Endlicher (Fremont's Pine)—Is found at high elevations on the mountains, and is another of the smaller-sized trees, which will undoubtedly prove very attractive in our collections. The leaves of this species present a very curious feature, being almost entirely monophyllous—i. e., one leaf in a sheath on the younger shoots, and of a bright bluish green in colour. The branches, although not so numerous as in the preceding, are nevertheless sufficiently so to form a moderately-compact head, and when viewed in conjunction with the very attractive foliage, leave little to be desired. The cones are small, and of a greenish tinge on the surface; when open, displaying a few large edible seeds; these are in great request by the Indians, and are very nutritious and agreeable to the taste.

Pinus edulis, Engelmann (Edible-fruited Pine)—Closely resembles the foregoing, the distinctive feature being in the size and shape of the cone. Young plants of this species have proved quite hardy in the Eastern States, and I trust we shall thereby secure a valuable addition to our collection.

Pinus ponderosa, Douglas (Heavy-wooded Pine)—Is seen soon after commencing the ascent of the mountain range, and is one of the most numerous species until we approach the summit, when it ceases to be met with. In passing through the almost interminable forests that clothe these regions, we see many thousands of the Heavy-wooded Pine of all ages and sizes, from the handsome-shaped specimen of 8 or 10 feet in height, to the old scarred veteran towering up at least 150 feet. In the case of the latter, the rough, deeply-seamed bark presents a curious appearance. Indeed, the whole tree forcibly reminds one of a vigorous specimen of the Austrian Pine (*Pinus austriaca*), but much coarser in growth than the latter species. As a strictly ornamental tree, it will, therefore, never prove popular, but in our larger plantations, on rocky eminences, and for distant belts and masses, it will be available and useful. One of the largest specimens I have seen was growing in the beautiful valley of the Yo Semite, and measured 21½ feet in circumference 5 feet above the ground. I frequently met with trees from 15 to 18 feet in girth, and, in fact, the larger portion of them were at least 4 feet in diameter, with their huge bodies destitute of limbs for at least one-half their height.

Pinus Jeffreyi, Hort. (Jeffrey's Pine)—In size and appearance of tree presents all the characters pertaining to *P. ponderosa*. The cones, however, are very different, and herein alone exists the specific distinction. Occasionally I have noticed a chance specimen with more slender leaves, but this peculiarity is not constant. It is hardy, a rapid grower, and would make an admirable shelter.

Pinus Sabiniana, Douglas (Sabine's Pine)—Belongs entirely to the Foot Hills at the base of the mountains, and in consequence will prove of doubtful utility with us. Indeed, I do not know of an instance where it has proven successful; but, nevertheless it is remarkably elegant when young, presenting one of the most charming examples of the delicate graceful type of Conifers to be met with. The foliage is about 12 inches

in length, very slender, and of a peculiar light bluish green colour. All the young shoots are likewise tinted with a pretty glaucousness, thus adding to its charms. The older trees do not attain a large size, and differ from other species in the form of the head, which is always branched at the summit, and spreading after the manner of many deciduous trees.

Pinus Torreyana, Parry (Torrey's Pine)—Greatly resembles the foregoing in manner of growth and general appearance of foliage. If hardy, it would prove a decided acquisition here, but from its close affinity to the Sabine's Pine, and its still warmer locality, I very much doubt its utility with us in the Middle States.

Pinus insignis, Douglas (Oregon Pitch Pine, Seal Pine, &c.)—Is found along the coast near San Francisco, and is frequently seen in cultivation in the gardens of that city. When young the trees are remarkably dense and elegant in appearance, but the mature specimens present rather a ragged and open structure. The *Pinus radiata* of Don is not distinct from this species.

I now arrive at the grandest of all our Pines proper, *Pinus Lambertiana*, Douglas (Sugar Pine, Lambert's Gigantic Pine, &c.)—This species is even more sub-alpine in its choice of location than *P. ponderosa*, and, as a natural consequence, is entirely hardy with us. The sight of these great trees rising in the air to the height of 150 and 200 feet, with a clean shaft of 75 or 100 feet without a limb, presents a grand spectacle. I measured a large number of specimens, varying from 20 to 25½ feet in circumference, and it was no uncommon sight to see several of this size standing close together. The ground beneath was usually covered with huge cones, which were often at least 20 inches in length. The leaves are not unlike those of the *P. Strobus* (White Pine), excepting that they are more rigid, and of a darker green in colour.

Pinus monticola, Douglas (Short-leaved Weymouth Pine, Mountain Pine)—Also closely resembles our White Pine, but has a larger cone, and rather shorter leaf. It grows to a large size, and is entirely hardy in our climate. I only noticed it in localities where the preceding species was growing.

Leaving the Pines, we now pass to the next genus of importance—the Abies or Spruce family. Soon after commencing the ascent of the mountain ranges, we find specimens of *Abies Douglasii*, Lindley (Douglas's Spruce), and as we rise still higher, a large portion of the forests are composed of this tree. The younger specimens are really charming; not only on account of the rich glossy green colour of the foliage, but more particularly for the graceful drooping habit of the branches. As to their size, I measured many trees whose bodies were from 15 to 18½ feet in circumference.

Abies amabilis, Lindley (Lovely Silver Fir)—Is justly named, for the most indifferent observer of trees could not possibly pass through the great forests of this species which clothe the summits of the Sierra Nevada without experiencing a feeling akin to awe. So dense is the verdure and so numerous the trees, that the darkness on our path induces the belief that the dusk of evening is near at hand; and yet, as we emerge from these vast clumps into a cleared space, where the bright sunlight glances through the foliage, the effect changes, almost like a kaleidoscope, into the most brilliant tints of blue and green. Such is the aspect of the Lovely Silver Fir. In size I may say they form no exception to the neighbouring trees, for I saw very many that were from 20 to 23½ feet in circumference, and with a naked body of 100 feet in height, the foliage branching out in a dense mass at the summit.

Abies grandis, Lindley (Great Silver Fir)—I found in the same localities as the preceding, and about equal in size and number. Well does it merit its name; and had I even the time to give you a perfect description of its surpassing beauty and grandeur, I could not do it simple justice. It differs from *A. amabilis* in having the leaves arranged strictly in two rows, long, and slightly incurved at the extremities. The colour is pale green, but the great height of the old trees—200 feet and upwards—leads one to believe that the foliage is exceedingly dark. The odd-looking cones stand erect on the summit, and are rarely seen on the younger plants.

The only Juniper I noticed in California was the really beautiful *Juniperus occidentalis*, Hooker (Rocky Mountain Juniper). A specimen is found on one of the highest peaks near the Yo Semite Valley, where the bleak winds and cold storms for many years have not marred its symmetry. The silvery foliage, thickly interspersed with purplish-brown berries, presents an agreeable picture to the lover of trees. I am happy to say it succeeds well in our Eastern collections.

One of the largest trees to be found in California, excepting only the Sequoia, is undoubtedly the *Libocedrus decurrens*, Torrey (incorrectly White Cedar, in its native locality). Many of you will doubtless recognise it as the *Thuja gigantea* of foreign nurseries and authors, and as such introduced into our collections from abroad. I found vast numbers of it on the steep mountain sides at high elevations, and especially in the vicinity of the Yo Semite Valley. The trees, when young, are very handsome, forcibly reminding one of a fine specimen of Arbor-Vitæ, but much more glossy, and lighter in colour. The finest specimen I saw was 25½ feet in circumference, and over 200 feet in height.

Taxus brevifolia, Nuttall (Short-leaved Yew)—Forms but a small shrub in California, although further north it assumes the proportions of a tree. In foliage, it approaches more nearly the handsome *T. adpressa*, of Japan, than any other species. The brilliant scarlet fruit, scattered thickly over the plant, contrasts charmingly with the dark glossy-green of the leaves.

Torreya californica, Torrey (Californian Nutmeg Tree)—Is quite rare; but I was fortunate in finding a very fine specimen on the cliffs at the foot of the Yo Semite. It is Yew-like in character, forming a medium-sized tree, with long, dark-green glossy leaves, very sharp-pointed. The fruit, as its name suggests, is not unlike a nutmeg in appearance, but totally unfit for use. I am afraid it will not prove hardy here; but should it do so, we may anticipate much pleasure in its introduction.

I close my descriptions with the most majestic of all our native trees, the *Sequoia gigantea*, Torrey (Great Tree of California), and popularly called "Washington" and "Wellingtonia." During my journey over the Sierra Nevada Mountains, I had the pleasure of visiting the extensive group known as the Mariposa Grove, embracing the largest trees to be found. I shall not soon forget my feelings, when, after having ridden all day through forests of great Pines and Firs, I emerged suddenly into a little valley, and found myself surrounded by these wonderful trees. The abrupt change in character was so new, and almost incomprehensible, that I lingered among these strange forms until the quickly passing hours warned me I should once more be obliged to resume my journey towards civilisation. The casual observer cannot at first comprehend their immensity; but standing close by their sides, and looking steadily up into their great shaggy tops, the vastness and sublimity of their proportions almost imperceptibly steal upon the senses.—JOSIAH HOOPER, *Westchester, Pennsylvania*.—(*American Gardener's Monthly*)

MYATT'S FILBERT PINE STRAWBERRY.

I DOUBT whether Mr. Creed (page 58) has the true variety. Mine, which came from Mr. Turner, instead of coming into bearing with Black Prince, are decidedly late, as pointed out in Dr. Hogg's "Fruit Manual," and runners, so far from being plentiful, are late and scarce. Indeed, it is probably from this latter circumstance that so high-flavoured a variety is seldom seen in cultivation.—G. S.

LAWN MOWERS.

I THINK all who have worked the Archimedean lawn mower will agree with me that "VITIS," in writing about it (see page 25), rests too much on its inferiority to Green's machine. I cannot speak ill of the latter, nor do I give the Archimedean the preference, but who can say a 14-inch Archimedean is hard work for two strong men? I have one of that size here, and can testify as to the small amount of exertion required to use it; and more, I can confidently and truthfully say that there is no other machine to approach it for ease in working. As to its cutting long grass, it does it well, and with comparatively little labour, although it is a quality not much needed, as a lawn, to look well, ought never to be allowed to grow more than a week without mowing. With regard to the machine clogging quickly, I have never found it do so, not even when the grass was very wet. What machine has cutters capable of withstanding, without being notched, contact with stones? As to a small stick, I think it would have but little effect. If the blades of the machine "VITIS" has are notched and look like a saw, his lawn must be extremely stony. I never sweep after mowing, nor is it necessary, as not a trace of cut grass is to be seen after a few hours.

I agree with "VITIS" as to the Archimedean not cutting close to a flower bed, and the shorter the curve the greater the

objection, owing to the skids protruding so far that in going round they thrust into the bed and injure the plants, but verger I can and do cut with it. Another objection is that it does not cut quite so closely as I should wish; but this objection will, perhaps, be all in the machine's favour, as in a more growing season than the present the cut grass will be more readily lost to view than if it were shaven off close to the ground, which would tend to give a rusty appearance.

I do not pretend to say that the Archimedean is the height of perfection, far from it; there is room for improvement, but it is a great advance in the way of diminishing labour. We must also bear in mind that since Green's and other machines came into use great improvements have been made in them, and I have not the slightest doubt but that our American cousins will eventually make as great an improvement on the Archimedean.—E. Morgan, *The Butts, Harrow-on-the-Hill.*

HORTICULTURAL CONGRESS AT OXFORD.

(Continued from page 65)

THE next paper read, was that of Mr. William Paul, of Waltham Cross, viz.:—

ON COLOUR IN THE TREE SCENERY OF OUR GARDENS, PARKS, AND LANDSCAPES.

LAST year I had the privilege of reading a paper at the Manchester Congress of this Society, "On the Improvement of Races," which subject may be said properly to belong to the "science" of gardening. To-day I have the pleasure of submitting to you my thoughts "On Colour in the Tree Scenery of our Gardens, Parks, and Landscapes," and here I find myself dealing more directly with the "art" of gardening. While fully recognising the progress, both in the art and science of gardening, which has taken place in my day, I yet think that in this outlying but important province, our professors have not made so free and effective a use as they might have done of the various tints of foliage which are to be found amongst trees and shrubs. Lest I should be misunderstood, permit me to state at the outset, that I hold the prevailing green with which the earth is clothed to be the best colour that could have been devised for the purpose, as blue is the most appropriate colour for the sky. But the sky, which is beyond our reach and power, is naturally subject to constant and considerable variation, and is singularly free from monotony. It is not altogether, or long together, of one colour. There are light fleecy clouds continually breaking up the hemisphere of blue; varying in substance and colour; sometimes hanging motionless, but oftener sailing noiselessly along, more or less rapidly, and every moment changing in form. Then there are the dark thunder clouds, and the golden, silvery, purple and roscate hues, which often give both life and brilliancy to the morning and evening sky.

But we have the power given unto us to vary and adorn the surface of the earth, and I would here invite public attention, and invoke the artist's aid in behalf of colour. There appears to me a monotony on the face of our English landscapes arising from one uniform and all-pervading colour—green. This monotony I would seek to remove by the introduction of trees with purple, white, and yellow leaves. With the same end in view, I would also plant more freely the transitory red, yellow, brown, and purple tints of spring and autumn, supplementing these effects by the introduction of berry-bearing trees—trees with white, red, black, and yellow berries, and trees with white, red, and yellow bark for winter ornament. With these preliminary remarks I shall endeavour to show—1st, that the object I seek is desirable; next that it is attainable, and shall conclude with a few general remarks and brief examples in support of my views. I am free to confess that there is nothing in the whole range of Nature which yields me more pleasure than the contemplation of a beautiful landscape. To stand on some elevated spot in the English or Scotch lake district, for example, and look down on a broad and varied expanse of country; to row upon the surface of the lake, and look upwards upon the towering masses of rock and tree; to trace the lake shores, the lake islets and waterfalls, is, I believe, a recreation of a higher intellectual and more æsthetic order than the many who have not practised it might, at first sight, take it to be.

A highly cultivated American gentleman once said to me, "England is a series of varied and improved landscapes. Now and then in remote districts one catches a glimpse of Nature, unaided and unadorned, but generally throughout the length and breadth of the land high art has been so skillfully applied as to effect the artist's object without leaving behind any traces of the artist's hand. But I miss the brilliant autumnal glow of the American forests: your landscapes lack colour." This very nearly expresses my ideas of English scenery; the natural beauties of our landscapes have in many cases been improved or developed at a sufficiently distant date, that the old and the new have become blended in one harmonious whole, leaving no strong lines of demarcation between the work of Nature and the work of Art; but the landscapes are generally cold and monotonous—wanting in variety and colour.

If we proceed to analyse a beautiful English landscape we shall find it composed of diversity of surface, light and shade, wood, water, rock,

and many minor accessories, which may or may not be present, either singly or in combination. These I mention not to dwell upon, but to dismiss, as the recognised features of the landscape. My business at present is with tree scenery, and principally with one feature of it—colour. Our earth tints are prominently neutral, often sombre, and to correct this should, in my judgment, be a leading idea with the true artist in landscape gardening. A piece of country, however beautiful by nature; a garden, however perfectly planned, yields more or less pleasure according to the skill and taste exercised in the planting, just as the proportions and beauty of the human form are improved or otherwise by the style of dress—trees, shrubs, and flowers constituting, in fact, the exterior dress of the garden and the landscape. Now, it must be patent to those even who are but slightly acquainted with this subject, that the labour of our plant collectors abroad, and plant cultivators at home, have placed within our reach many trees with coloured leaves—purple, yellow, and white—of various shades, and I hold that these colours should be so blended with the prevailing green as to remove the monotony which at present obtains. That the effect of colour in the landscape would be generally appreciated was once brought home to me in a peculiar manner. I was riding in company with some friends through the park at Chatsworth, in Derbyshire. Suddenly we sighted a tree with reddish-brown leaves rising from the green sward, and surrounded at some little distance with the usual green trees. Remote as it was, we could not at the moment make it out, but all admired it, and agreed that it was at once telling and beautiful. Led by admiration as much as by curiosity, we approached it, and discovered a dead tree retaining its reddish brown withered leaves.

I think that any cultivated observer who may dwell ever so briefly on the tree scenery of Great Britain will admit that the contrasts of colour, weak and little varied as they generally are, present to him one of its most pleasing features. If, then, the slight existing variation of colour, restricted principally to the contrast between light and dark green, is admitted to be an element of beauty, may we not justly infer that we should gain something if we varied and increased the contrasts by the use of stronger and more distinct colours? I think, then, that I may fairly assume that, on a free and full consideration of this subject, it will be generally admitted that a greater variety of colour would be an improvement in the tree scenery of our English gardens, parks, and landscapes.

I have next to show that the object I seek is attainable. The arrangement of the colours of flowers in the flower garden has of late years been worked out with wonderful skill and effect. What were our flower gardens in this respect thirty years ago? I remember that results predicted then were considered impossible by the many, although they have been accomplished, and more than accomplished, long ago. Now, as far as I am aware, no one has yet applied the same principles in the arrangement of trees and shrubs with coloured leaves. I have been told that it cannot be done. But after a long study of the question and numerous experiments, I have come to a different conclusion, which I submit with all deference to those who think otherwise. I believe that here, as in the flower garden, there only needs a beginning, and progress will be rapid and success certain.

Many years ago I formed a collection of pictorial trees and shrubs, and planted them closely together, with the view of watching their development and eradicating those kinds which might prove undesirable on more mature acquaintance. This plan I vigorously pursued, and now find myself in possession of a select list, which I believe is sufficient to carry out all that I shall advance.

In addition to the ordinary or prevailing green, I find that I have five colours, or tones of colour, with which to work:—1, Light green; 2, Dark green; 3, Reddish purple; 4, Yellow or golden; 5, White or silvery; and these may be combined in a variety of ways. Dark bluish green has a good effect when placed in contrast with light yellowish green; white with dark green; reddish purple with light green; reddish purple with yellow; yellow with dark green. And these contrasts by no means exhaust our resources. I merely quote them from among a number of experiments which I have actually tried and found agreeable to my taste. I have, indeed, no intention here of laying down any precise or definite rules for the application of these principles; I aim at no more than to show that the materials in colour exist, leaving their combination to be dealt with by the ingenuity and industry of a cultivated taste. It would be chimerical to suppose, unfair to expect, that any person taking this subject in hand without previous study, or without the fullest acquaintance with the materials which exist—some of them newly introduced—would at once realise any great measure of success. To such an individual the scheme would probably appear utopian. He might, by a momentary effort, call up in his mind the short list of old and familiar trees with purple, white, and yellow leaves,—the purple Beech, the white Poplar, the variegated Turkey Oak, and some few others still among the most valuable, but so few in number that he would dismiss the subject as impracticable. But unless familiar with the black and yellow Oaks, the yellow Elm, Acacia, and Alder, the white-leaved Acer Negundo, and the many beautiful Maples recently introduced from Japan—the host of richly variegated trees only now becoming plentiful,—in a word, unless familiarly acquainted with the latest introductions of this kind, he would, I submit, be drawing his conclusions from incomplete information.

In order to bring my views to a practical test, I have here a diagram,

in which I have merely sought to obtain the identical colours existing among trees and shrubs, and must refer you to the specimens exhibited to show that these colours really exist. This diagram, hastily executed, will perhaps also give some idea of the effect of the arrangement of the colours which we possess. The light green here is supposed to represent the Larch, the dark green the Yew, the reddish purple the purple Beech, the yellow the golden Oak, and the white variegated Acer Negundo. There is also introduced here the ordinary green of Nature, which may fairly be taken as the groundwork of our operations.

Now, I am well aware, and would not ignore the fact, that the colours of the leaves of trees are influenced in some degree by cultivation and soil, but this does not affect our argument, as in the majority of cases they still bear the same relation to each other.

I have now to offer a few general remarks, with brief examples in support of the views which I have advanced. Let us remember that we are working with pictorial trees for pictorial effect. We may have spring pictures, summer pictures, autumn pictures, and permanent pictures. Summer and permanent pictures are the most valuable because of their greater durability. Specimens of these are before you, and a list of their names will be given at the end of this paper. The materials for spring and autumn pictures can only be shown in spring and autumn. The varying tints of the unfolding leaves of some trees in spring, and the glowing colours of the leaves of other trees in autumn, must be familiar to all observers, and these trees are beautiful in their seasons, whether regarded individually or in combination. But they are transitory. The varied and telling colours of spring, ordinarily, quickly subside into the universal green; and the bright leaves of autumn fall speedily before the frost and gales of that season. Yet both are desirable. The warm red and yellow tints of the unfolding leaves are peculiarly cheering in the cold days of early spring, and should be introduced freely when planting. The splendour of the American forests in autumn is a theme on which many travellers have loved to dwell, and leaves from these forests may be seen in that admirable institution, the South Kensington Museum. The trees we have long had under cultivation, and they are not only available but capable of being wrought up with magnificent effect in this country. Among the most effective of spring trees the Corstorphine Plane (*Acer Pseudo-Platanus flavo-variegatum*), yellow; the *Acer colehiem rubrum* (red); the purple Horse Chestnut (*Æsculus Hippocastanum purpureum*), purple; and the Silver Poplar (*Populus argentea*), white, may be instanced. The shades of green at this season are also innumerable, although for the most part gradually subsiding into one nearly uniform tint. The brightest among the leaves of autumn are, perhaps, the Scarlet Oak (*Quercus coccinea*), the Liquidambar (*L. styraciflua*), the Stag's-horn Samach (*Rhus typhina*), the *Ostrya virginica*, and several varieties of Cherries, Pears, and Maples; these usually die-off bright red. Of yellow shades may be instanced the Lombardy and Ontario Poplars (*P. fastigiata* and *P. canadensis*), the Norway Maple (*Acer platanoides*), the Horse Chestnut (*Æ. Hippocastanum*), the *Salisburia adiantifolia*, the Lime (*Tilia europæa*), the Tulip Tree (*Liriodendron tulipifera*), the White Mulberry (*Morus alba*), the *Gleditsia tricanthos*, the *Magnolia tripetala*, the *Juglans ansara*, the *Acer Negundo*, the *Kolreuteria paniculata*, the Birch (*Betula alba*), and certain varieties of Cherries, Pears, Thorns, and Maples.

As examples of planting for pictorial effect, nothing can be more beautiful in the flower garden than pillars or columns of Ivy, provided that they be appropriately placed. Here we have dark green, light green, green blotched with gold, and green edged with silver, all calculated to form permanent pictures. Standard and pyramidal golden Yews and golden Hollies also form beautiful permanent pictures in the garden. All permanent pictures are of course also winter pictures, but the common Beech (*Fagus sylvatica*) deserves special notice; it holds its reddish brown leaves throughout the winter, and this colour stands in warm and beautiful contrast with the Pines and other evergreens at that season. The white bark of the Birch, the white, purple, and yellow bark of certain species of Willows, the red and yellow berries of the Holly, and the yellow and black berries of the Privet, are also invaluable for winter decoration. I have often admired the effect of three large trees placed in juxtaposition in a garden in my neighbourhood, whether by accident or design I have no means of ascertaining. Near the bend of a river is a Weeping Willow, the pale green drooping branches appearing in the distance almost to sweep over the stream. Behind rises a mass of the dark feathery Yew, the plumes of foliage waving in beautiful contrast of motion, form, and colour. Still farther behind there appear in spring rigid masses of Apple blossom, the snow-white crimson-tinted flowers blending in beautiful contrast with the dark and pale green of the Yew and Willow. Here we have the evergreen and deciduous forms in combination, but they are most effective as a spring or summer picture. Of all the errors to be avoided in the association of colours, I would caution the planter against an arrangement that should present a "spotty" appearance. Broken lines, or irregular shapes of colour, appear to me more desirable in forming plantations or belts than figures with a more easily definable outline. On the face of belts or woods, three or five plants of a kind may be planted in a group, the outline being so broken that there are bays or promontories. In parks and gardens, single trees or groups of trees, each group of a distinct colour or shade of colour, would seem most appropriate. In working out these ideas we must never lose sight of harmony, remembering,

however, that there are harmonies of contrast as well as of analogy. There is another point which should on no account be lost sight of. There are some trees the effect of which is beautiful close to the eye, but which lose their distinctive character in the distance. Such are more appropriate to the garden, where brought in close contact with the eye, than in the distant landscape. But there are others which lose little or nothing from a distant view, and these facts must be taken into account and acted on when planting. As a rule, trees with variegated leaves are best placed near to the eye, and those of one uniform tint are most effective in the distance. I have already instituted a comparison between the colours of flowers and the colours of leaves, but there is an important difference in them, which I must not omit to mention. The colours of flowers are often so bright and pronounced, that certain of them cannot be judiciously brought into close contact; they require an intervening mass or line of some intermediate or neutral colour to render the effect agreeable and satisfactory. Not so, however, with the colours of trees: they are so subdued in tone that the association of the strongest colours does not produce violent contrasts. Again, for this very reason the colours of leaves being less bright than those of flowers, it becomes necessary here to accomplish by breadth of colour that which, with flowers, is effected by brilliancy of tone. Thus it follows that great breadths of scenery may be dealt with most effectively. It is, indeed, a mere question of outlay, and nothing more, whether variety of colour shall or shall not be extended from the garden to the outer pleasure ground and shrubberies, the hills of plantations, the outskirts of woods and forests, and the most distant mountains and plains.

A.—SUMMER PICTURES.

1. Light Green.

<i>Larix europæa</i> .	<i>Tilia europæa</i> .
<i>Taxodium distichum</i> .	<i>Catalpa bignoniifolia</i> .
<i>Gleditsia triacanthos</i> .	<i>Cobanea Fendleri</i> .
<i>Juglans laciniata</i> .	<i>Platanus occidentalis</i> .
<i>Acer Negundo</i> .	

2. Dark Green.

<i>Fraxinus crispata</i> .	<i>Æsculus Hippocastanum</i> .
<i>Pinus montophylla</i> .	<i>Euonia nigra</i> .
<i>Alnus glutinosa</i> .	<i>Fagus sylvatica</i> .
<i>Cytisus Laburnum</i> .	<i>Ulmus, various kinds</i> .
<i>Pyrus Aucuparia</i> .	<i>Quercus Cerris</i> .

3. Reddish Purple.

<i>Fagus sylvatica purpurea</i> .	<i>Corylus Avellana purpurea</i> .
<i>Ulmus campestris fol. purp.</i>	<i>Quercus pedunculata purpurea</i> .
<i>Acer Pseudo-Platanus fol. purp.</i>	<i>Quercus nigra</i> .
<i>Acer japonicum atropurpureum</i> .	<i>Berberis vulgaris fol. purp.</i>

4. Yellow or Golden.

<i>Quercus Cerris variegata</i> .	<i>Sambucus nigra aureo-variegata</i> .
<i>Robin var. Concordia</i>	<i>Symphoricarpos vulg. fol. aureis</i> .
<i>Fraxinus aucubifolia</i>	<i>Spiræa opulifolia lutea</i> .
<i>Castanea vesca variegata</i> .	<i>Robinia Pseudo-Acacia aurea</i> .

5. White or Silvery.

<i>Populus argentea</i> .	<i>Pyrus salicifolia</i> .
<i>Acer Negundo variegatum</i> .	<i>Salix argentea</i> .
<i>Tilia argentea</i> .	<i>Shepherdia argentea</i> .
<i>Pyrus vestita</i> .	<i>Siphocampylus rhamnoides</i> .

B.—PERMANENT PICTURES.

1. Light Green.

<i>Pinus pyrenaica</i> .	<i>Ilex hibernica</i> .
<i>Cedrus Deodara</i> (the green variety).	<i>Juniperus thurifera</i> .
<i>Abies orientalis</i>	" <i>virginiana</i> .
" <i>rubra</i> .	" <i>chinensis</i> .

2. Dark Green.

<i>Pinus insignis</i> .	<i>Quercus Ilex</i> .
" <i>austriaca</i> .	<i>Cerasus lanistatica</i> .
<i>Picea Nordmanniana</i> .	<i>Phillyrea</i> .
<i>Araucaria imbricata</i> .	<i>Garrya elliptica</i> .
<i>Cupressus Lambertiana</i> .	<i>Hollies and Yews, various</i> .

3. Purple.

There are no suitable purple evergreens, consequently this colour is restricted to summer pictures.

4. Yellow or Golden.

<i>Abies excelsa fineolensis</i> .	<i>Thuja elegantissima</i> .
<i>Cupressus thyoides variegata</i> .	<i>Taxus baccata aurea</i> .
<i>Ilex Aquifolium aurea</i> .	<i>Enonymus japonica flavescens</i> .
<i>Thuja aurea</i> .	<i>Retinospora pisifera aurea</i> .

5. White or Silvery.

<i>Cedrus Deodara</i> (the glaucous variety)	<i>Abies alba glauca</i> .
<i>Pinus excelsa</i> .	<i>Ilex Aquifolium argentea</i> .
" <i>monticola</i> .	<i>Juniperus virginiana glauca</i> .
" <i>nivea</i> .	<i>Rhamnus Alaternus fol. argenteis</i>

—W. PAUL, Paul's Nurseries, Waltham Cross.

Mr. Barron, of Barrowash, remarked that all delight to see a pictorial landscape if the picture is a pleasing one, but unfortunately this had not been so prominently brought forward in practice as it should be. If we considered the varied acquisitions which had come into our possession through recent introductions, every pigment necessary to form the finest landscape would be found. We had within reach a great variety of trees both for pictorial effect and for profit, and he was glad to see that arboriculture had engaged special attention. It was a subject that should occupy the attention of all.

Mr. D. T. Fish complained that the ruin of our landscapes had

been the mixed system of planting, sufficient attention not having been paid to distinctness of colour. He did not advocate the introduction of so much green into our gardens.

JUDGING FRUITS.

Dr. Hogg, after a few preliminary observations, said—

Though the judging of fruit has on various occasions occupied the attention of those interested in the subject, and has from time to time been discussed in the public prints by those most competent to deal with it, I am not aware that any common understanding as to the bases on which fruit-judging should rest has yet been arrived at. Notwithstanding this want of a written law on the subject, the practice of judging fruit is followed with results which, though not always agreeable to unsuccessful competitors, are, upon the whole, generally accepted and acceptable.

It is not my intention to submit anything to this meeting which can be regarded in any light as a solution of the question, Upon what principles ought fruit to be judged? This I will leave to be dealt with by those of my audience who are sufficiently versed in the subject, and who feel themselves competent to do so. All that I shall do is to state the motives which actuate me in coming to the conclusion I do when I am acting the part of a fruit judge, leaving others to set up any other code they may think better and more in accordance with their own views.

And first, let me remark that, in judging fruit at exhibitions, I think we ought to do so upon different grounds to what we would judge it at our own tables. We must bear in mind that exhibition fruit is exceptional, and is produced by the greatest effort of the horticultural skill of the exhibitor. It generally receives an amount of attention which he cannot afford to bestow on a general crop, provided his establishment is an extensive one; and we ought, therefore, to regard the exhibition fruit of a gardening establishment very much as we would the exhibition ox—as the exceptional animal on the farm. In judging fruit, therefore, we must first look to those points which exhibit the greatest amount of horticultural skill, and the first of these are size and symmetry.

In judging size and symmetry we must deal with each variety on its own merits. It would not be fair, for instance, to judge on the same grounds a bunch of Buckland Sweetwater Grape and one of White Muscat of Alexandria. That of Buckland Sweetwater may be much larger than, and equally as handsome as, that of Muscat of Alexandria, and both may be in every point what gardeners call "well finished;" but the skill required in producing such a bunch of Muscat of Alexandria being much greater than what is required to grow the Buckland Sweetwater, and the Muscat of Alexandria being a much superior fruit, I would give the preference to the latter, although inferior in size to the former. The same may be said of Black Hamburgh and Black Prince shown in the same class, though not on the ground that Black Hamburgh requires greater skill in the production of it, but because it is a superior fruit.

It matters not what description of fruit we may be judging; be it Grapes, Pines, Peaches, or any other fruit, size and symmetry are the features which first attract our attention, and therefore to size and symmetry, but not to size apart from symmetry, I attach, perhaps, the greatest importance when other points are not greatly deficient.

The next important feature is colour, requiring much skill in the development of it. This is by some regarded as of even greater importance than size and symmetry. I am rather inclined to give colour second place, except when it is unusually fine, and the difference of size and symmetry between the competing fruit is not great. In such a case I would certainly give the preference to colour, for I conceive that in such circumstances there is a greater exhibition of horticultural skill in producing the highly-coloured fruit than in producing the larger, because it betokens attention to the maintenance of the just equilibrium between the action of the roots and that of the leaves, and a knowledge as to the crop the plant is capable of producing, without which I conceive no fruit can be well and perfectly coloured. One may feed and force a plant so as to induce it to produce large and showy fruit, but unless the treatment is so regulated as to preserve the just equilibrium between the root which serves as the mouth and the leaves which perform the functions of digestive organs, there is no guarantee either for high colour or perfect flavour, which generally go together. Still I say when fruit has not an objectionably bad colour, and is not deficient in flavour, but has size and symmetry much in advance of another which possesses higher colour and better flavour, but is much inferior in size and symmetry, I would certainly give the award in favour of the larger fruit.

The next point on which I have to touch is flavour; and here I know there is a great diversity of opinion. Some hold that the beginning and the end of all fruit culture is flavour; no matter how large or how small, or however badly coloured the fruit may be, if flavour is obtained the grower has got all he has ever striven for. Now that is very well when fruit is grown merely for private use; and so long as the palate is satisfied there is no other desire to be gratified; but we are now discussing the merits of exhibition fruit, into which the whole energy of the cultivator is thrown to develop, not one, but every feature of his production, and the greatest display of cultural skill is to succeed in gratifying the mind as much through the eye as through the palate. It is not to be supposed that I depreciate flavour. On the contrary, I consider it an important point in making awards to

exhibition fruit; but I think it ought only to come in when the competition is otherwise so close that another point is required to turn the scale.

There is only one exception I would make on the question of flavour, and that is in judging Melons, which, if they have not flavour, have nothing whatever to recommend them. They may be Vegetable Marrows, or Pumpkins, or any other vegetable production, if flavour is absent; and I think experience will testify that if the flavour of a Melon is even but indifferent, then the fruit is not worth eating, and hence I think all Melons ought to be cut, and judged by flavour only.

In the report of the Rev. S. Reynolds Hole's paper on the Rose, at page 65, he is made to say, "The best stock for the Rose was the Manetti." His remarks were these:—"What is the best stock for the Rose? If you purpose to exhibit, grow it upon the Eriar, and show it the year after budding. If you desire a beautiful Rose garden, and do not care to exhibit, grow a large proportion of your Rose trees on their own roots. These are prettier, because more natural in form, more abundant in flowers, more enduring, and therefore more economical. Some Roses attain their full perfection on the Manetti stock, and all do well on it in our lighter soils."

ROYAL HORTICULTURAL SOCIETY.

AUGUST 3RD.

It was probably owing to the great heat which has prevailed for the last month that the subjects for which prizes were offered on this occasion were but poorly represented, both in respect to number, and as regards the variegated Pelargoniums, for the most part, in quality also. The flowering specimens of the Nosegay and double-flowered varieties were on the whole much better, although some of the former had suffered greatly from the heat. The subjects brought before the Floral Committee constituted the great attraction of the day, and the Council room, where they were exhibited, presented an unusually gay appearance for the end of the London season.

In Class 1, for the best Golden-variegated Zonal (Tricolor) Pelargonium, Messrs. E. G. Henderson & Son were first with the Rev. E. R. Benyon, the plants very well grown and finely coloured. The second prize went to Mr. Mann, Brentwood, for Gold Crown with a dark zone flushed with bright rose. The third prize was taken by Mr. Stevens with small plants of Kaling Royal.

Class 2 was for one Silver-variegated Zonal (Tricolor) Pelargonium. The first prize went to Messrs. E. G. Henderson & Son for well-grown plants of Lass o' Gowrie; the second to Mr. Turner, for Mrs. Ramsby; and the third to Mr. C. Edmonds, Hayes Nursery, for Hayes Royal. Mr. Mann exhibited Leader; Mr. Turner Miss Pond and Princess of Wales.

In Class 3, one Gold and Bronze (Bicolor) Zonal, Messrs. Downie, Laird, & Laing were first with Imperatrice Eugénie, one of their highly-coloured kinds. Mr. Cannell, of Woolwich, was second with Annie Keeler.

In Class 5, one Silver edged Pelargonium, Mr. Turner, who was the only exhibitor, was first with May Queen; and in Class 6, one Ivy-leaved Pelargonium, Mr. Turner was also first with Compactum, a neat-growing white variegated kind.

Class 7 was for one Nosegay Pelargonium in flower. The first prize was taken by Mr. G. Smith, Tollington Nursery, with Mr. Gladstone. Mr. Cannell was second with Master Christine, awarded a first-class certificate on June 8th, the plants being the same as those exhibited on that occasion, and still in good bloom. No third prize was given.

In Class 8, for one Zonal Pelargonium in flower, Mr. Mann was first with Lord Derby, and Mr. George, gardener to Miss Nicholson, second with Annihilator. The best double-flowered Pelargoniums shown in Class 9 were Marie Lemoine from Messrs. Downie & Co., and Madame Lemoine from Mr. Mann. These were good specimens.

FRUIT COMMITTEE.—G. F. Wilson, Esq., F.R.S., in the chair. Prizes were offered at this meeting for the best dish of early Plums. Mr. Douglas, of Loxford Hall, Uford, sent Early Green Gage; Mr. Beasley, of Ecton Hall, sent Early Orleans; Mr. Roberts, of Holwood, Beckenham, sent Early Prolific; Mr. Gilbert, of Burghley, sent Early Violet, and Myrobalan; and Mr. Porter, Syon Lodge, Isleworth, sent Early Morocco, and Early Orleans. Mr. Douglas was awarded the first prize; and the second fell to Mr. Porter. Dishes of McLaughlin, a large form of Green Gage, Woolston Black Gage, and Perdrigon Violet Hâtif, were sent from the Society's garden at Chiswick, all of which elicited the approval of the Committee. Mr. Gilbert, of the gardens, Burghley, sent a dish of Brown Turkey, remarkably well grown, but deficient in flavour. Mr. Gilbert also sent fine fruit of Noblesse Peach, which was of excellent flavour, and of Moorpark Apricot, also highly flavoured.

Mr. Dodds, gardener to Sir G. Smyth, Ashton Court, Bristol, sent a seedling Nectarine, which is said to be fourteen days later than Elrnge. The Committee were of opinion that the fruit bore a strong resemblance to Violette Hâtif; but in the absence of a knowledge of the flowers and leaves, the identity could not be settled. Mr. J. McLaren, of Ash, Surrey, sent a dish of fruit of his Prolific Raspberry, which received a first-class certificate last year, and which was this year commended on account of its flavour. Mr. Stowe, of Farnborough, sent

branches of Black Naples Currants, laden with fruit, and a dish of the bunches. The Committee awarded a special certificate for superior cultivation.

Mr. A. Henderson, of Thoresby Gardens, Notts, sent a Melon called Calder's Hybrid Notted Green-flesh, which was a large handsome fruit, but deficient in flavour. Mr. Meakes, gardener to R. Fowler, Esq., Petersham, Surrey, sent two fruit of Golden Perfection, of good, but not superior flavour. Mr. Sidney Ford, of the gardens, Leonardslée, Horsham, sent a fruit of Golden Perfection Melon, excellent in flavour.

Messrs. Minier, Nash, & Nash, seedsmen of the Strand, sent two dishes of the large Late White Tripoli Onion, and also of the large Red Italian Tripoli, all of which were grown in this country. The exhibition was so meritorious that a special certificate was awarded to them. Messrs. J. Carter & Co., of Holborn, sent samples of their Covent Garden Garnishing Parsley, with a splendidly curled leaf. This was much admired, and received a first-class certificate. Messrs. Carter also exhibited a long green-striped Cluster Vegetable Marrow. The habit of the plant is that of a bush, like that of the Bush Custard Marrow, and produces one fruit in the axil of the branches just over the stock. Mr. Gilbert, of the gardens, Buryhill, sent samples of the following Potatoes, remarkably well grown—Coldstream Early, Myatt's Prolific, Early Shaw, Milky White, King of Potatoes, and Silver Skin. Mr. Eckford, of Coleshill Gardens, sent samples of Potatoes to show that superabundance is the result of dry weather. Mr. Porter, gardener to E. Benham, Esq., Syon Lodge, Isleworth, sent a tray of vegetables. The same gentleman also sent a collection of five sorts of Potatoes.

Messrs. Lane & Son, of Berkhamstead, exhibited a collection of fruit grown in pots, to which a special certificate was awarded.

FLORAL COMMITTEE.—Mr. J. Fraser in the chair. From Messrs. E. G. Henderson & Son, St. John's Wood, came a basketful of Tricolor Pelargonium Rev. E. R. Benyon, a free-growing variety with finely coloured dark crimson zones flamed with bright crimson; Hydrangea japonica speciosa, with the leaves having a creamy white patch extending from near the apex to the leafstalk, and in the specimen shown from 1 to 1½ inch wide; the flower-heads have a bluish tinge. This is a very ornamental plant, and its merit was marked by a first-class certificate. The same firm also sent *Phlox densata elegans argentea*, with the leaves largely variegated with pale yellow, an ornamental variegated plant which may prove useful in borders; and a group of dwarf Antirrhinum from 6 to 9 inches high, and of different varieties. These received a special certificate.

From Messrs. Veitch & Sons came a large and fine group of plants, consisting of various elegant Palms, a handsome specimen of *Croton Veitchii*, *Dracena Cheloni* with leaves very beautifully coloured, *D. Gouffroyi*, *Oncidium*, *Cypripedium Veitchii* with seven fine flowers, *Croton maximum* and *Croton undulatum*, the latter with its dark-coloured leaves richly spotted and blotched with crimson and rose; *Zamia Lehmanni*, a very handsome specimen—for this a special certificate was awarded; *Maranta chinboracensis* and *Wallisii*; and a *Sciadophyllum* from New Caledonia, with large shining leaves with obovate leaflets. Besides these, *Pendrobium Bensonii*, *Cattleya Acklandia*, and *Saccolabium Blumei majus* were each represented by good specimens; and a special certificate was given to *Renaubera Lowii*, which is rarely seen flowering on so dwarf a specimen, but which had, nevertheless, a fine spike of its rich-coloured red and yellow flowers. A first-class certificate was given to *Bowenia spectabilis*, a Cycad with very handsome, shining, clear dark-green foliage. A special certificate was given Messrs. Veitch for the whole collection.

Mr. Bull sent *Croton maculatum*, with the leaves irregularly marked with rich pale yellow, which was in a much larger patch on the young leaves; several Palms; *Cycas Broughtoni*, a handsome species; *Syngonium Seemannii*, with dark green foliage beautifully variegated with silvery markings along the midribs and principal veins of the leaves; *Adiantum Seemannii*, *Dicffenbachia Wallisii*, *Macrozamia magnifica*, and *Lilium auratum Brilliant*, finely dotted with purple. First-class certificates were awarded to *Cycas Broughtoni* and *Macrozamia magnifica*.

Mr. J. Stevens, 4, Ealing Terrace, Ealing, contributed a splendid collection of Balsams, beautifully grown, and with flowers which for size were more like small Camellias than Balsams. The colours were chiefly scarlet and flesh, the mottled kinds were also very fine. For these a well-deserved special certificate was awarded. Mr. Windsor, gardener to J. R. Havenhill, Esq., Leytonstone, sent a number of hybrid Nosegay Pelargoniums of various shades of scarlet, and all producing large trusses; and Mr. George sent a similar collection, including several varieties with fine trusses.

From Mr. William Thompson, of Ipswich, came *Eriothera* or *Godetia Whitneyi*, a hardy Californian annual with flowers 2½ inches across, lilac rose, with a red blotch in each petal, the plant apparently of compact habit. For this a first-class certificate was given. Mr. Ford, Leonardslée, Horsham, sent Lady of the Lake white-edged Pelargonium, with a broad white edge, and Golden Pink, a yellow-edged kind.

Messrs. Carter & Co. received a special certificate for three baskets of cut blooms of double-flowered Pelargoniums neatly set up. Mr. Cunnell, Woolwich, sent cut trusses of various Zonal Pelargoniums.

From G. F. Wilson, Esq., Weybridge Heath, came a pot of *Lilium speciosum atropurpureum*, a beautiful deep-coloured variety, and which will soon be covered with a profusion of bloom. The same gentleman

also sent a cut flower-stem of *Lilium tigrinum flore-pleno*, a very fine variety of Tiger Lily with four rows of petals, also *Lilium Leitchii* with spotted pale yellow flowers. Mr. Turner, of Slough, exhibited an extremely beautiful variety of *Lilium auratum* dotted with deep purple, and the same colour shading into the golden bands. For this lovely variety a first-class certificate was given. Messrs. Downie, Laird, and Laing contributed a collection of *Phloxes* in very fine bloom, La Candeur, Mr. Charles Turner, and *Geant des Batailles* being especially remarkable. Messrs. Downie & Co. also sent *Monsieur Guldenschych*, salmon rose with a purple eye.

Messrs. Barron & Son, of Elvaston Nurseries, exhibited scarlet Zonal Pelargonium *Magnificum*, a large-trussed and large-flowered variety, which, from the abundance of buds, appears to be a variety that will flower in long succession. Messrs. Cutbush & Son, of Highgate, received a special certificate for excellently grown Cockcombs. Messrs. Standish & Co. sent a fine stand of Gladioli, and Messrs. Carter & Co. had a special certificate for a large collection of the same flower. A special certificate was awarded to Mr. Stevens, Reigate, for two pots of *Disa grandiflora*, which were very fine specimens of culture. Mr. Green, gardener to W. Wilson Saunders, Esq., sent *Agave auricantha*, a handsome plant; a new *Orchid* from Natal, with the small lanceolate leaves barred across with black spots, and the bracts of the lilac flowers similarly marked; and *Achimenes arzyrostrigma*, with very small white flowers. Mr. G. Thomson, Stanstead Park Gardens, Emsworth, was awarded a first-class certificate for a seedling *Lilium*, a hybrid between *L. auratum* and *L. speciosum*; the flowers bear most resemblance to those of *speciosum* in form, and are white without golden bands, and spotted with purple. This was named *Purity*, and received a first-class certificate, which it well deserved, being very beautiful.

Mr. Cattell, Westerbam, again exhibited *Tropaeolum Minnie Warren*, and Mr. Cripps, Tuubridge Wells, two stands of cut blooms of his fine *Clematis Crippsii*, from the open air. Mr. C. J. Perry, Castle Bromwich, was awarded a special certificate for a stand of seedling *Verbenas*. From the Society's Gardens at Chiswick came six seedling fringed *Petunias* and *Pteris serrulata major cristata*, a handsome crested form, which received a first-class certificate. Mr. W. Dodds, gardener to Sir G. Smyth, Bower Ashton, Bristol, sent *Heliotrope Miss Dodds*, which is stated to be a very free bloomer and of good habit, but neither that nor seedling *Pelargonium Miss Upton*, a free-blooming pink kind, was in proper condition to judge of. Messrs. Carter & Co. contributed cut flowers of *Sunflowers*, very large and perfectly double. Mr. Porter, gardener to E. Benham, Esq., Isleworth, exhibited cut flowers of seedling *Tropaeolums*, *Pentstemons*, *Zinnias*, and *Hollyhocks*.

A first-class certificate was given to G. F. Wilson, Esq., for his double Tiger Lily above noticed, and second-class certificates to Mr. Keynes for *Dahlia Incomparable* and *Flora Hyatt*. Special certificates were awarded to Messrs. Downie & Co., for *Phloxes*; to Messrs. Carter & Co. for a fine collection of *Gladioli*; and to Mr. C. J. Perry, of Castle Bromwich, for seedling *Verbenas*.

GENERAL MEETING.—G. F. Wilson, Esq., F.R.S., in the chair. After the usual preliminary business the Rev. M. J. Berkeley commented on the most remarkable plants exhibited. The first which occupied attention was *Renaubera Lowii*, shown by Messrs. Veitch under the name of *Vanda Lowii*, which was that given it by Dr. Lindley, and Mr. Berkeley read the following account of the plant given by Mr. Bateman in the "Botanical Magazine" for 1854:—

"A more remarkable plant is not to be found among the vast and varied tribe to which it belongs. While in stateliness of habit and in the length of its flower-spikes it stands quite unrivalled among the *Orchids* of the Eastern world, its greatest peculiarity is to be found in the constant occurrence of two entirely distinct forms of flower on the same spike. This extraordinary circumstance was first observed by Professor Reichenbach, who satisfied himself, after a careful examination of fresh specimens furnished from M. Reichenheim's garden, that the strange phenomena had nothing to do with the separate production of male or female blossoms, since the organs in either form were equally perfect. In the present case nothing can be set down to caprice, for that singular pair of tawny flowers is found at the base of every spike.

"This wonderful *Orchid* is a native of Borneo, whence it was originally sent to the late Mr. Low, of the Clapton Nursery, by his son (Colonial Treasurer at Labuan), in whose honour the species was named by Dr. Lindley. It has also been imported by Messrs. Veitch, in whose nursery, at Chelsea, I first had the pleasure of seeing the plant in bloom. It was not, however, until the autumn of the year 1862, when the species flowered in Mr. Rucker's collection, that any adequate idea could be formed of its beauty. A full account was published in the *Gardener's Chronicle* at that time, which would apply equally to Mr. Rucker's plant, as it might have been seen in September last, when it again burst into flower, and, if possible, in greater beauty and profusion than before.

"I gather from a memorandum received from Mr. Pilcher, Mr. Rucker's gardener, that the Wandsworth plant is already 9 feet high, and that it produced six spikes, each bearing from forty to fifty flowers, which lasted in perfection for a month. The spikes attained to such an extraordinary length that they had to be supported on props, and thus formed graceful festoons, under which a person might walk! The plant requires the heat of the East Indian house, and grows so freely that it seems almost to chafe at the comparatively narrow scope which the low roofs of modern *Orchid-houses* afford it.

"Dr. Lindley, who had only seen the specimens originally sent from Borneo, referred our plant to *Vanda*; but Reichenbach, who more recently had the advantage of examining living flowers, is decidedly of opinion that it falls more properly under the genus *Renaubera*; and as in this case I

quite concur in the view of the German Professor, I have not hesitated to substitute the name of *Renanthera* for that of *Vanda Lowii*."

It was, remarked Mr. Berkeley, a singular fact that the two tawny flowers are strongly scented, while all the others are scentless. The *Godezia*, shown by Mr. Thompson, of Ipswich, the hybrid *Lilium Purity*, and the unnamed *Natal Orchid* from Mr. Wilson Saunders's garden, were next referred to in highly commendatory terms, and Mr. Berkeley pointed out that the bracts of the last-named are striated exactly like the leaves. Mr. Berkeley concluded by pointing out to the meeting a curious specimen from the garden of Mrs. Lloyd Wynne, of Coed Coch, in which the pigmy *Abies claustralis* was seen to be reverting to the common Spruce, thus affording a proof that the supposition that it was a sport of that tree is correct.

The next meeting, in conjunction with the *Gladiolus Show*, will be held on the 17th inst.

DIFFERENT ROSES ON THE SAME STOCK.

I HAVE SEVEN varieties all doing well on the same stock—viz., *Gloire de Dijon*, *Paul Ferras*, *Sir Joseph Paxton*, *Prince Imperial*, *Caroline de Sansal*, *Charles Lawson*, and *Madame Charles Crapelet*. These are all ludded on a Rose of the *Multiflora* family, white or blush, and are growing on a west wall in front of my cottage. Your readers will remember the coldness of the weather in April and May, 1869, yet I cut beautiful Roses from this tree on May 15th, and again on December 25th. All the varieties are thriving, and they had an admirable effect last June when the various coloured flowers were out together. I may add that I had on the same stock *Général Jacqueminot* and a *Perpetual Moss*, but accidents happened to them, and they were pulled off.—C., Ireland.

EDIBLE-FRUITED RIBES.

THE enclosed fruit, which is of American origin, I have not before observed. It is said to be a hybrid between a *Gooseberry* and some sort of *Currant*; when ripe it is a pleasant sub-acid fruit, is very good for cooking and preserving, and has the great merit of always bearing a heavy crop, even when *Currants* and *Gooseberries* fail in the garden in which it grows.—W. D. Fox.

[This is one of the many interesting species of *Ribes* found in North America, we think *Ribes oxycanthoides*, although we cannot determine exactly with the fruit only. The fruit, as stated, is not unlike a small *Gooseberry*, and not unpleasant to eat.—EDS.]

GLASS WALLS.

EVERY extension of the use of glass has marked an improvement in the science and practice of gardening. The more glass used in the roof or sides of a house the greater the yield, the richer the reward. Gardening lingered long under the shadows of semi-opaque roofs of inferior and dear glass. The emancipation of glass from fiscal burdens marked a new and much higher epoch in cultivation. Within the last thirty years horticulture has advanced more than in three hundred years previously. The chief reasons of this rapid progress are the cheapness and plentifulness of glass. The improvement in quality has kept pace with the increase in quantity, until now good glass, but a few years ago the luxury of the few, has become a necessity to the many. Neither have we reached the limits of its use. The plentifulness of glass has stimulated invention. We are not using enormous quantities of glass for old purposes, but almost daily applying it to new uses. We are roofing our houses and draining our land with glass tiles; applying portable glass to wood and earthenware for the formation of miniature hothouses on the ground or the surface of our walls; covering the faces of these walls with glass screens, moveable or otherwise; and last, but by no means least, building the walls themselves with glass. This promises most important issues for horticulture, and will be a substantial boon to every one who grows fruit or flowers against walls.

Bank any plant up against an ordinary wall, and you weaken it in two ways: You deprive it of motion, and you rob it of light. The last is by far the more serious injury. Doubtless the vibration of plants in the open air is a strengthening process of more or less power, but the shutting-out of light is a much more serious and potent cause of weakness than the fixing of plants against walls, for light not only enables plants to assimilate their food, but to build it up into structure or produce; it at one and the same time transforms, extends, and consoli-

dates. By so much as you lessen the supply of light you weaken their assimilating and growing force. It therefore follows that plants on walls will as a rule be much weaker than those not on walls; and this weakness, born of semi-darkness, renders them liable to diseases, and exposes them to premature death. If, however, by any means plants against walls can be exposed to almost as much light as those in the open air, they will probably become nearly as robust and long-lived.

Now, by the use of glass for walls each side of the tree, and both sides of the wall, will be more or less fully exposed to the light. Transparent walls will banish the chilling coldness of northern aspects from our gardens. The sun, that hitherto wasted its strength upon dead bricks, will from henceforth be employed in the nourishment of living trees. Experiments have shown that the north side of glass walls is only a few degrees colder than the south side, and there will be but little difference in the intensity of the light upon the two sides. Were the glass perfectly transparent the difference in either light or heat on the two sides would hardly be perceptible; for though glass bends the rays of light or heat passing through it out of their straight course, it scarcely perceptibly hinders them. But the glass employed in the construction of these walls is rough plate weighing about 2 lbs. to the foot, and therefore not quite transparent: hence it arrests and retains a certain proportion of the heat, and radiates the remainder back into the air and down upon the ground. There may be some drawbacks incident to the very active radiation of glass walls. Probably they may cool at night faster than opaque walls, but this activity is not an unmixed evil. During hot weather the surface of glass will be cooler than any other wall. The heat that rebounds from this is not lost; much of it goes to warm the ground and the roots of the trees; and it seems probable that in practice it will be found the borders at the foot of glass walls will have a superior mean temperature to those at the bottom of any kind of opaque walls. This reserve of heat stored in the earth during the day, will be slowly given out at night to the protection of the trees on the walls.

The comparative coolness of glass walls during bright sunshine is also a great cultural advantage. Heterodoxical as it may appear, I am prepared to affirm that we lose more wall trees through an excess of heat than of cold. The sun scorches them on the surface of the bricks or stones with a dry heat of 100°, 120°, or 130°; they succumb, and then we mostly blame the preceding winter. The accumulated force of the sun and the bricks together in nine cases out of ten kills or ruins the trees that die suddenly or become the victims of fatal diseases. On glass walls, not only will the surface be cooler, but the trees perforce must be trained on a trellis from 2 to 3 inches from the glass. So placed, and with such an active radiation behind them, the trees will never be scorched. The advantages will also be wholly on the side of glass in the spring. Our great difficulty through February and March with such excitable subjects as *Peaches* and *Apricots* is to hold them back. While the flowers are within the buds they are safe; once they have come out, they are in danger. The absorptive powers of the brick wall hurry them forth into the cold biting weather. A hot day or two come, and the blazing sun, accumulating its whole force upon the surface of the wall, makes all the buds spring open; and then frost comes and feasts upon their tender beauty, to the wreck and ruin of our fruit prospects. Glass will act to keep the flowers within their scaly sheaths, where they are well-nigh invulnerable.

And then, consider for a moment the cleanliness, the elegance, and the beauty of glass walls. They hardly afford a hiding place for a thrips; they seem mirrors for the trees to admire themselves in; and their beauty, with the sunbeams leaping out and in, and bending down in all directions among the branches, is a sight that must be seen to be appreciated. Nothing could well be more uninteresting, if not positively ugly, than our opaque walls, and few things more neat and ornamental than glass walls; but they have also utilitarian merits of the highest order. Is space valuable in most gardens? It is. Glass walls will save about 8 inches out of every 9 occupied by brick or other opaque walls. Their strong framework of iron, felt packing, and slabs of glass, with or without a slate base, only occupies about 1 inch of space. They are easily erected, quickly removed, and conveniently portable. They can be had of any height and in any form, as straight, zigzag, square, &c. Being transparent, they may be placed closely together in blocks. By such arrangements an immense area of wall could be sheltered from spring frosts, and protected from birds, with the smallest possible quantity of canvas or netting.

But the thinness of these walls will not only save surface space, but also give up a large area of ground to the roots. No cumbersome and massive foundations will be needed for them to stand upon. The sharp dividing lines between north and south borders will be abolished. The roots of trees on both sides of the walls will turn to the warmth, and seek supplies of food from the most genial quarters.

Through the courtesy of the inventor and patentee, Mr. Charles Beard, of the Victoria Works, Bury St. Edmunds, I am enabled to give woodcuts of sections of his straight and zig-

zag glass walls. As will be seen, they have an iron coping to ward off rain and frost. They are offered complete at a considerably less cost than 9-inch brick walls. Their complete portability will render them invaluable to tenants, who are often prevented

from building walls for horticultural purposes by the unsatisfactory law of fixtures, which leaves us free to put property down almost anywhere, but hinders us from taking it up again. These walls may be covered with fruit trees or flowers to-day, and to-morrow be resolved into their original elements of a bundle of iron, a crate of glass, and a roll of felt on ship or rail, and carried to any part of the world. For forming boundaries between small gardens, screens between different parts of the same domain, barriers between kitchen and flower gardens, partitions in offices or even dwelling-houses—different forms of glass walls will prove most useful. Within the garden they provide shelter without shading, and for this reason they cannot fail to improve the health and increase the fruitfulness of most of our wall fruit trees.

In a word, the glass walls threaten to drive the north pole out of our gardens, which some have protested against, inasmuch as this cold region has been useful in steering our deserts through the arctic regions of winter. But my idea of this matter is, that we may gather as late Plums, Cherries, and Pears off standards in cold aspects, as we can from north walls, and that in our climate it is a sheer waste of money to build walls to increase the cold. By the use of glass walls we shall double the extent of our genial climate, and may grow superior fruits successfully on both sides. Late winter supplies we even gather as good, or better, off espaliers, pyramids, or common standards, as from the backs of north walls.—D. T. FISH, F.R.H.S.

AMONGST THE ROSES AT SOUTHWELL.

"HAVE YOU seen Merryweather's Roses?" This is a familiar and oft-repeated query, and has escaped the lips of hundreds during the past few weeks in the midland counties, where the stands of this young aspirant to Rose fame have been a great centre of attraction by their sterling excellence and the high

honours achieved. In every case this season, save one, that these Roses have entered the competitive lists they have carried off the first honours. The exception was Loughborough, where they ran second in the race in a field of veteran rosarians.

Mr. Merryweather has brightened many otherwise bright horticultural exhibitions where, in "all-England" lists, in the short space of three weeks, he has carried off in his quiet modest manner ten first prizes. It was on the evening of one of these exhibitions, under the hospitable paragonage roof of "C. C. E.," that a trio met in solemn conclave, discussed and decided all about Roses, and settled that the next meeting—of the majority—should be held at the home of the Roses at Southwell. The train duly set me down, and permitted a stay of twelve hours "among the Roses." I have seen many collections public and private, but have not seen those of Messrs. Rivers, and Paul, and Radclyffe; so set it down for what it is worth when I say that I never saw a finer, healthier, better-managed lot of Roses than in the little nursery at Southwell. It was a veritable feast of beauty. It is the result of an alliance of great power and unlimited resources—viz., natural position and cultural skill. The part of the nurseries set apart for Roses may be termed one of Nature's miniature hollows, and is sheltered by the gradual rising of the ground on the one hand, and by distant trees on the other. The soil is a fine, sound, good-hearted, alluvial loam, just the kind to build up a sound constitution for the Rose.

But Roses here do not grow themselves, but are tended in a very practical manner from their very infancy by Mr. Merryweather, jun., for be it understood he is not of the kid-glove-and-lavender-water school. No, his gloves are pruning gloves, and his "rose water" is far more relished by the roots of his Roses than by delicate noses. To these let me commend that exquisite Rose La France, which has a delicious scent and is truly a grand Rose. The most attractive of the new Roses was, undoubtedly, Marquise de Mortemar, with examples of blooms $4\frac{1}{2}$ inches across, of a satiny white colour deepening towards the centre. A useful feature in this fine Rose is, that it seems to inherit the robust nature and free-blooming habit of its parent, Jules Margottin. Another worthy son of a worthy sire is Henry Ledchoux, from Victor Verdier. Montplaisir is very promising, though its outliving its parent, Gloire de Dijon, is very problematical. Two other fine new Roses were Thérèse Levet and Victor le Bihan, the latter quite first-rate in every respect. Of the general collection there were strikingly fine examples of Abel Grand, good all over; Black Prince, looking as bold as his great prototype; Comtesse de Jaucourt and Madame la Baronne de Rothschild in their calm beauty of colour and superlative foliage; Duchesse de Caylus, Madame Victor Verdier, Le Rhone, Marie Baumann, Maurice Bernardin, and Xavier Olibo, all extra grand, with Horace Vernet, Marguerite de St. Amand, Princess Mary of Cambridge, and Edward Morreu simply magnificent. But I must close my note-book for fear the matter may be interesting only to myself, just chronicling the remarkable vigour of a batch of Maréchal Niel, and the mildew-resisting powers of that fine Rose, Madame Clémence Joigneaux; not a particle of the parasite can be found on this variety in any part of the nursery. The Noisette and Tea section is well represented, a larger number being in pots of a handy portable size.

Mr. Merryweather's secret—no, he has no secrets—his basis of success rests with the sound practical attention bestowed from the very moment of planting his Briars. His power lies in his mulching, a practice in general gardening which cannot be over-estimated. The Manetti as a stock is a great favourite here, and as managed is an unequivocal success. Out of a batch of several hundreds or thousands worked on this stock, budded close to or below the ground, hardly a sucker can be found, and all are growing in the perfection of vigour.

To those who know little or nothing of Roses I append a short list compiled with great care on the spot. It is a selection of generally useful varieties, free growers, and free bloomers, and such as may be planted with confidence to give a good display in the garden; many good kinds are left out, even fine ones; its merit is, that no bad "miffy" growers are kept in. If six only are wanted, take the first six; if twelve, the first twelve, and so on. It contains nothing unproved or expensive, and may be useful to some one. The names are—Alfred Colomb, Charles Lefebvre, Madame la Baronne de Rothschild, Maréchal Vaillant, Marguerite de St. Amand, Maréchal Niel, Docteur Andry, Duchesse de Caylus, John Hopper, Madame Victor Verdier, La France, Madame Willermoz (Tea), Black Prince, Duc de Rohan, Duke of Edinburgh,

Exposition de Brie, Madame Clémence Joigneaux, Horace Vernet, Marie Baumann, Princess Mary of Cambridge, Victor Verdier, Madame Margottin (Tea), Souvenir d'un Ami (Tea), and Souvenir d'Elise (Tea).

For an amateur making a start, the above are recommended as good-all-round Roses. They are selected on their merits, regardless of the names of the raisers or the time at which they were introduced.

Taking a glance at the other parts of the nursery, we find some acres of fruit and forest trees kept well in hand, also a large stock of evergreens, and Conifers good and well managed. The houses are useful span-roofed structures. One is planted almost entirely with Mrs. Pince's Black Muscat Grape, and is bearing fine bunches. There is a splendid stock of pot Vines, and a healthy stock of Azaleas and Camellias raised and grafted on the spot. The general aspect of the nursery is neat and well-kept, the edges being close and trim, and weeds banished. The whole place gives evidence of skill, enterprise, industry, and perseverance, and by a continued exercise of these qualities the present rapidly acquired position will soon be left behind, and Mr. Merryweather will speedily occupy the front rank as a rosarian, and take a highly creditable stand as a general provincial nurseryman. He is animated by the spirit of his good neighbour the Rev. S. Reynolds Hole, and will in time excel. By the way, my pleasant day closed with two disappointments. I went to see the Canon's Roses—they were out of bloom; and the king consort of the queen of flowers was "out of town."—J. W.

PELARGONIUM PRESIDENT REVEIL.

THIS *Pelargonium* is of great merit as a bedding plant. To fully realise its value it should be planted by the side of other dwarf kinds; very dwarf and compact in its habit of growth, its chief superiority lies in its great abundance of compact trusses of vivid scarlet flowers, borne on short stout stalks just clear of the foliage. For so dwarf a plant the size of its flowers is remarkable, they being almost as large and quite as well shaped as those of Lord Derby. Its great utility as a front-row plant for ribbon borders, for small beds, and, indeed, for any position where dwarf-growing plants are required, should render it a general favourite.

In one or two former papers I have included this *Pelargonium* in my list of select sorts, and after having grown it for three years, so highly do I esteem it that I consider it fully merits this special notice.—EDWARD LUCKHURST, *Egerton House Gardens, Kent.*

WORK FOR THE WEEK.

KITCHEN GARDEN.

THIS is the time for laying the foundation of a sure supply of vegetables and salads for the ensuing winter. I shall suppose that all the spring and midwinter *Broccolis* have been planted some time, and that *Turnips* for October and November have also been sown; it remains to insure a continuous succession of *Canliflowers* and autumn *Broccoli*, also a full supply of *Salads*. The Cape *Broccoli*, although apt to sport, are amongst the most useful for affording a sure supply, provided the family are resident at their country seat from October to Christmas. Where such is the case the last planting should be immediately accomplished, and that should be a good breadth. A rich border should also be highly prepared for *Canliflowers*; these, planted immediately, will supply the table until Christmas if kept secure from frost. *Endive*, also, must be planted out with a liberal hand, likewise autumn *Lettuces*. Let no piece of ground remain vacant, and let a clearance be made forthwith of all decaying crops, or those which are unprofitable, supplying their place immediately with crops such as those just mentioned.

FLOWER GARDEN.

NOW that the effect of the present arrangement of the colours in the beds can be fairly seen, there is an excellent opportunity for noticing any mistakes, and determining upon the arrangement for next season, and this should be done without delay. When it is decided what each bed is to be occupied with next season, a plan of the garden should be made, writing the names of the plants on the beds according to the arrangement decided upon. This will be of the greatest service in showing at any time what quantity of each kind of plant has to be propagated, and unless some method of this sort be adopted, it is not unusual to find at planting-out time that there is a scarcity

of some plants and a superabundance of others; whereas those who have their plan to refer to can tell at a glance the exact number of everything required, and avoid mistakes in propagating too many of one plant and too few of another, and all the anxiety and confusion of working without a well-defined object in view. Dahlias will require to be gone over frequently to keep their side branches securely tied-in, for when left untied they are readily broken off by a thunderstorm. Hollyhocks must also be securely tied to their stakes. Continue to remove dead flowers from Roses, and give plenty of manure water to the autumn-blooming varieties. Those who can find time may pick off the seed-pods from their *Rhododendrons*; this will add much to the strength of the blossom in the next year. The Azaleas, of course, will benefit by the same process. During showery weather plant out all rooted Pink pipings. Should very dry weather occur they must be shaded and carefully attended to. It is advisable to pot a few pairs of the best sorts, and place them in frames; though the Pink is much harder than the Carnation. By adopting this plan they may be safely removed at any time, will make more roots, and, consequently, are more likely to form strong plants and to bloom well. Prepare a bed for the Tulip offsets, which must be planted in a few weeks, for many of the smaller ones, if kept out of the ground till the usual planting time, will shrivel and perish. It will, therefore, be necessary that amateurs and those commencing the fancy should immediately secure offsets of expensive or scarce sorts, if blooming roots cannot be readily or reasonably obtained, as most growers have commenced arranging their collections. Continue the directions given for Carnations and *Picotees* last week, and carefully prevent the seed-pods from contracting damp. Early application should be made for new or favourite varieties, in order that they may be potted off as soon as they are well rooted. Seedling Auriculas that have hitherto been kept in pans or boxes may now be placed singly in small pots; the soil used may consist of equal parts of sound turfy loam and leaf mould.

GREENHOUSE AND CONSERVATORY.

NOW that there is a profusion of flowers out of doors, it will not be possible to maintain the interest of the conservatory except by keeping it furnished with handsome specimens of showing plants. Azaleas, which do not seem inclined to start freely into growth, should, if possible, be placed in a moist situation, and be afforded every possible attention to induce them to make vigorous growth. Specimens in heat which have their bloom buds well formed, should be removed to a cool house or a sheltered shady situation out of doors, but they must be protected from drenching rains. Young plants which it may be desirable to increase in size as much as possible should, if they are setting their bloom, be stopped regularly over and encouraged to make another growth. See that the whole stock, particularly of plants in heat, is free from black thrips, and spare no trouble to keep the plants clear of this pest. Camellias which have fairly formed their bloom buds should either be placed out of doors or in a cool dry house, keeping them rather dry at the roots, in order to prevent their making a second growth, which young vigorous plants are apt to do if kept in a close moist situation after they have formed their flower buds. Any of the plants which may require more pot room should be repotted at once, so that the roots may take hold of the fresh soil before the blooming season, for these seldom bloom finely unless the pots are moderately filled with roots. If there are sickly or badly rooted specimens of other plants here they must be frequently examined for red spider, or they may become a nursery for that pest, and it will soon spread to adjoining plants. See that the young stock is not allowed to suffer from want of pot room, and attend carefully to watering, giving weak liquid manure to all plants in free growth that are likely to be benefited by it. Stove plants which may have been removed to the conservatory while in bloom should be placed in heat again as soon as their beauty is over, in order to permit the young wood to ripen. Plants which require repotting should be kept in-doors after shifting until the roots are established in the fresh soil. Attend well to young stock, which will now be growing freely. Keep the shoots nicely regulated and shaped as may be necessary to secure well-formed specimens, and use every care to afford these a moist atmosphere, sprinkling them overhead early in the afternoons of bright days, and reducing the amount of air. Chrysanthemums should now receive their last shift. Endeavour to keep them stiff in habit and to preserve their lower leaves. Any necessary amount of strength may be imparted to them, when the flower buds are formed, by good liquid manure. For the

greenhouse, look well after winter-flowering plants of a rather commoner order, such as Cinerarias, Verbenas, Scarlet Pelargoniums, Heliotropes, Roses, &c. Cinerarias must now be potted off, whether from seed or suckers, also Chinese Primroses, remembering to give the last shift immediately to those intended to blossom in October and November. Scarlet Pelargoniums and Heliotropes, in order to bloom, must be pottedbound.

STOVE.

Successions of Brugmansias, Clerodendrons, Euphorbias, and Poinsettias should receive a last shift directly, in order to provide a rich autumn display in the conservatory. Climbers on ornamental trellises should be occasionally cut back, in order to have a succession later in the season when flowers become scarce. A quantity of such plants as Thunbergias, Ipomoeas, Pergularias, Jasminums, Stephanotis, and Passifloras, &c., should be trained up ornamental trellises without delay.—
W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

THOUGH there have been next to deluges at places not far distant, we have only had showers so soft as more to resemble dew than rain on several mornings; and this, along with cooler weather, has given everything a rest, if not some encouragement to growth. Nothing could so well show the advantage of a syringing overhead in hot weather, where it could be given, as these misty showery wrappings in the morning. The whole tops of the plants were so swelled out with the gentle bedewings that they stood the sun well. We feel sure that many plants would have been completely burned up but for the change in temperature, these drizzling dews, and shading and mulching. It was pleasing to note how even a mulching put on roughly assisted plants that could hold their own with great difficulty. Leaves that were prostrate one day held up their heads the next, and that when there was no more difference as respects the sun heat than there was between the 22nd and 23rd ultimo, and where no watering of any kind could be given. If the mulching was short and put on rather roughly it acted better than longer litter, though that, too, helped. Our theory for this is, that the shorter litter, though keeping the sun from so fiercely acting on the soil beneath, did not, like a surface-watering, arrest the rising of moisture from considerable depths, and then the closer texture of the shorter litter kept that rising vapour about the roots instead of permitting it freely to escape into the atmosphere. By such means, and the help of some sewage water from the 25th and onwards, until that, too, was exhausted, we feel that now we can breathe somewhat freely again, and hope that the worst of the season is past, as the longer and colder nights will give us refreshing dews.

This season ought to be a lesson to many. We know of some farms where several horses have been employed every day in drawing water in barrels for a distance of from three to four miles. Syringing or engineing any kind of wall trees has been with us quite out of the question.

We dug down a large quarter of three-year-old Strawberries, and found the ground so hard that neither spade nor fork was of any avail, but we had to use the pick to break it up, and then to turn it over with the spade when broken. This ground, though so hard, was not so dry as ground whence crops of vegetables had been taken. The tops of the Strawberries and the mulching given had prevented in this respect the free action of the weather, but we never recollect finding the ground so hard. We were half inclined to clear off the Strawberries, make holes with a crowbar, and plant in the firm soil, as thus thus frequently Broccoli and other vegetables do well; but then we thought of the wheeling involved in clearing off the large crowns of the Strawberry plants, and the manure that would also thus be lost, so we resolved on trenching all down. When well broken and levelled we rolled the ground well, and then drew drills, and planted Broccolis, Borecoles, and Brussels Sprouts in the usual way, first watering them well in beds, lifting and soaking them, and then watering after planting with a little sewage water. This will be our second main planting. The first is pretty well holding its way in defiance of the dryness, the watering of sewage in their case having been given to the roots and not over the ground. In such weather as we have lately passed through, all surface-watering was worse than useless, unless it was merely given for the purpose of refreshing the foliage, or given in such quantity and manner as thoroughly to reach the roots of the plants.

We would have used much more water than we could obtain,

but our observation and experience tell us that millions of gallons have been need in gardens to the injury rather than the benefit of the crops.

Sowed Lettuces, Radishes, Turnips, and a few Cauliflowers for early work, reserving our main sowing until the end of the month. By means of sewage, &c., we sowed in damp soil, and covered over with dry soil, for reasons several times given. Our Dwarf Kidney Beans have done well under this treatment with little or no watering. The Scarlet Runners have grown and bloomed very well, but they have not set so freely as we should have liked. Taken altogether, we suffered more from the heat and excessively bright sun of July 22nd than in all the days of the summer. On that day myriads of Scarlet Runner blossoms fell, as if there was nothing to support them. Now they seem all right with mulching, and we have no doubt will be benefited by sewage water if the warm weather continues.

We shall most likely sow a few rows of Spinach and Onions for the earliest winter crop by the time this is in print. The Onions with us, though plentiful, will be small, owing to the dryness. The spring-planted ones, though fair, are nothing to what we have had them. A good rain would increase the size of all these useful bulbs. We shall have none this season from 10 to 15 inches in circumference, even with the advantage of a heavy rain. Fine rains in June are what tell most on the Onion crop. Were we sure of their coming, and just when they were coming, a slight dusting with guano or horse dust between the rows, will have an astonishing effect. On the other hand the dressing with guano, if dry weather succeed, will do more harm than good. We gave a slight dressing of superphosphate and sewage water to an early piece of Onions planted out in spring. The state of the atmosphere and the readings of the barometer led us to expect a plentiful rain. Had the rain come we should have gained our purpose. We only had a few drops, and our kindness in other respects did more harm than good. We do not believe our sewage watering reached the roots, and the damped surface did the mischief. It kept the roots dry when they might have had plenty of moisture, as it passed them to escape into the atmosphere. In this case the tops soon began to show signs of exhaustion. The bulbs will only average some 3 inches in diameter. If we had merely let them alone they would have been larger. If the expected rain had come, they would have been much better still. The watering we gave would not have gone above an inch or so deep—a mere nothing to the rooting of an Onion, but a great help if only the heavy rains expected had come.

During the week we have seen some nice Onions at the cottagers' show at Woburn, but though fine they exhibited traces of the dry season. We have generally thought that we would not be much out of the way if our crops at all corresponded with those of our friends, Mr. Manning, of Tingrith, and Mr. McKay, of Woburn Abbey. In both cases their general crops of Onions will not be as they used to be in better seasons, though there would be plenty. At Woburn we noticed a very fine piece of winter Onions in a border. As a merely passing notice, we should judge many of the bulbs were from 4 to 4½ and more inches in diameter. We know the garden is pretty well supplied with water, but we do not know whether these had any given artificially or not. Some weeks ago, however, they had one good soaking rain.

Cauliflowers.—Two gentlemen the other day took notice of a border of Cauliflowers, one of them a gardener, the other a nurseryman, and the first especially well conversant with the ideas of watering we have fully set forth in these pages. This border is something like our fifth succession, for where there is little ground and a large establishment, the supply is best made, not by great glut, but by regular, if small, successions. At present this border will be our third; one lot is almost done, another is just coming in, and by the time they are mostly gone this border will be coming in, and be succeeded by small plants just turned out. Now, the border had carried a rather heavy mixed crop of Peas, Spinach, Lettuces, and Radishes. On clearing them off we never found a piece of ground so dry. On planting the Cauliflowers we made rather deep drills and soaked the plants in with sewage, and covered the surface with the dry soil. The leaves of these plants fell to the ground on the 22nd as if struck with paralysis. We could do nothing to help them, and we felt convinced they had that at their roots that would enable them to recover on the slightest change in the weather. By the 24th they showed they would bear the weather. The other day they looked tolerably well, so well, indeed, as to be admired by our friends,

and though they saw that every tank and reservoir was empty, they could not but hint that there must be some way of saturating them with water. We pulled our boot between the rows to the depth of 6 or 7 inches, to show how dry the soil was; with a stick we know we might have gone 6 inches deeper without finding a trace of moisture. What mere skiffing showers would ever wet such a depth of earth as dry as ashes? What would be the use of mere watering on the surface? The watering at the roots enabled the plants at once to grow, and once fairly set to work they would pump up moisture for themselves all the more easily because the already dry surface helped to keep the moisture about the roots. If the weather should continue dry, we shall most likely give a watering of sewage, which Cauliflowers can take pretty strong, but if possible, besides confining the water to the roots, we shall have a dry surface.

FRUIT GARDEN.

The chief work here has been shortening the summer shoots of bush, pyramidal, and wall trees, chiefly the lower parts of the trees, as the upper parts had been previously done. This balances the strength and vigour of the trees more than if such shortening and stopping had been done all at once.

Went over *Apricot* and *Peach* trees the second time, removing extra shoots, and spurring back, as the *Apricots* have grown freely again, especially after the watering with sewage. But for that, we are convinced a great portion of the fruit would have dropped, and several large branches would have given way. We are convinced that dryness at the roots is one chief cause why large branches of *Apricots* frequently die off without any apparent cause. When some of the *Apricot* fruit began to drop about six weeks ago, we were surprised to find the earth about the roots so very dry. On forking the surface, and making holes to let the water down, we were not at all afraid of strong sewage, knowing that it would be pretty well filtered and cleared before reaching the bulk of the roots. We would have mulched heavily the little space left between the walls and the crops on the border, in the case both of *Apricots* and *Peaches*, only we would thus keep out the sun heat, so favourable to root action and perfect ripening. Many of our wall trees we would wash if we could, if it were only to refresh the foliage, for insects have troubled us but little. In our orchard houses, though the fruit will be fair, the red spider is making its appearance, chiefly owing to our being unable to syringe. We must use more sulphur on the wall, &c., to prevent it spreading. The *Cherries* in orchard houses and on walls were never better. *Cherries* on standards out of doors were never more abundant, but they came small at first, and ripened very unequally—all in our favour, as we forget how many weeks we have gathered from them, and still on a short row of *May Dukes* there are a good many, and finer than the first, as the trees had each a small barrel of sewage, which told amazingly on the fruit. We hope it will do the same with *Morellos* on north walls, as, though plentiful, they were small when they began to colour. We should like to give them another watering. Even in their case the soil when examined was very dry, though receiving little direct sun.

With our scarcity of water, we are not so forward with *Strawberry plants* as we would wish to be. Took off some of the most forward runners layered in pots, layered more, and potted in 5-inch and 6-inch pots some of the most forward, using loamy soil moderately enriched, potting firmly, and shading a little from the bright sun for a few days, and to save frequent watering. As several times referred to, future success will chiefly depend on these simple points—keeping the bud of the plant slightly below the rim of the pot; fastening the young plant firmly in the pot, not merely using the fingers, but a blunt-ended wooden stick for the purpose; watering and shading a little at first, or syringing in bright sun, instead of shading, where water can be spared; and as soon as the roots are progressing freely, giving all the sunlight possible, whilst the pots stand on a hard bottom. As soon as the roots reach the sides of the pot, manure water may be given. The health and maturing of the plants before the end of autumn will be of more consequence than their luxuriance and size.

As to *drainage*, much more depends on the mode than on the quality and quantity of the drainage. In this case we do not like taking up room from the plant by a lot of drainage. Nevertheless, nothing spoils a good *Strawberry plant* in a pot sooner than the pot becoming waterlogged. We have often found a pot made so by the hole getting next to hermetically sealed, outside from the material on which the pot stood. The outside of the holes should, therefore, be examined at times. For saving room and keeping out worms, there is no plan better

than the following. Take a clean, dry pot, place one crock, a piece of a broken pot, say roughly from 1 to 1½ inch in diameter, over the hole in the bottom of the pot, but with its rounded or convex side downwards, so as to securely cover the hole. This will let water escape and keep out worms. Then lay a few more smaller pieces of broken pot round it—say three or four, though we are often satisfied with the one piece. On this or these lay a little clean, dry moss, which is the best, or a scattering of clean straw, chopped into from 1 to 2-inch lengths, which is the next best; over that a sprinkling of soot; and then, as a base, a handful of the roughest compost. Very little space may thus be taken up with drainage, and yet it will be thoroughly effectual. The water will pass quite freely enough, if the hole do not get clogged outside. Though we have used a little half-rotten dung and tree leaves to put over the drainage, the practice is not to be commended. Such material, besides being apt to become too close and unctuous, is also liable to have germs of fungi conveyed along with it, which are often difficult to get rid of. Simple modes are often the best. The moss is the best material for separating soil and drainage, and it has this advantage over chopped straw, or chopped clean litter, that it is in itself such an equaliser of moisture, parting with it freely when in excess, and retaining it to a certain extent when moisture is too limited.

ORNAMENTAL DEPARTMENT.

With many forebodings when we last wrote, we have reason on the whole to be thankful and satisfied. That dread Friday browned our beautiful *Coleus*, and though the points are acquiring their rich colour, a near inspection will show the leaves below somewhat browned. Rejoicing in the sunlight, as the *Coleus Verschaffeltii* does, it would appear that about 11° in the sun is as much as it can bear with impunity. Against the wall in the open air that day our thermometer rose to 117°. We could not say whether a good watering beneath would have helped much to neutralise the extreme heat and brightness of the sun. In a few days, if the weather be favourable, the young growth will conceal all the browned leaves, and until then we would wish the plants to be looked at from a distance instead of close at hand. The fine bed at *Woburn* had suffered on the same day, but you could only observe it when close to it on the 27th, and every trace will be gone in a few days. We have told several times before what that bed was bordered with in former years. This season the combination was the most beautiful we ever saw.

Iresine Herbstii, though a drinking plant, stood the ordeal of the heat and dryness extremely well. We noticed at *Tingrith* that *Iresine Berkeleyi*, in a prominent place, had been a little browned, but the brownness was gone before that Friday. We have not tried *Iresine Lindeni*, a kind with a narrow purple leaf, which we hope will be useful. *Herbstii* is very effective in a moist autumn; in such a summer as this the plants are apt to get rather lumpy, and the leaves round and large.

We have not lost more than half a dozen out of long lines of *Calceolarias*, which are a mass of bloom, and now we hope they will hold on, as even these drizzling rains in the morning have greatly helped them. The ground seems so dry that the roots must have gone down to a considerable depth. We come to this conclusion, for though in other cases we lost few plants, yet the bloom so flagged on small beds and where the plant was used chiefly as edgings, that we had to cut off more than we liked; but then in all such cases we could not stir the soil so deeply previous to planting as we could do in the case of these rows and in that of larger beds, which look now as if there had been no such week as that which terminated on the 23rd ult. Say what we will, and use the brightest-coloured yellow-leaved *Pelargoniums* as you will, and the most graceful and finest-foliaged *Marigolds*, none will make up for the want of the *Calceolaria* in flower beds. If Mr. Robson saw these just now after the severe ordeal through which they have passed, whilst advocating early planting, as he does so well, he would own there was also something to say on the other side.

Our *Hollyhocks* would please some people this season; the flowers are small, and the plants are dwarfs. Giving them any water was out of the question.

We had much to do in bringing up arrears of potting, and must think ere long of propagating for the flower beds next season.—R. F.

TRADE CATALOGUE RECEIVED.

Ant. Roozen, Florist, Overveen, near Haarlem, Holland.—*Catalogue of Hyacinths, Tulips, Crocus, Narcissus, and other Dutch and Cape Bulbs.*

TO CORRESPONDENTS.

•• We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

SECRETARY EXHIBITING (H. S. G.).—There is nothing illegal in his exhibiting, if there is no rule to the contrary.

TEMPERATURE (W. H. O.).—What was the greatest heat in England and in the East Indies in 1868? is a question too wide for us to answer. The greatest heat in the shade near London in July was 93°, and at Calcutta probably not 5° more in the hottest month; but there the differences in the temperature between hour and hour, and night and day, are but small compared to what they are in this country.

PELAGONIUMS (Veritas).—The box was smashed, and all the petals were intermixed. They appeared to belong to some of the French kinds.

TRICOLOR, BICOLOR, AND DISCOLOR (R. G.).—Tricolor means three-coloured, bicolor and discolor two-coloured, and four-coloured would be quadricolor. Your friend is right in saying that bicolor and discolor mean the same number of colours, but wrong as to the number.

PETRIFIED FIG (C. Pocock).—We believe it to be a fossil Echinus or zoophyte; we cannot decide as to the species unless we see the specimen. A similar one is engraved in some of the books on British fossils, but we forget which.

LAPAGERIA ROSEA CULTURE (Subscriber).—This plant is not difficult to cultivate either in a pot or border. In pot culture the plant should have a rather large pot. Good plants can be grown in 11-inch or 13-inch pots, the shoots being trained to a trellis, a flat one being most suitable. Whether grown in a border or pot, good drainage should be secured. A border 4 feet long, 2 feet wide, and 2 feet deep, clear of the drainage, will support a large plant. The drainage should be, as already stated, very good, for, during the season of growth, the watering must be plentiful, and at no time must the soil be allowed to become dry. At that time a plant in a pot will require a gallon daily, and one in a border thrice the quantity. When the growth and flowering are over, less water will, of course, be required. The soil most suitable is fibrous brown peat, free of sticks, torn in pieces, but used rough without any admixture. If the peat is deficient in sand, the latter should be liberally added. A light airy position in an ordinary greenhouse will suit it, but it must be shaded from direct sun. The shade must not be produced by climbers. The north side of a span-roofed house, or the east or west end of a house, will answer well, though almost any position will do if not dark nor exposed to the midday sun. It is impatient of having its roots disturbed, and should only be interfered with when at rest, and then so as not to injure the roots.

BUDDING ROSES ON THE MANETTI STOCK (Constant Reader).—The buds should be put in quite close to the ground, or as near that as practicable, so that when the plants are placed in their final position the union of the stock and bud may be covered with soil. The buds take quite as freely on the Manetti as on the Briar stock, and there is this advantage—that the operation can be performed as late as September. Budded plants are of much freer growth than grafted plants; and whilst budding may be done in the open air, a close frame or house and bottom heat are necessary for grafting.

VINES ON THE BACK WALL OF A VINERY (Ignoramus).—The Vines on the roof will shade the back wall too much for successful Grape culture. Having failed with Figs, it is not likely you can grow Vines, as Figs will succeed on the back wall of a vinery where the Vines are not closer together than 3 feet or 3 feet 6 inches. On the back wall, Vines do not require different treatment from those on the rafters. We think it unsuitable.

DRIVING WORMS OUT OF POTS (J. W. M.).—The lime water is made by pouring twenty gallons of water on 10 lbs. lime, stirring well up, and allowing the lime water to stand forty-eight hours, then watering the plants with the clear water, having previously stopped the holes in the pots. Give water enough to stand on the surface. In about three hours the obstruction to the drainage should be removed. The worms will by that time have come out of the pots or been destroyed. It is stated that a solution of 2 ozs. of soda to a gallon of water will destroy them and benefit the plants, but we have not tried it.

TOBACCO AND BITTER ALOES FOR DESTROYING APHIS (Idem).—Tobacco water and bitter aloes have for some time been used successfully for destroying aphides on Roses and other out-door plants, but the tobacco water is sufficient, and the aloes a superfluity. Four ounces of tobacco to two gallons of boiling water allowed to stand until cool, and then strained, will destroy all kinds of aphides.

PRUNING CRASSULAS, CACTUSES, AND CLERODENDRON BALFOURIANUM (H. S. B.).—We should cut back each Crassula shoot that has flowered to within an inch or two of its base, leaving the others entire, for those not flowering this year you will need to retain for next season's bloom. Those cut back now will produce flowering shoots in the second year. Old plants, from their size, are preferable to young plants, but why not have both? The Cactuses may also be cut down, but we should confine ourselves to cutting-out the old parts, leaving as much of the young fresh growth as possible. It will not hinder their flowering next season. Straggling shoots of the Clerodendron ought also to be cut-in now, but we should reserve the general pruning until spring, well thinned-out the growths in February, previous to fresh potting and starting into growth. It is best trained on a trellis; you may indulge your taste as to

the form. The shoots ought to be kept rather thin, but let them cover every part at from 3 to 4 inches apart. On a roof trellis the shoots ought to be kept about 6 inches apart, and at about 9 inches from the glass.

WYON ELM (W. N. M.).—We think it is simply honeydew, which is a great attraction to the wasps and small humble bees. The leaves turning yellow is frequently a consequence of their pores being closed by the honeydew, and the drought we have recently experienced has also, no doubt, exerted an influence. We do not think you can do anything to the tree. A good rain will, no doubt, set all right again. The wasps and bees do not injure the tree.

ORCHARD HOUSES (Noris).—There have been no subsequent articles by the same gentleman, but it is probable he may favour us with others when time permits. You can have Peavson's little volume, "The Orchard House," free by post from our office if you enclose nineteen postage stamps with your address.

PEACHES FALLING (C. S.).—Your Peaches are ripe, but badly coloured. We think you have left too many on the trees, and that that is the cause of their falling by hundreds.

PEACH LEAVES (G. W.).—The leaves of your trees are scalded through water resting upon them, and a deficiency of ventilation early in the morning when the sun has been so bright and fierce.

EARLY PEACH, PLUM, AND CHERRY (Subscriber).—The earliest Plum is Rivers's Prolific. We would, however, recommend you as a single variety, Jefferson; of Peaches, Early York or Royal George; of Cherries, Black Circassian. Cherries require a considerable amount of air to set their flowers; we do not think you would be very successful with them on a back wall; Plums would do better.

DOUBLE-BLOSSOMED PEACH FRUITING (N. H., Southampton).—It is not at all an unusual occurrence for the double-blossomed Peach to fruit abundantly, and in fine warm autumns the fruit ripens perfectly, but is not of good quality, being rather astringent. It is utterly unworthy of being grown as a fruit. It would, no doubt, during this intense heat be beneficial to give the tree a good soaking.

FUCHSIAS AT EXHIBITIONS (R. S. T.).—The prize having been offered for "six Fuchsias, distinct varieties," and no restriction being given, any variety was admissible, whatever its character. Fuchsia gracilis variegata is no more hardy than many others. It is used for bedding solely on account of its beautiful foliage. The judges could not disqualify.

KEEPING RIPE PEACHES (Idem).—Keep them in the coolest place you can find.

SOFT SOAP (G. C.).—If you refer to page 23, you will see that 2*l.* per lb. was a mistake. We believe you can obtain it wholesale for 3*d.* per lb., or even less. A wholesale dealer would supply you at a less rate than you are paying, if you ordered a quantity. We cannot recommend dealers.

MELONS DECAYING (P. E. C.).—It is difficult to state the cause of Melons decaying before they are ripe. We should attribute it to want of heat, but it may be caused by too much moisture. When Melons are ripening they require but little moisture, and should be kept dry and have plenty of heat and air. Without particulars of the cultivation afforded the plants, it is difficult to state the cause of failure. We could not say where the fault lay without further particulars.

PRIMULA CORTUSOIDES AMENA (J. S. B.).—It is hardy, but if the situation is cold and wet it should be wintered in a cold frame. A compost of two parts light fibrous loam, one part leaf soil, and one part sandy peat, with a sixth of silver sand, will grow it well. Good drainage is necessary. The plant should have an abundant supply of water when growing, and even when at rest the soil should be kept moist. After April it will do best in the open ground in a position shaded from the midday sun. We have no doubt that your plant will flower next spring if taken up carefully in autumn, potted, and wintered in a cold frame with plenty of air. If the situation is well drained we should leave it undisturbed, putting round it a light mulching of leaf soil or cocoa-nut fibre refuse. It flowers in April and May, and is very beautiful.

BLACK CHERRANTS (James Carter & Co.).—The Black Currant of which you sent branches appears to be a profuse bearer, but the berries are not so large as those of Black Naples; they hang firmly on their stalks, which is a great recommendation, and their flavour is good.

CAMELLIA LEAVES FALLING (J. T. S.).—It is not likely that the shading could have anything to do with the scorching of the leaves; and we do not think they are scorched, but that there has been a great deficiency of root action, the roots not supplying nutriment for the full development of the leaves, and when this is the case it is not unusual for the leaves and even young shoots to turn black and decay or fall. The only remedy is to repot at once in turf cut from a pasture of light loam, taking off the turf about an inch thick, tearing it to pieces with the hand, using it rough, and pressing the soil firm. Remove as much of the old soil as you can without injuring the roots. Water freely.

BEECHWOOD MELON (T. S.).—The old true Beechwood is very scarce. Not one out of a hundred cultivators has the true stock. The Beechwood, as we see it at the present day, is a long elliptical fruit, ribbed, very often deeply, seldom or never netted, thin in flesh, not melting but tough, insipid in flavour, and not often exceeding 2 lbs. in weight. The true Beechwood is in form more spherical than elliptical, and flattened at the ends like an orange, very slightly ribbed, and beautifully netted; flesh thick, melting, and finely flavoured. Under good cultivation it usually attains a weight of 4 lbs., often much more. We cannot recommend one seedsman in preference to another, such a course would be unfair.

INSECTS (B. Maries).—Your Rose leaves have been disfigured by the leaf-cutter bee, *Megachile centurialis*, which has been very abundant this season. (*E. P., jun.*)—The Elm trees on the Parade and in the People's Park, at St. Helier, Jersey, are infested with the Scolytus destructor, which lays its eggs in the bark of the trees, the young grubs burrowing off the central burrow, made by the female, at right angles, and so cutting through the sap vessels and in time destroying the trees. Such is our opinion at least, and that of many other naturalists; but another opinion is also current, that the trees are never attacked by the insects until they are in a state of disease from want of drainage, or want of water, or bad soil, &c. In France, as well as in the Regent's Park, London, some benefit has been obtained by partial disbarking the trees whilst young, taking care to burn the bark. It would also be serviceable if the trees were

surrounded with tarred haybands at the time that the perfect insects are making their appearance.—I. O. W.

POULTRY, BEE, AND PIGEON CHRONICLE.

EARLY EGGS FOR HATCHING.

It need hardly be pointed out that to the breeder of fancy poultry it is of very great importance to obtain eggs from his best hens early in the year, whether for sale or for his own use. I say from his best hens, because eggs from pullets are, of course, to be had easily in any quantity, but are by no means so good for early broods, producing chicks with less stamina, which fledge more slowly, and are altogether less adapted to withstand the vicissitudes of the early months. It is, therefore, to the early laying of the mature hens I purpose to devote this paper, the present being the time which my own experience leads me to believe has much influence upon the matter.

It has been said over and over again that early eggs cannot be obtained except from pullets, and also that there are no artificial means by which the production of eggs can be either hastened or retarded, being a natural process incapable of being interfered with. Both statements are generally true, but they are only true relatively, and any intelligent breeder who knows definitely what his object is, has very great power over the degree in which it shall be attained. If he wants, for instance, merely the greatest possible number of eggs in a year, his treatment will not be that I am now considering. But the fancy breeder does not so much seek a high average as to have eggs in good time. He knows that every egg early in the year may produce a valuable fowl, or will be saleable at a high price, whilst later on it will only realise its mere food value; so that twenty eggs in August may be of less account than one in February. It is on this principle he must proceed.

All my observations during several seasons have satisfied me that the time at which a bird begins laying depends chiefly, after allowing for differences of breed and character, upon the time when she left off. If a Cochin hen has been laying very late in the autumn, almost, in fact, into the winter, it is absurd to expect she can begin again till the season is well advanced. Cochins and Brahmans, and even Hamburgs, will, in fact, often lay till more than half through a severe moult, which is, of course, a drain upon the system so extensive as to demand much time for recovery. But, on the other hand, if a hen has had a late brood of chickens, it will almost always be found that she lays in good time, and for several years I have found no difficulty in getting eggs from a portion at least of my hens by Christmas, or even before.

As the hens become broody towards the end of July and August, therefore, let them either be allowed to sit, or if that be inconvenient, to remain on the nest for a month or five weeks. This will not only give the system a rest, but it actually induces or hastens the moult, the feathers dropping off very frequently almost in handfuls. The process will generally be half through, in fact, by the time the bird is turned off, and she will then rarely lay again till after it is completed; whereas, if the moult finds a hen laying, she will often, as I have said, continue till nearly through. A little meat and ale will also help to hasten the process, and plenty of fresh green food must also be supplied. Under these conditions, and not being reduced by egg-laying, the moulting will be hastened very considerably, and the bird will be in laying condition much sooner than if turned off her nest directly she is broody for the sake of her autumn eggs, as is generally done.

Of course some breeds are less prolific than others, and it is much more difficult to get early eggs from a Dorking than a Cochin; but in all cases much may be done by such a system of management in the case of breeds which evince a regular desire for incubation. There are, of course, several minor matters to observe, such as the selection of birds hatched in good time, and which will, therefore, moult tolerably early; the providing tight and well-sheltered houses, &c.; but the securing the cessation of eggs for some little time before the moult, and the hastening of that process, have by far the greatest influence on the matter, so far as my observations go.

There is one more point to be mentioned. Though the mating will not, I think, hasten laying in the least, I have generally found that even hens which left off early in the autumn did not lay till three weeks or a month after enjoying the company of the cock, and not then unless he also were in good condition. The hens should therefore be mated by the

end of November, and for early eggs only cocks penned up, which have moulted well and regained perfect health and vigour.—L. WRIGHT.

WATCHING THE CHICKENS.

By some people, but not, certainly, by readers of "our Journal," watching the chickens would at once be set down as an amusement suited to the buttercup-and-daisy-gathering age. Be it so; sensation novels, railway running about, and the like, have unsettled many minds, and made people enjoy less, or unfitted them to enjoy at all, pleasures found at home. But yet a taste for simple enjoyments is a healthy taste, and one which never tires. Still, tastes will differ to the end. "I cannot understand," said a young lady to me, "whatever there is for you to make a fuss about, week after week, in that gardening and poultry paper of yours." I replied "I cannot think why you are so particular to have the newspaper the first day that it contains the month's fashions."

Well, tastes will differ. Thus some people cannot even see a joke. A man with a keen sense of humour was looking through a gallery of pictures with a friend who had no more sense of humour than an iron bar. Presently they came to a picture of two cats fighting. "Ah," said the quick-witted one, "evidently by Claude (clawed)." "Indeed, it is not," replied the matter-of-fact man, "I assure you that Claude painted only landscapes, of which I have seen many," &c. Not even Sidney Smith's remedy for a dull man—viz., to have a surgical operation performed upon his skull, in order to get a joke in, would suffice for such a one. Yet dullness is at times amusing, as "Did 'em wear tin gaiters then?" said an old farmer who was looking at a brass in a church. But I am conscious that I am rambling, roaming far away from my subject.

To return. During this hot weather, now reaching over many weeks, when I was afraid to be in the sun, lest, as somebody said, "a small heap of bones and a grease spot should be found instead of one's self"—sitting, then, in the shade of a far-reaching elm that throws its shadow on some part or other of a greensward the summer day long, I was day after day reading, but—I could not help it—"from my sleek hand dropped" very often not "the gathered rose," as Rogers describes the child who had fallen asleep, but dropped my book to my knee while I watched the chickens. Perhaps they this year were even more attractive than usual, being groups of tiny Bantam chicks—little neat-formed "sprack" (sprack is good Wiltshire, though not good English) Game Bantam chickens from eggs of Mr. Crosland's. Let me prattle—a child-like word becomes a child-like pleasure, as some one, not a reader of "our Journal," but one who has taken it up by mistake, would say—let me prattle, then, about these times. How tiny, indeed, they are when from the little eggs they first come, seeming too small to get on their feet; but soon they do, and totter about an inch or two, and then make a tumbling plunge under the feathery care of all warmth and comfort beneath the hen. Then follow the first pickings and sippings, trying the appetite with that as yet unknown thing—food. But how rapid is the progress of chickens well cared for—that is, understandingly cared for. The warm south-fronted outhouse first receives them, and next day they venture upon little, still tottering walks, and one bolder or stronger than the rest even circumambulates the coop, and feels as he felt who first sailed round the world. The following day they are on the lawn, shaded duly from midday sun, and then note their progress. Little aerial fly-catchings are attempted, and wanderings and scratchings with feeble feet, and the first worm found and run away with, the fortunate or unfortunate chick (for he usually loses it) duly chased by the rest, eager to become worm-devourers. Then some one or other of the brood strays into some laurel bush, and, like the babes in the wood, is lost, and shrilly yelps forth his sorrow to the sore discomfiture of the listening but not seeing hen. But head grows with body; soon they know their feeder and his wonted call, and run to meet him with expanded wings assisting their legs, for they soon become things with wings, each week the useless winglets growing more and more into useful wings.

When the first month is turned, as I notice in my little Game Bantam chicks, the little pullets have their golden hackles coming, seen as they run from me, and resembling tags of gold thread hung to the back of their necks. Then the little cockerels are developing, for here and there a black or red feather is appearing, and a cock-pheasant-like hue is visible in their plumage. In watching a couple of broods of Game Ban-

tams of a similar age it is interesting to notice the slight variations in colour, and how gradually the owner comes to mark with the eye and know individuals, as an eastern shepherd gets to know his flock, though a stranger would think all pretty nearly alike. Adult-like and yet not adult feathers come on; and the little sinewy legs, ludicrous miniatures of Game fowls' legs, are to be noticed; and here and there the eye marks what will be the gems of the brood. Now, too, is the time of peace, when all are good boys and girls, and no fighting; it is the time, too, of affectionate clustering together in the sunshine, and posing in graceful attitudes, or having or shamming to have a dust bath in common. But lo! six weeks have turned, and the weather is warm, so away shall go the brood hens. The more independent lot show no signs of regret, but go to roost like old birds, struggling, however, for the inside places. These sturdy independents wander further than before and wherever they choose, and are evidently glad that mamma is gone with her unceasing and commanding cluckings and callings. The less independent give forth a chorus of miserable yelps on discovering that they are alone in the world; and at bedtime, after a few manly attempts at roosting, fearing, perhaps, that they should fall off, they huddle together in the corner of a manger, and fancy they are brooded as formerly.

Thus I have noted down my "watching the chickens" from their first appearance in the world to their life of independence. I have noted all down, not in a very particular manner, or in a very orderly style, perhaps; but I am not such a particular man as he was who took me up sharply when I said, "Now I will put on my coat and waistcoat," saying, "That is incorrect, you mean you will put on your waistcoat and coat;" or a brother particularian, who laid much emphasis on the order of the words "I eat and drink," eating at dinner, and having a tumbler of water brought in an hour afterwards.

But particularians, avant! I have noted down in my own way and told how I have watched the chickens, an interesting pastime—one giving pleasure, and tending to make a man love still more his own home and feel how dear it is to him, and that, loving it, he does not need to rove away and rattle along the railway in search of happiness. The town man, and especially he of London town, needs a summer change. But where to? To woods, and fields, and country scenes, to relieve and comfort eye, and ear, and mind. But we in the country dwelling have all these comforts continually, and can well remain in the spring, summer, and autumn, not wishing for change. I speak of those who love and not merely endure the country. I speak of those who feel an interest in all around them—people, garden, and pets, in-door and out, and these enjoy their life and bless the Almighty for their lot and His good gifts. —WILTSHIRE RECTOR.

APPLETON-LE-STREET POULTRY SHOW.

The poultry show in connection with the Floral and Agricultural Society held at Appleton-le-Street, near Malton, last week, was a very creditable one, and proves what can be done by careful management and judicious arrangements to raise a small village show into an important district one. Most of the classes were well filled, and in some the competition was very close. The *Dorkings* were large and good, but some otherwise good birds lost all chance from imperfect feet. The *Brahmas* were very few in number. The Dark *Cochins* were good, but the *Buffs* very poor. The *Spanish* formed a very good class, and the winning pen, belonging to Mr. Holmes, of Driffield, carried off the silver medal for the best pen of poultry in the yard. The *Game*, also, were a good and numerous class. The *Hamburgh* class was well filled with some good birds. As all the varieties were shown together, it was difficult to decide on the merits of the different pens; we hope next year they will be divided into two if not four classes. The class for crossbred farmyard birds brought out some really good and useful specimens of the right sort. The little *Bantams*, chiefly *Game*, were as good and pretty as usual. Some of the *Geese* were very fine and large. *Rouen Ducks* were numerous, but sadly in the moult. *Aylesburies* were large, but few in number. Special prizes were given for young poultry for table purposes, which brought a good show of useful chickens and heavy ducklings, but the goslings were not so good.

WHITE COCHINS.—There are only two or three poultry shows where White Cochins are separately classed; this prevents many from exhibiting, and I think the committees only want reminding of this exclusion to remedy it.—F. R.

WARRINGTON POULTRY SHOW.—The date of the entries closing for this Show has been extended to August 8th, and we trust that this will be the means of bringing increased support

from exhibitors, especially as the Show, if successful, will be repeated on a larger scale next year. The amount of subscriptions already collected, exclusive of the town of Warrington, is £400, and the prizes are liberal.

THIRSK POULTRY SHOW.

The following prizes were awarded at the first Show of the Thirsk Agricultural Society, which took place on July 27th.

DORKINGS.—1, J. White, Northallerton. 2, W. Bearpark, Ainderby Steeple. **GAME**.—1, J. Watson, Knaresborough. 2, R. Akenhead, Otterington Hall. **SPANISH**.—1 and 2, W. Bearpark. **COCHIN-CHINA**.—*Buff*.—1, R. E. Brown, Osvaldikirk. 2, W. & F. Pickard, Leeds. *Partridge*.—1, W. Barnes, Thirsk. 2, W. J. Stewart, Darlington. **BRAMA POULTRY**.—1, F. Horseman, Borough-bridge. 2, J. Bell, Thirsk. **HAMBURGH**.—*Golden-spangled*.—1, Mrs. Plummer, Eastergate. 2, W. Bearpark. *Silver-spangled*.—1, J. Best, Borough-bridge. 2, W. Manfield, Thirsk. **GOLDEN-PENCILED**.—1 and 2, W. Bearpark. *Silver-penciled*.—1, W. H. Atkinson, Thirsk. 2, W. Bearpark. **BANTAMS**.—*Black*.—1, G. Atkinson, Croft. 2, J. Watson, Knaresborough. *Game*.—1, R. J. Stewart, 2, E. Barker, Stokesley. *Any other Variety*.—1, G. Robinson, Thirsk. 2, T. Tweedy, Thirsk. **DUCKS**.—*Rouen*.—1, C. Graham. 2, G. Smith, York. *Aylesbury*.—1, G. Smith. *Any other Variety*.—1, R. Wilson, Thirsk. 2, M. Fairy, Thirsk. **TURKEYS**.—1, Rev. G. Hustler, Sulhulphed, York. 2, J. Arrowsmith, South Kildington, Thirsk. **GEESE**.—1, Rev. G. Hindle. 2, J. B. Braithwaite, Northallerton. **GUINEA FOWLS**.—1 and 2, R. Wright. **SELLING CLASS**.—1, W. R. West, Sowerby Grange, Thirsk. 2, G. Calvert, Darlington. **ANY OTHER VARIETY**.—1, C. Walker, Borough-bridge. 2, T. Barnett, Bishorth. **CHICKENS**.—(Ten of four).—1, J. White, Warley, Northallerton.

PIGEONS.

CARRIERS.—1, G. Sadler, Borough-bridge. **TUMBLERS**.—*Red-wood*.—1, C. Anton, York. *Any Variety*.—1, C. Anton. **POUTERS**.—1, W. Bearpark. **JACOBIANS**.—1, R. Wilson, Thirsk. **FANTAILS**.—1, W. FISHER, THIRSK. **TOUMPTERS**.—1, C. Anton. **OWLS**.—1, W. Bearpark. **NEWS**.—1, W. EATPARK, THIRSK. —1, R. Wilson. **TURBANS**.—1, R. Wilson. **DRAGONS**.—1, J. Cludate, East Howick, Ripon. **ARCHANGELS**.—1, R. Wilson. **ANY OTHER VARIETY**.—1, W. Bearpark.

JUDGES.—*Poultry*: Mr. Barker, York. *Pigeons*: Mr. E. Wilson, York.

PRESTON POULTRY SHOW.

The first Show of the Preston Agricultural Society was held July 27th and 28th. The weather was very fine, the ground in all respects suitable, and being very easy of access the Show was well attended. The extent of the show-ground was seventeen acres, and the whole was well filled.

The poultry was not numerous, taking into account the liberal prizes offered, the number of pens being a little under two hundred, but, as a whole, the quality was very good. The *Dorkings* were in poor condition. The single *Spanish* cocks were mostly in deep moult, but the prize birds were good. The *Game* classes contained some good pens, but many of them were much out of condition. The *Hamburghs* were not numerous, but the birds were good. The *French* fowls were very good, and the *Brahmas* were the best class in the Show. The *Rouen Ducks* were good, but the entries were small in all the *Duck* classes.

DORKINGS.—1, Gunson & Jefferson, Whitehaven. 2, J. Robinson, Garstang. *hc*, Hon. H. W. Fitzwilliam, Wentworth Woodhouse, Rotherham. **FRENCH FOWLS**.—1, H. Beldon, Gaitstock, Bingley. 2 and *hc*, Hon. W. H. Fitzwilliam. **BRAMA POULTRY**.—1, J. H. Pickles, Birkdale, Southport. 2, H. Lacy, Hebburn Bridge. *hc*, F. H. Green, Bertelvoelze, Windsor, Belfast. 3, J. H. Pickles, W. GARDON, CHESTER. **SPANISH**.—1, F. & C. Haworth, Haslingden. 2, C. W. Brierley, Middleton. *hc*, H. Wilkinson, Farby; F. & C. Haworth; J. Leeming, Broughton, Preston. **GAME** (any colour).—1 and 2, C. W. Brierley. *hc*, B. Bee, Goosnargh (Black-breasted Red); T. Waring, Preston (Black Red). **COCHIN-CHINA**.—1, T. Stretch, Ormskirk. 2, J. H. Dawes, Birmingham (Buff). **HAMBURGH**.—*Golden-penciled*.—1, H. Pickles, jun., Erby. 2, H. Beldon. *Silver-penciled*.—1, H. Pickles, jun. 2, H. Beldon. *Golden-spangled*.—1, H. Beldon. 2, H. Pickles, jun. *Silver-spangled*.—1, H. Beldon. 2, H. Pickles, jun. *hc*, F. Fielding, Newchurch, Rossendale. **GESE**.—1, H. Beldon. 2, H. Pickles, jun. *hc*, F. E. Eutwick, Checkheaton, Leeds. 2, J. Oldford, Wakefield. **BANTAMS** (any colour).—1, S. & R. Ashton, Roe Cross, Mottram. 2, H. Beldon. *hc*, J. Walker, Halifax (Black). **GEESE**.—1, E. Leech, Rossendale. 2, S. H. Stott, Rossdale. *hc*, W. H. Butcher, Preston. **DUCKS**.—*Aylesbury*.—1, E. Leech. 2, S. H. Stott. *Rouen*.—1, E. Leech. 2, T. Wakefield. *hc*, H. B. Smith, Broughton; S. H. Stott; T. Waring, Preston. **ORNAMENTAL WATERFOWL**.—1, C. W. Brierley. 2, H. B. Smith (Shield Ducks). **TURKEYS**.—1, E. Leech. 2, L. Anyon, White-le- Woods, Chorley.

SINGLE COCKS.

DORKING.—1, J. Robinson. 2, Hon. H. W. Fitzwilliam. **SPANISH**.—1, H. Beldon. 2, J. Leeming. *hc*, W. G. Mulligan, Springhead, Belfast. **GAME**.—1 and 2, C. W. Brierley. **GAME BANTAM** (any colour).—1, Harwood & Buckley, Accrington (Black Red). 2, Bellingham & Gill, Burnley.

PIGEONS.

CARRIERS.—1 and 2, T. Pincock, Preston (Dun and Black). **TUMBLERS**.—1, J. Hawley, Bingley. **BARBS**.—1, T. Pincock (Black). 2, H. Yardley, Birmingham. **OWLS**.—1, J. Hawley. **POUTERS** or **CHIFFERS**.—1, J. Hawley. **FANTAILS**.—1, H. Yardley. 2, J. Kemp, Haslingden. **TURBANS**.—1, J. Kemp. 2, H. Yardley. **DRAGONS**.—1, H. Oakley, Preston (Blue). 2, H. Yardley. **TOUMPTERS**.—1 and *hc*, J. Hawley. 2, J. Turner, Broughton (White). **JACOBIANS**.—1, J. Hawley. **NEWS**.—1 and 2, H. Yardley. **ANTWERPS**.—1, J. Oldford. 2, W. H. Mitchell. **ANY OTHER VARIETY**.—1, H. Yardley. 2, J. Hawley.

JUDGES.—Mr. R. Teebay, Fulwood, Preston, and Mr. J. Dixon, North Park, Bradford.

CROYDON POULTRY SHOW.

This Show, held in connection with that of the East Surrey Agricultural Association, took place July 27th. The arrangements reflected great credit on the Secretary, Mr. W. H. Rowland. Mr. Billett, of Southampton, supplied his pens, which are roomy and convenient, and, which is of great importance, they are of such a height as to prevent the largest birds injuring themselves against the tops.

The best classes were *Dorkings*, *Spanish*, and *Hamburghs*. The first and second prize pens of *Game Bantams* were very good. Of the larger *Game* fowls there was a very poor show, there being scarcely a pen

worthy of the name. Aylesbury and Rouen Ducks were good, but the "Variety class" very indifferent. Only one pen of Turkeys was entered. Geese were more numerous, but the quality was indifferent, and we noticed but little attention had been paid to matching the birds.

DOBRINGS.—1, C. Havers, Ingatstone. 2, Ivory & Son, Dorking. SPANISH.—1, P. James, Peckham Rye. 2, Rev. J. Randolph, Tottenham. RED BREASTED.—1 and 2, W. Irving, Faversham (Creve-Coeurs and Hondans). 3, Rev. N. G. Ridley, Newbury (Malay). *hc*, J. Pares, Postford, Guildford (Japanese Silkies). GAME.—1, E. C. Good, Carshalton. 2, C. Purrott, Croydon. HAMBURGS.—1, Miss C. E. Palmer, Lighthouse, Warwick (Golden-spangled). 2, C. Havers (Golden-pencilled). *hc*, T. Penfold, Newhaven (Golden-spangled). COCHINS and BIANTAMS.—1, J. Pares (Light Brahma). BANTAMS.—1, T. R. Edridge, Croydon (Black-Red Game). 2, G. H. Gillham, New Cross Road, London (Game). *hc*, H. Nalder, Croydon (Black-Red Game). 3, Rev. A. H. Bridges, Redington House, T. P. Keen, Croydon (Duckwing Game). TURKEYS.—1, Rev. N. J. Ridley (Cambridge). GESE.—1, W. Oakley, Oxted (Grey). 2, E. Byron, Condon Court. *c*, J. Pares (Sehatopol); C. Pnrrott, Goslings.—1, W. Oakley. 2, E. Byron. *hc*, T. Chandler, Purley Oaks. DECKS.—Aylesbury.—1, 2, and Extra, W. Oakley (Ducklings). Rouen.—1, W. Oakley. 2, J. Ivory & Son. ANY OTHER VARIETY.—1, 2, and Extra, J. W. Sutherland (Sheldrake and Wild Ducks).

The Judges were Mr. Elgar, Red Hill, Surrey, and Mr. G. S. Sainsbury, Devizes.

SLEAFORD POULTRY SHOW.

THE second Exhibition of the Lincolnshire Agricultural Society was held at Sleaford on the 27th, 28th, and 29th of July. The show of poultry and Pigeons consisted of upwards of 150 pens.

DOBRINGS.—1, G. Andrews, Tuxford. 2, R. Wood, Clapton, Thrapstone. 3, J. Hornsby, Grantham. *hc*, T. F. A. Burnaby, Newark. 4, W. Dudding, Howell, Sleaford. COCHINS (Any variety).—1 and Sir T. Whitehead's prize, M. A. Sauray, Radcliffe-on-Trent (Buff). 2, H. H. Rolston, Banwell, Oundle (White). 3, J. K. Fowler, Aylesbury (Partridge). *c*, J. H. Dawes, Birmingham (Buff). BRAHMS.—1, C. Chaloner, Whitwell, Chesterfield. 2, J. Elgar, Newark. 3, C. Layland, Morris Brook, Warrington (Dark). POLANDS.—1, W. R. Patrick, West Wiche, Lynn. 2, J. P. Mansell, Lincoln. FRENCH.—1, Mrs. J. Cross, Brigg (Creve-Coeur). 2, G. Andrews, 3, G. S. Harvey, Dorrington, Sleaford (Hondans). *hc*, W. O. Quibel, Newark (Hondans). *c*, J. Elgar (Hondans). 1, J. Manton, Englishwode (Cr. or Buff). Mrs. F. Cross (Hondans). W. O. Quibel (Hondans); J. K. Fowler (Game). ANY VARIETY.—1 and Sir T. Whitehead's prize, C. Chaloner, Chesterfield. 2, J. Laming, Cowburn, Spaulding. 3, F. Tomblin, Thorpe Latimer, Sleaford (Black-breasted Reds). SPANISH.—1, T. C. & E. Newbitt, Epworth. 2 and 3 Withheld. HAMBURGS (Any variety).—1, J. F. Lovingside, Newark (Golden-spangled). 2, C. Edwards, Holbeach (Golden-pencilled). BANTAMS.—*Game*, any variety.—1, C. Chaloner. 2, J. G. Lyall, Middle Basson (Black-breasted). ANY OTHER VARIETY.—1, T. C. & E. Newbitt (Black). 2, Hon. and Rev. F. B. M. M. Black. ANY VARIETY.—1, C. Chaloner. 2, J. Laming (Game). 3, T. F. A. Burnaby (Dorking). GESE.—1, E. Leech, Rochdale. 2, J. K. Fowler, 3, Withheld. DUCKS.—Aylesbury.—1 and 2, J. K. Fowler. 3, J. Hornsby, Grantham. Rouen.—1, E. Leech. 2, W. Dudding, Howell, Sleaford. 3, K. Wood. ANY OTHER VARIETY.—1 and *hc*, W. Dudding (Buenos Ayres). 2, S. & K. Ashton, Mottam (Gargant). 3, J. K. Fowler (Carolina). TURKEYS.—1 and extra prize, E. Leech. 2, M. Kew (Cambridge). GENEA FOWLS.—1, T. C. & E. Newbitt. 2, Mrs. G. Burton, Barrow-on-Union. SELLING CLASS.—1, T. C. & E. Newbitt. 2, C. Chaloner (Game). 3, J. Hornsby, Castle Gate House, Grantham.

PIGEONS.—Carriers.—1, H. Yardley, Birmingham. 2, J. Elgar. Pouters.—1, H. Yardley. 2, J. F. Farlow, Peterborough. Tumblers.—1, H. Yardley. 2, J. Elgar. ANY OTHER VARIETY.—1 and *c*, J. Elgar (Black Barbs). 2, H. Yardley.

JUDGE.—Mr. W. B. Tegetmeier.

HESSE POULTRY SHOW.

THIS Exhibition took place at Hesse, near Hull, on the 27th ult. The number of entries was considerably less than last year, but the general quality of the birds was much superior; some excellent specimens were shown in the Game, Hamburgish, Polish, and Bantam classes. In the Pigeon department the competition was very close, the Dragon, Carrier, Trumpeter, and "Any variety" classes were the best; in the latter White Owls took both prizes.

SPANISH.—1, G. Holmes, Driffield. 2.—Lawson, Hull. COCK.—1, G. Holmes. DOBRINGS.—1, G. Holmes. 2, J. Thompson. COCK.—1, G. Liveridge, Cottingham. COCHIN-CHINA.—1, H. Lawson. COCK.—1, G. Liveridge. GAME.—Black-breasted or other Reds.—1, H. M. Julian. 2, G. Holmes. COCK.—1, H. M. Julian. ANY OTHER VARIETY.—1, H. M. Julian. POLANDS.—1 and 2, Mrs. Proctor, COCK.—1, Mrs. Proctor. HAMBURGS.—Golden-spangled.—1, G. Holmes. COCK.—1, G. Holmes. Gold-pencilled.—1, G. Holmes. 2, G. Purdon, Driffield. D. White, Driffield. Silver-spangled.—1, G. Holmes. 2.—Willerton, Hesse. COCK.—1.—Willerton. Silver-pencilled.—1, G. Holmes. 2, R. Robson Beetonville. COCK.—1, G. Holmes. BANTAMS.—Game.—1, J. Dugdale, Driffield. 2, W. Adams, Ipswich. COCK.—1, J. Dugdale. ANY OTHER VARIETY.—1, T. C. Harrison, Hull. 2, Miss E. Harrison, Hull. 3, G. Hurry, Hull. ANY OTHER VARIETY.—1, G. L. H. Beverley. 2, R. Loft, Woodmansay. SELLING CLASS.—1.—Purdon. 2, W. Hardy, Hesse. DUCKS.—Aylesbury.—1, D. Merkin, Driffield. 2, O. A. Young, Driffield. Rouen.—1, D. Merkin. 2, O. A. Young. Common.—1, O. A. Young.

PIGEONS.

DRAGONS.—1, W. H. Adams, Beverley. 2, H. Lawson. POTTERS.—1, P. Hague, Hull. 2, T. Statters, Hull. CARRIERS.—1, W. Canupey, Beverley. 2, T. Thompson, Hull. TRUMPETERS.—1, T. Statters. 2, C. Lythe, Cottingham. JACOBS.—1, C. Lythe. 2, G. C. Davis, Hull. FANTAILS.—1, H. Adams. 2, H. Lawson. TUMBLERS.—1, H. Adams. 2, C. Lythe. BARBS.—1, T. Statters. 2, T. Thompson. NENKS.—1, C. Lythe. 2, H. Adams. ANY OTHER VARIETY.—1, Mrs. Proctor. 2, H. Adams.

JUDGES.—Mr. J. Hodgkinson, and Mr. D. Pickering, Hull.

CLECKHEATON POULTRY SHOW.

THIS was held on the 30th ult., when the following prizes were awarded by the Judges, Mr. James Dixon, of Bradford, and Mr. R. Teclay, of Fulwood, Preston:—

GAME.—Black or Brown Red.—1, E. Aykroyd, Eccleshill. 2, T. Bottomley, Shelf. *hc*, J. W. Thompson, Southwark. Duckwing, Blue or Green.—1, E. Aykroyd. 2, H. C. & W. J. Mason, Drighlington. ANY VARIETY.—1, H. C. & W.

J. Mason. 2, R. & H. Walker, Gomersal. DOBRINGS.—1, T. Briden, Early. 2, W. H. King, Rochdale. COCHIN-CHINA.—Cinnamon or Buff.—1, H. Beldon, Bingley. ANY VARIETY.—1, J. White, Netherton. 2, H. Beldon. SPANISH.—1, H. Beldon. 2, J. Powell, Bradford. BRAHMA POOTRA.—1, H. Leacy, Hebden Bridge. 2, E. Leech, Rochdale. *hc*, W. Whiteley, Sheffield. HAMBURGS.—Golden-pencilled.—1, H. Beldon. 2, S. Smith, Northwram. Duck.—1, H. Beldon. 2, H. W. Hilmworth, Idle. Golden-spangled.—1, H. Beldon. Silver-spangled.—1 and 2, H. Beldon. BANTAMS.—Game, Black or Red.—1 and *hc*, W. F. Entwistle, Cleckheaton. 2, G. Noble, Staincliffe. Game, any Variety.—1 and 2, W. F. Entwistle. ANY OTHER VARIETY.—1, J. Walker, Halifax. 2, H. Beldon. *hc*, S. Rhodes, Wike. ANY OTHER VARIETY.—1 and 2, H. Beldon. TURKEYS.—1, E. Leech. 2, W. Stocks, Cleckheaton. *hc*, S. E. England, Silsden. GESE (Any variety).—1, E. Leech. 2, J. White, Netherton. 3, H. Crossley, Halifax. DECKS.—Aylesbury.—1, E. Leech. Rouen.—1, E. Leech. 2, J. White. ANY OTHER VARIETY.—1, T. C. Harrison, Hull. 2, J. Woodcock, Cleckheaton.

PIGEONS.

TUMBLERS.—1, J. Hawley, Bingley. 2, H. Yardley, Birmingham. CARRIERS.—1, W. H. Mitchell, Moseley. 2, H. Yardley, *hc*, S. Smith, Idle. POTTERS OR CROPPERS.—1 and 2, J. Hawley. FANTAILS.—1, F. Graham, Birkenhead. 2, H. Yardley. DRAGONS.—1, W. H. Mitchell. 2, S. Smith. 3, T. Kaye, Hoxley, *hc*, H. Yardley. JACOBS.—1 and 2, J. Hawley. NENKS.—1, F. Graham. P. Birdwell, Astbury. 3, B. Peck, Birkshaw. 4, J. Oldroyd, *hc*, J. Hawley; C. Arton, York. ANY OTHER VARIETY.—1, C. Arton. 2, J. Hawley.

RABBITS.—Lops and L.—1, R. Thornton, Gomersal. 2, W. Crowther, Gomersal. ANY VARIETY.—1, K. Thornton. 2, J. Birky, Cleckheaton.

DRIFFIELD POULTRY SHOW.

THIS year's meeting of the Driffield Society was a most satisfactory one as regards both the receipts at the entrance gates and the number of pens exhibited. Many very excellent birds were shown in the deepest moult, which was a considerable drawback to the general effect. The poultry were placed entirely in the open air, but as the day was exceedingly fine no evil consequences ensued to delicate varieties. Game fowls throughout were exceedingly fine, but the Hamburgs, with the exception of very few pens, were most defective. Geese and Turkeys were first-rate, and the entry of fancy Ducks was a really good one; but the display of both Aylesbury and Rouen Ducks was so very limited that there was no competition for the second prizes. Pigeons in most instances were both good and attractive, and a few remarkably good Rabbits were shown.

DOBRINGS.—1, G. Holmes, Driffield. 2, W. Charter, Driffield. *hc*, R. W. Richardson, Beverley. Chickens.—1, R. W. Richardson. *hc*, W. English, Pickering. *c*, Miss Jordan, Eastburn; T. H. Trig. COCK.—1, J. A. Blanchard, 2, P. White, Driffield. SPANISH.—1, G. Holmes. 2, J. Williamson, Driffield. *hc*, W. Charter, T. H. Trig. 3, G. M. Maynard, Driffield. *hc*, G. Holmes, W. Charter. *c*, R. Stabler, Driffield; W. English, Gomersal. Black-breasted and other Reds.—1, H. Holmes. 2, W. Boyes, Beverley. *hc*, J. W. Lacey, Driffield (2); W. Boyes. COCK.—1, W. Boyes. *hc*, G. Holmes. ANY OTHER VARIETY.—1, 2, and Silver Medal for the best pen of poultry of any kind exhibited, W. Boyes. COCK.—1, W. Boyes. Chickens.—1, W. Boyes. *c*, F. Parkinson, Market Weighton; J. W. Lacey; W. English. COCHIN-CHINA.—1, E. Dawson, Beverley. 2, T. S. Turner, Barrobridge. *c*, G. Holmes. Chickens.—1, W. J. Purdon, Driffield. *hc*, W. Charter, T. H. Trig. 3, E. Dawson. POLANDS.—1 and 2, T. S. Turner. *c*, W. English. HAMBURGS.—Golden-spangled.—1, G. Holmes. 2, H. Holmes. *hc*, D. Maynard. COCK.—1, T. Holmes. *hc*, H. Holmes. Silver-spangled.—1, H. Holmes. 2, Withheld. COCK.—1, H. Holmes. Golden-pencilled.—1, H. Holmes. 2, W. J. Purdon. COCK.—1, D. Stabler. *hc*, E. Wilson, Norton, Malton. Silver-spangled.—1, T. Holmes. 2, R. Wilson. *c*, H. Holmes. COCK.—1, H. Holmes. Adams, Ipswich. 2, A. Dugdale, Driffield. *hc*, W. Mecke, Driffield. *c*, J. Stabler; E. Hutchinson; T. Holmes; H. Smith, Peacably, Norton, Malton. COCK.—1, T. Holmes. *hc*, F. Pickering; E. Stabler; G. H. Pickering. ANY OTHER VARIETY.—1 and 2, T. C. Harrison, Hull (Black and Gold-faced). *hc*, T. Holmes (White). COCK.—1, T. C. Harrison. GESE.—1, O. A. Young. 2, G. Smitson, Driffield. BUSHES.—1, Mrs. W. Mosey, Skerne. 2, Mrs. Troff, Birkham. Turkeys.—1, P. C. Matthews, Birkham. 2, W. Charter, *hc*, G. M. A. Ulroft, Middleton Green. *c*, L. Danks, Great Back; Mrs. Drakton, Frodingham. GUSIA FOWLS.—1, O. A. Young, Driffield. DECKS.—Aylesbury.—1, O. A. Young. 2, no competition. Ducklings.—1, O. A. Young. 2, no competition. Rouen.—1, O. A. Young. 2, no competition. Ducklings.—1, Miss Jordan. *hc*, O. A. Young. ANY OTHER VARIETY.—1 and 2, T. C. Harrison (Pintails and Caroubast). Ducklings.—1, O. A. Young. *c*, Mrs. T. B. Dalby, Everingham; Miss Jordan.

PIGEONS.

POTTERS.—1, W. Adams, Ipswich. *hc*, E. Waites, Driffield. *c*, B. W. Hutton, Cranwick. CARRIERS.—1, W. Canupey, Beverley. *hc*, R. P. Moon, York. *c*, C. Potter, Driffield. JACOBS.—1, E. C. Davis, Hull. *c*, R. Sanders, Leven. FANTAILS.—1, W. Adams, Ipswich. *c*, R. P. Moon, York. TUMBLERS.—1, W. Adams. *hc*, J. Gilbert, Wetwang. BARBS.—1, A. Waites. *hc*, D. Maynard. NENKS.—1, W. Adams. *c*, R. P. Moon. ANY OTHER VARIETY.—1, W. Adams. *hc*, B. Leason. *c*, J. Stabler; H. Watson; W. J. Purdon. EXTRA.—Extra prize Mrs. J. Purdon (Creve-Coeurs).

RABBITS.—Any Breed.—1, A. M. Donkin. 2, J. Hudson, Leven. *hc*, E. Green; P. Ashton.

Mr. Edward Hewitt, of Sparkbrook, near Birmingham, was the Judge.

LIGURIAN QUEENS IN JERSEY, AND THE HONEY SEASON.

A CORRESPONDENT has lately related his misfortunes with an Italian queen. Two very similar cases have come under my own notice. Last autumn I procured three fine queens. One I put at the head of a hybridised stock in my own possession, she is now alive and well. A second I placed at the head of a strong black colony belonging to a friend, it was well provisioned for the winter; the queen was received well, and at once began to breed. In April, when I saw them, they seemed to be doing moderately well; the queen was breeding, and very few black bees were to be seen. I next saw them in June; the

queen was then not to be seen, neither was there any brood, and very few bees, but plenty of honey. The majority of the bees had dispersed themselves amongst the adjoining hives. This stock was lost. The third queen was placed at the head of a strong colony that had been strengthened by the addition of a stock of driven bees. These belonged to another friend. The queen was accepted, and began to breed, but during the winter I heard there was more mortality amongst the Ligurians than should have been. In April I opened the hive, and found only the queen and about two hundred Ligurians, a little brood, and plenty of honey. The next day the queen was found dead, and scarcely a bee left.

What could have been the cause of these two stocks thus dwindling to nothing? It puzzles me. Was it because the black and Ligurian bees could not agree? Was it a freak of the bees? Other correspondents have spoken of the honey season being very favourable, I wish I could say the same. My supers are not filled, nor are they likely to be. A Woodbury hive is almost entirely combed, but I do not think the bees have deposited more than 2 lbs. of honey. Two stocks in Woodbury hives weigh only 16 lbs. each, exclusive of the hive, yet they have both been strong all the summer. So far as I can judge, the honey season set in and lasted but a very short time, and then ceased quite suddenly. At one time there was every prospect of an excellent honey harvest. Last year was much better here. I had a Ligurian stock which threw three swarms, and yet by the autumn it was strong and well provisioned. Very dry seasons, contrary to general experience, would appear to be unfavourable; here, as in 1868, stocks grew lighter after the middle of June. Swarms, too, have been scarce here this season.—D. D. D.

[We cannot tell why your friends' ligurianised stocks dwindled in so remarkable a manner, but it certainly did not arise from any disagreement between the two races.]

THE HONEY SEASON IN WEST SUFFOLK.

To some of your readers an account of the honey season in this neighbourhood may be interesting. Though of very short continuance, the season has not been altogether an unfavourable one. It commenced on May 16th, on the morning of which day my stock hives averaged less than in the middle of April; between this and the 23rd, however, they commenced in earnest, two of my hives increasing in weight 14 lbs. each, two 13½ lbs. each, and the worst and smallest of all making 5 lbs. They continued doing well till June 21st, which day I consider the termination of the season, as they actually lost weight between the 21st and July 5th, since which they have slightly improved. Facts speak volumes. I give you the weights of two united swarms; it will be seen that 5 lbs. were made by one hive in one day.

Swarmed June 6th, hive and board 13 lbs.

	lbs.		lbs.
June 7	21	June 12	39½
" 9	35	" 13	35½
" 10	25	" 14	39½
" 11	27½		

Swarmed June 13th, hive and board 13 lbs.

	lbs.		lbs.
June 14	22	June 29	33½
" 15	24	July 1	33
" 17	26½	" 3	32½
" 18	27	" 5	32½
" 19	31½	" 8	35
" 20	31½	" 14	37½
" 21	33½	" 17	38
" 26	34		

My spring balance only weighing 40 lbs., I have not been able to weigh them since.

From one of Pettitt's single-box hives I have obtained 11 lbs. nett of virgin honey, and estimate what is now in the hive at 9 lbs., in addition to two excellent swarms. From one of his ten-frame bar-hives I have had one swarm, 23½ lbs. nett, a splendid super, and taken four bars for draining 23 lbs. nett.

I will not tire you with more at present, but if you think it will be interesting, I shall be pleased to give you an account of all my hives, the average and performance of the whole, bad as well as good.

I should be pleased to know the average of "SUDBURY'S" hives, "all told," and whether, which is not the case with mine, the bar honey will bear comparison with that from supers. Perhaps "RECTOR" will favour us in like manner,

and also give us the weight, when taken, of his gigantic super whether it was entirely free from brood, &c.

I have no doubt, also, that you would be conferring a favour on many readers of "our Journal," if you would, now the season is approaching its close, give us your advice as to the best method of disposing of our superfluous honey, the prices of different qualities, the best markets, &c. Why should we not know the market price of honey as well as of vegetables, &c.? —UITENHAGE.

TAKING HONEY AND INTRODUCING A LIGURIAN QUEEN.

I HAVE a very large and heavy stock of bees from which I want to take the honey, but without destroying the bees, and at the same time I wish to introduce a Ligurian queen in the following manner—viz., I would remove the stock to some distance in the middle of a fine day, and place the Ligurian queen, in a hive partially filled with comb, on the stance lately occupied by the full hive. Would the bees leaving the old stock and naturally going back to their old situation (the now empty hive and Ligurian queen) be likely to agree and make up a tolerably good stock?

[All the old bees would probably return to their accustomed stance, and being old bees would almost to a certainty destroy the Italian queen. The plan which offers the best chance of success would be to fumigate the colony, search for and remove their queen, and when the stupefied bees begin to recover bury the stranger queen in the heap, and permit the whole to ascend together into their new habitation, which should be put on the old stance, and the bees fed liberally by means of an inverted pickle-bottle filled regularly every evening until they attain a nett weight of about 20 lbs.]

FERTILISATION OF THE QUEEN BEE.

In your number of the 26th of May last, in a communication on the above subject by Mr. Fitzwilkins, allusion is made to the experiments of Mrs. Tupper to procure fertilisation within the hive. As I am entirely ignorant of these experiments, or of Mrs. Tupper's publication of them, will you kindly say where the information can be obtained? as the subject is one of the highest importance to all interested in apiarian pursuits. Until the statement of this theory in the Journal, I was under the impression that fertilisation always took place in the open air, and on the wing.

Supposing the above theory correct, if a second swarm of Ligurians, issuing ten days after a first swarm, be placed in an apiary surrounded by stocks of English bees, would it not amount to a certainty that the Ligurian queen would be fertilised by English drones, as I notice drones frequently enter other hives than their own? I am putting an actual case, in which the Ligurian swarm was taken from a pure Ligurian apiary, to which there were no English bees nearer than one mile, and shall esteem your opinion a favour as to whether the queen in question may be expected to breed pure Ligurians or hybrids, there being no Ligurian drones, as far as I could ascertain, with the swarm, which was removed on the day it issued.—G. RAYNOR, Tonbridge.

[Mrs. Tupper's process was fully described in our number published on the 28th April last, but so far as we know no one in this country has succeeded with it. We should expect the queen to be hybridised under the circumstances which you describe.]

OUR LETTER BOX.

GOLDEN-PENCILLED HAMBURGHS (W. S. D.).—Congratulate yourself on the tails of your Golden-pencilled Hamburg pullets; they will remain as perfect as ever in their markings, the only difference being they will become more distinct. The cockerels will not be in full feather till next November, and even then there are feathers remaining that to the practised eye speak of adolescence. They are, however, perfectly fit to show. If the legs of Pencilled Hamburgs are dirty they must be washed; the leaden-blue of the legs helps much in producing the ensemble that is so attractive. If the face is dirty it may be washed in cold water with a little vinegar in it, but the deaf ear must not be touched. This year's chickens do not really munt until next year, but they change their feathers little by little without becoming naked as they attain virility.

BRAHMA COCK'S MARKINGS (Carrier).—It is more than desirable to have the tail of a Brahma cock of a buff or fawn colour entirely. Failing that, it should be black, but if some of them are white-tipped or curled, it is not a disqualification, especially in an old bird. In fowls, as in

human beings, perfection is the exception. So far from a black breast being essential to a Brahma cock, many of our best amateurs prefer one spotted with white. We do not admire the description you give of the Brahma hen you have bred. With a brown colour and a black head, we should unhesitatingly class her among those which are inferior to the Grey or Pencilled birds.

JUNCOES' AWARDS (*Querist*).—We are very happy to give all the information in our power to those who use our columns, but we have no means of knowing the reasons that guide judges in their awards, or in withholding prizes. We should not dream of asking them.

BONE DUST—POLAND NOT LAYING (*Mrs. Bain*).—See Mr. Lingwood's advertisement in this Journal. It is very possible for a substance to be quite innocent when given regularly in small quantities, which would be very injurious when eaten suddenly in excess; but Mr. Wright only recommends the bone dust for large breeds. Possibly the Poland is too fat. As she appears well it will be best to leave her till after moulting, unless you like to try the effect of a spoonful of castor oil. It is not, however, always possible to tell the reason a hen stops laying. We have a Brahma which has stopped in the same way. Having no cock in company would not cause it. It is possible the bird lays, but eats her eggs.

PARROT BREATHING WITH DIFFICULTY (*A Constant Reader*).—We conclude from your statement that your Parrot has caught cold and is moulting; if so, keep it out of draughts, place a pan of water in the cage for it to bathe in, and give it bread soaked in cold water, squeezed rather dry, and occasionally soaked in milk for a change; Canary, millet, and hemp seed mixed, very little of the latter; Indian corn boiled; also a Chili or white peppercorn occasionally, and any ripe fruit you find it will eat; but if the bird pull out or bite off its feathers, then give it a good washing with water twice a day through a fine-sieved watering pot, and do not give it any Chillies, peppercorns, nor hempseed. You should notice what your birds like best, for what one Parrot is fond of another often will not touch.

LICE ON CANARY (*J. S. B., and Forest Hill*).—There is an insect-destroying powder sold by most druggists under the name of Persian vermin destroyer, or some similar title, which I have known to be very effectual in eradicating these pests. It is sold with a distributor, an indian rubber ball and tube, with directions for use, and is not expensive. Any respectable druggist will supply the right article, if I should have been somewhat incorrect in naming it. If the bird were mine I should wash it, but that is an operation I should scarcely recommend an inexperienced person to attempt, and especially so near the moulting season. A thorough ansting with sulphur will materially assist in dislodging the Acari.—W. A. BLAKSTON.

CANARIES NOT PAIRING (*F. W. Herbert*).—Are you quite sure that the necessary conditions for pairing are present? "Not to put too fine a point on it," are they cock and hen? Such mistakes will sometimes occur. It may be disappointing to persons who have only one pair of birds up, to find that they show no signs of pairing; but to those who breed on a larger scale it is only one of the many failures which are written on the debit side of the account. If the birds are in health there is no reason why they should not have paired, if fed even on the plainest diet. It is usual to give a little hard-boiled egg and hempseed as a stimulant. Try it, and induce them to make hay while the sun shines, as the season is nearly over. The German method of preparing birdlime is by pulling about 2 lbs. of linseed oil into a pot, to simmer upon the fire for some time, after which it is taken off and lighted with a match. In this state of inflammation it continues about two hours, when half the quantity will be consumed. By dipping, from time to time, a stick into the oil, and trying the matter between the fingers, its proper glutinous consistence may be easily ascertained, on which the pot is covered and the flame extinguished.—W. A. BLAKSTON.

COMMENCING BEE-KEEPING (*J. G. T.*).—The pamphlet which you mention is still in print, and can be obtained through any bookseller for one shilling. The common straw hive is the one most easily managed by a beginner, but it affords no facilities for improvement.

DEFICIENT HONEY HARVEST (*Horseshoe*).—Your bees have done quite as much as could fairly be expected from them, for you may rely upon it that Mr. Pagden's golden promises can only be realised (if at all) under the most exceptionally favourable circumstances. A strong swarm may fill a super the same year if the honey season be sufficiently prolonged, but it cannot be expected to do so when it issues so late as the beginning of July. As a rule, a stock that has swarmed will not afterwards fill a super during the same season, anything that Mr. Pagden may say to the contrary notwithstanding. Your friend's bees may have been hybridised by Ligurians, but are certainly not "half wasps," unless, indeed, they are defunct, and the Vespidæ and robber bees are ransacking their hive.

SOWING LUCERNE (*B. B.*).—There is much difference of opinion about the quantity of seed required per acre, but the universal practice seems to be to sow it in drills from 14 to 18 inches apart. Assuming the ground to have been ploughed neatly and straight, we have seen the seed sown in the alternate furrow slices before harrowing down, and in the case of a small quantity, as an acre or so, sowing may be done by hand or by some light drill. If you sow by hand, putting the seed into a common bottle with a suitable-sized hole in the cork, is as convenient a way as any. About March or early in April is the best season for sowing, and the ground ought to be kept clear of weeds for a time; after the plant has been once established it is capable of taking care of itself. Nevertheless, it is good practice to slightly dig over the ground in April, and harrow it to destroy the grass and other weeds which often grow amongst the Lucerne, taking care in digging to use only a pruned fork for the purpose. Lucerne likes a deep soil or one with a subsoil which permits of its roots descending, which they do to a great depth.

MUSHROOM CATSUP (*C. N. B., Dublin*).—We give you three modes:—1. Take 4 lbs. of mushrooms, and the same of common salt; sprinkle the salt over the mushrooms, and when the juice is drawn out add 8 ozs. of pimento and 1 oz. of cloves. Boil these for a short time, and press out the liquor: that which remains may be treated again with salt and water for an inferior kind. (2). Take the large flaps of mushrooms gathered when dry, and bruise them; put some at the bottom of an earthen pan, and strew salt over them; then put on another layer of mushrooms, then

salt, and so on till you have sufficient. Let them stand a day or two, stirring them every day; strain the liquor through a flannel bag, and to every gallon of liquor add one quart of red wine; mace, cloves, allspice, of each ½ oz., with a race or two of cut ginger. If not salt enough, add a little more. Boil it till one quart is wasted, strain it into a pan, and let it get cold. Pour it from the settlings, bottle it, and cork it tightly. (3). Take care that the mushrooms are of the right sort, and fresh gathered. Full-grown flaps are the best. Put a layer of these at the bottom of a deep earthen pan, and sprinkle them with salt; then add another layer of mushrooms, with more salt, and so on alternately. Let them remain two or three hours, by which time the salt will have penetrated the mushrooms, and rendered them easy to break; then pound them in a mortar, or mash them well with your hands, and let them remain two days, during which stir them up and mash them well; then pour them into a stone jar, and to every quart put 1 oz. of whole black pepper; stop the jar closely, set it in a stewpanful of boiling water, and keep it boiling two hours. On taking out the jar pour the juice clear from the sediment through a hair sieve into a clean stewpan, and let it boil gently half an hour; skim it well, and pour it into a clean jar or jug; cover it closely, let it stand in a cool place till the next day, then decant it off as gently as possible through a tamis or thick flannel bag till it is perfectly fine, and add a table-spoonful of good brandy to each pint. Now let it stand again, when a fresh sediment will be deposited, from which the catsup must be gently poured off into bottles which have been previously washed with brandy or other ardent spirit. Kept closely corked and in a cool place it will remain good a long time. Examine it, however, occasionally by placing a strong light behind the neck of the bottle, and if any skin appears upon it boil it up again with a few peppercorns. This is called double catsup, and a table-spoonful of it will impart the full flavour of Mushroom to half a pint of sauce.

METEOROLOGICAL OBSERVATIONS

In the Suburbs of London for the week ending August 2nd.

Table with columns: DATE, BAROMETER (Max, Min), THERMOMETER (Air: Max, Min, 1 ft, 2 ft), Wind, Rain. Data for Wed., Thurs., Fri., Sat., Sun., Mon., Tues., and Mean values.

- 27.—Fine; cloudy but fine; clear and fine.
28.—Densely overcast; overcast; clear, starlight.
29.—Cloudy but fine; densely overcast; overcast.
30.—Densely overcast; overcast; mild, overcast.
31.—Densely overcast; thunder; overcast.
1.—Densely overcast, damp; cloudy, thunder; foggy.
2.—Foggy, drizzling rain; foggy and overcast; densely overcast.

COVENT GARDEN MARKET.—AUGUST 3.

We have scarcely any alteration worth quoting. The supply of out door produce is well kept up, and a good attendance of buyers enables the growers to clear a large quantity of goods. The last cargo of West India Pines is now in the market. Foreign importations continue heavy, and include some very considerable consignments of Apples from the south of Spain, which are, however, of very poor quality. Good Regents are more plentiful this week among the Potato dealers.

FRUIT.

Table listing fruit prices: Apples, Cherries, Chestnuts, Currants, Figs, Filberts, Grapes, Lemons, Melons, Mulberries, Nectarines, Oranges, Peaches, Pears, Pine Apples, Plums, Quinces, Raspberries, Strawberries, Walnuts.

VEGETABLES.

Table listing vegetable prices: Artichokes, Asparagus, Beans, Brood, Broccoli, Brussels Sprouts, Cabbage, Capsicums, Carrots, Cauliflower, Celery, Coleworts, Cucumbers, Endive, Fennel, Garlic, Herbs, Horseradish, Leeks, Lettuce, Mushrooms, Mustard & Cress, Onions, Parsley, Parsnips, Peas, Potatoes, Radishes, Rhubarb, Savoy, Sea-kale, Shallots, Spinach, Tomatoes, Turnips, Vegetable Marrows.

From observations taken near London during the last forty-three years, the average day temperature of the week is 73.9°, and its night temperature 50.5°. The greatest heat was 92°, on the 11th, 1835; and the lowest cold 33°, on the 11th, 1864. The greatest fall of rain was 1.14 inch.

THE BLACK CURRANT.

Of all the kinds of bush fruit grown for the markets, the Black Currant is undoubtedly the most profitable. Its easy cultivation, the vigour with which it grows in almost all soils, and its great fruitfulness are all points in its favour. It flourishes in the cold Wealden clay, in which but few other fruit trees will thrive, and it is considered poor soil indeed in which the Black Currant will not grow; nor is its crop so much affected by being shaded during its growth as that of other fruits would be, for most flourishing plantations of it may be seen growing around and under standard trees.

But while all this may be said in its favour, it must also be granted that it is a gross-feeding plant, increasing in vigour in proportion to the quality of the soil, and it will well repay the fruit-grower for all the manure he can bestow upon it. Some little care is, however, necessary in regard to the way in which manure is applied: no practice can possibly be worse than to dig in manure in the way in which it is sometimes done, the fork going into the ground so deeply as to tear off quantities of the young roots, thus doing more harm than good. This deep culture may answer very well when the plants are young, but as they attain a larger size, and the roots gradually spread farther and farther, manure is best given as a top-dressing or in a liquid state.

In propagating the Black Currant it is a common practice to leave a clear stem of nearly a foot in length; now this is not only unnecessary, but is altogether a mistake, as it is impossible for such trees with their long stems to continue to produce such fine fruit as others, the branches of which spring from the ground erect and strong, and whose vigour and size is constantly increased by the sturdy suckers springing up and taking the place of the older wood.

As an example of what can be done with such bushes, I may instance two fine rows of Black Currants growing in the gardens of the Earl of Romney. These bushes are upwards of twenty years old; they were planted 6 feet apart, but have grown with such vigour that notwithstanding the freedom with which they have constantly been pruned, they are now 5 feet high, and the side branches of every tree touch those of its neighbour. Nothing can exceed the robust appearance of these splendid bushes. The soil about their roots has not been disturbed for some years past, with the exception of being deeply hoed on the surface a few times in summer, in order to work in the annual top-dressing of hotbed manure. In favourable seasons the fruit crop averages four gallons on each bush: this year it will not be so good, as the crop has suffered from the late spring frosts.

The sight of these large bushes, which from the vigour of their young growth appear likely to flourish for twenty years longer, and the large crops of fine fruit which they produce, are enough to set one thinking; and after making a calculation of the value of their produce at the rate of

4*l.* per quart, as given by "A LANCASHIRE SUBSCRIBER," in No. 470 of this Journal, so enormous is the total, and so much in excess of what it is customary to speak of, that one hardly likes to put it on paper. However, here are my facts, and I would ask all growers of fruit for profit to give them the notice they deserve. An acre of such trees planted 6 feet apart will contain 1210 plants, and taking the crop at 4 gallons or 16 quarts per bush, at 4*l.* per quart, we have the astounding sum of £322 13*s.* 4*d.* per acre. Now, I do not pretend to say that an acre of Black Currants has ever produced such a crop, but here we have forty-two bushes growing side by side, the yield of which has been up to this average in every favourable season for some time past, and therefore there can be no reason why an acre, or many acres, of such trees should not be capable of producing some such desirable results.

And this leads to the inquiry, Why is it that such fine Black Currant trees are not more frequently to be met with? It may be that the answer is contained in the fact that the hardy and accommodating nature of the Black Currant causes it generally to be planted in poor soil and in an equally bad situation, and so it is very rarely indeed that the requisite conditions are afforded to enable it to attain its fullest development.

Now these conditions are few, simple, and easily understood. Large juicy fruit always commands the best sale. Such fruit is only produced on the young vigorous growth of the preceding year; it must, therefore, be our aim to obtain an abundance of such wood by planting in a deep rich loam, by manuring freely, and by cutting away the old and thinning the young wood, so as to admit air and light. Such being the case, it must be admitted, that while no fruit tree is so useful as the Black Currant for planting in poor soil, yet none thrives better or yields such rich returns when enjoying the advantages of a good soil and generous treatment.—EDWARD LUCKHURST, *Figerton House Gardens, Kent.*

SELECT GARDEN ROSES.

DOUBTLESS as the autumn comes on there will be many inquiries for the best varieties of Roses for planting. In anticipation of these, I have made out a list which I think will not fail to please those who may select from it. The selection is taken from a large collection of Roses growing here, and I offer it with a view more particularly to suit those who contemplate making new plantations, or a rosery, and where the soil does not approach that standard of fertility generally recommended and required for the cultivation of the more delicate kinds of Roses. I have, therefore, excluded most of the latter, because, from experience, I consider it useless to plant anything but Roses of vigorous growth and constitution, unless the soil and situation be very suitable.

The site of the Rose garden at this place is good, being well sheltered from the north and east, but it is laid well open to the south and west; the soil, however, was very poor, a hungry-looking clayey loam, but now that it is well drained and enriched with manure it grows Roses well:

still for some years the delicate-growing sorts did not thrive. The frequent trenchings that the soil had to undergo in order to enrich it, and consequently the lifting of the plants, was a treatment too severe for any but the vigorous and robust-growing sorts; these, however, have thriven very well, and are included in the list below. I believe them to be a selection of generally useful varieties, and many of them exhibition Roses. Those with an asterisk I consider the best.

HYBRID PERPETUAL.—*Prince de Portia, vermilion; Mademoiselle Alice Leroy, pale rose; Madame de Cambacérés, rose; Duchess of Sutherland, rose; Alba carnea, white; Jules Margottin, cherry; *Comtesse de Turenne, pink; Duchess of Norfolk, crimson; *John Hopper, rose; Madame Clémence Joigneaux, red; *Jean Goujon, red; *Beauty of Waltham, cherry; *Baronne Prevost, rose; *Elizabeth Vigneron, pink; *Sir Rowland Hill, crimson; *Monsieur de Montigny, rose; *Rev. H. H. Dombain, carmine; *Géant des Batailles; Jean Rosenkrantz, red; *Paul Verdier, crimson; *Madame Boll, rose; La Reine, pink; *Madame Charles Wood, crimson; Triomphe de Caen, dark crimson; Duchesse d'Orléans, blush; *Marguerite de St. Amand, rose; Léopold Hausburg, carmine; *William Jesse, crimson; *Charles Lefebvre, crimson scarlet; *Souvenir de Comte Cavour, crimson; *Alfred Colomb, red; Miss Ingram, flesh; *Madame Alfred de Rougemont, white; Joseph Fiala, dark red; *Black Prince; Madame Fillion, salmon; Madame Moreau, bright red; Merveille d'Anjou, red; *Madame Vidot, flesh; *La Ville de St. Denis, rosy crimson; Pius IX.; Caroline de Sansal, flesh; *Pierre Notting, dark red; Charles Kouillard, rose; Madame Pulliat, dark rose; Madame Boutin, crimson; *Madame Knorr, rose; François Treuve, scarlet; *Mademoiselle Marie Rady, deep rose; *Comte Litta, scarlet; François Premier, red; *Anna de Diesbach, deep rose; *Auguste Mie, pink; *Le Géant, rose; Madame Rivers, flesh; *Reine du Midi; Thorin, bright rose; *Pauline Lausezeur, crimson; Antoine Ducher, bright red; Jean Lambert, red; and Prince Camille de Rohan, crimson.

HYBRID CHINESE AND BOURBON.—*Cbénédolé, crimson; *Coppe d'Hébé, pink; *Paul Ricaut, carmine; *Vivid, crimson; and Madame Plantier, white.

DAMASK.—*La Ville de Bruxelles, rose; and Madame Hardy, white.

ALBA.—Félicité (Parmentier), flesh; and *Queen of Denmark, pink.

GALLICA.—Grandisima, rose; *Boula de Nanteuil, crimson purple; Kean, purple; and Letitia, rose.

MOSS.—*Comtesse Murinais, white; Baronne de Wassebaër, red; Common Moss, and Perpetual White Moss.

TEA.—*Gloire de Dijon and *Homer.

The above sorts are suitable for growing as standards or dwarfs; being vigorous-growing they mostly succeed well worked on the Briar as standards, but the same sorts will become quite robust as dwarfs.

With regard to the planting of Roses, I may remark that the earlier in the autumn they are planted the better, especially in low damp situations; it is much the best plan to plant early and induce them to make as many roots as possible before winter sets in. Spring-planted Roses seldom do any good towards a first bloom.—THOMAS RECORD, *Lillesden*.

EARLY PEACHES IN THE NORTH.

ANOTHER season has confirmed my experience of Mr. Rivers's early Peaches. The trees were placed in the house in January; the heat was given to them on the 20th of that month, and was only enough to keep the frost fairly out. Early Beatrice ripened on the 3rd of June, Early Louise on the 7th, Early Rivers on the 10th; these were followed by Hale's Early and Rivers's White Nectarine a week later.

Early Louise was fair-sized and very good, but Early Rivers was both larger and better in flavour—in fact, I think it very nearly the best Peach I know; the flavour is so piquant that there is no fear of it ever becoming insipid from early forcing. And then with regard to earliness, it is only a few days later than the very earliest of Mr. Rivers's early varieties, a month earlier than Early York, and six weeks earlier than Early Grosse Mignonne (specimens of both these varieties standing between trees of Early Rivers), so that I feel assured it ought to be largely cultivated under glass. I find Rivers's White Nectarine to be very early, and to be one of the best in flavour under glass, and very vigorous and productive.

Midseason Peaches are so numerous that it is hardly worth while trying to get new varieties of them; but these early ones,

and also the late, show that much may still be done in both directions of earliness and lateness. At any rate, the attention of gardeners ought to be turned to these early varieties of Mr. Rivers's, for a month gained in earliness ought in every way to make them profitable.

The potted trees of these early sorts have their fruit buds fully formed for next year, are out of doors, and quite ready for having water withheld in order to set them to rest; and they might be placed in heat in November or December if early forcing were desired.—W. KINGSLEY, *South Kilvington*.

THE SALISBURY ROSES.

A VISIT to Salisbury is almost a necessary adjunct with me to one to Okeford Fitzpaine, and consequently on my return from my good friend Mr. Radclyffe's hospitable home I stopped at the old cathedral city, where Mr. Keynes was good enough to meet me, and, as my time was limited, to take me to his nurseries. Under his guidance, and that of his able and intelligent foreman Mr. Gill, I had a good opportunity of seeing his stock, and also of talking over the quality of the various new kinds introduced during the last two years.

There are some people who go to war for an idea. Here are two of the greatest of continental powers, like two big boys at school, determining to slay thousands of their fellow creatures, because one thinks and says, "I can lick you," and the other replies, "You can't; try it." But there are also some people who will not fight because of an idea. We have this year, except from the lists of the Crystal Palace, missed the vigorous onslaught of the knight of Salisbury; and yet that ought not to have been, for I never saw finer Roses than there were in the nurseries. But there was an idea that there would be no necessity for watering; and although Mr. Keynes has a river running at the bottom of his grounds, his Roses were not watered. Rain never came, although, as in most places, it threatened much to do so, and the result was that he was *hors de combat*, and the queen of flowers missed one of her doughtiest champions. But it is an "ill wind that blows nobody good," and so I had an opportunity of seeing the Roses un mutilated, and with a far larger amount of bloom than I should have done had Mr. Keynes exhibited as usual.

It is a great treat to a lover of Roses to see 30,000 all in one piece in full bloom, and in such fine condition as they were here—to see row after row of such fine flowers as Baroness Rothschild, Marie Rady, Marguerite Dombain, Louise Peyronny, Alfred Colomb, Duke of Edinburgh, and Joséphine Beauharnais. But this is an oft-told tale, and so, as a matter of greater interest, we will have a look at the new Roses, of which Mr. Keynes has a grand supply. As to those of last year, the following was the estimate we formed:—

Berthe Baron, a well-shaped Rose; pretty colour, and good. Charles Fontaine, a rich deep crimson Rose of good quality. Devienne Lamy, brilliant carmine; very large, well-shaped flowers, but will not answer on the Manetti. Dupuy Jamain, bright cherry colour. Emilie Hausburg, beautiful rose colour; an exquisitely shaped Rose. Henri Ledechaux, bright rosy carmine; very pretty. Madame Creyton, a beautifully formed Rose, and a novel colour—carmine shaded with rose. Marquise de Mortemart, blush white; very pretty, although at times inclined to be rough. Monsieur Journeaux, crimson scarlet; flowers large and full; a particularly beautiful shade of colour. Souvenir de Monsieur Poiteau, bright salmon rose, quite distinct in colour. Thyra Hammerich, a beautiful flesh-coloured Rose; a seedling from Duchess of Sutherland. Victor le Bihan, brilliant rosy carmine; flowers large and full.

It will thus be seen that a dozen Roses of last season were considered worthy of being retained; others which have been much spoken of, such as Julie Touvais, Madame Jacquier, Reine Blanche, and Clovis, were condemned. Of Tea Roses, Marie Sisley, Adrienne Christophe, and La Tulipe were considered good, the first two especially.

Of the new Roses of this year Mr. Keynes and Mr. Gill spoke very highly of Marquise de Castellane, raised by Pernet, the raiser of Baronne de Rothschild, and of Louis Van Houtte and Mdlle. Eugénie Verdier, both of which I have already noticed as fine. There are some Roses "well done" here, which one does not often see elsewhere. Joseph Fiala, Hippolyte Flandrin, an enormous Rose, not free-flowering, but at times giving Roses far larger than Louise Peyronny and more double, and Madame Moreau, are cases in point; while Maréchal Niel is in perfection here on the Briar, a stock well suited for all the Tea-scented Noisettes. There was a Rose the name of which I forgot to

get, probably Mr. Keynes can supply it; it was numbered 13, very dwarf, not growing more than a foot high, of a pretty bluish colour, and good shape.

Although Roses were my chief object, yet one could not pass by some other things which Mr. Keynes cultivates admirably. Need I say that the Salisbury Dahlias with which he first won his way to fame are as famous as the Salisbury Roses? and notwithstanding the excessive drought they were looking beautiful; while some seedlings that I saw seemed to me to be in advance of those we already have, notably a shaded purple of great beauty. But as Mr. Keynes will be a large exhibitor at the first exhibition of the new Metropolitan Society for the Encouragement of Florists' Flowers I shall have more to say of them then.

I have before now noticed the Vines at these nurseries, and again I have to express my wonder at the fine plants which fill the houses. To pick and choose from them would be simply needless, for they are all alike good; and I wish those good people who talk of Golden Champion being an indifferent grower could have seen the canes here from eye, quite as vigorous in every respect as the Black Hamburgs close by them. Of Royal Ascot, too, Mr. Keynes spoke highly, especially as a Vine for pot culture, for which its prolific character makes it admirably suited. These Vines, with their long stout canes, were not forced by stimulating manures; they were grown in nothing but leaf mould and good loam, and their appearance fully justified the treatment to which they had been subjected.

It is well known that Mr. Keynes sends out yearly some Verbenas raised by Mr. Eckford. I saw those of this season, and notwithstanding the drought they looked very well indeed. The finest as a bedder was Eclipse, but the others were also very good—Mrs. Eckford, Henry Eckford, Countess of Radnor, Miss Cole, and Sensation. The past season has tried Verbenas very much, and I fear they are gradually going out of estimation as bedding plants.

Such is a brief notice of what I saw at Salisbury. A finer stock, especially of Roses on the Manetti, I never saw; and one has only to visit such a nursery as this to see how universal is the love of the queen of flowers in these islands.—D., *Deal*.

EARLY PROLIFIC AND OTHER STRAWBERRIES.

The season for planting Strawberries having arrived, it may interest amateurs to hear something of the above splendid variety, raised from seed by that indefatigable amateur, W. Roden, Esq., of Kidderminster, and latterly made known to the public. After having admired, two years ago in Dr. Roden's garden, the fruit of his pet, he kindly sent me a few plants for trial. I increased them so as to form a nice bed of fifty plants, which had grown strong and capable of bearing a full crop the past season.

In consequence of the late cold spring my lot only began to bloom on the 10th of May, and it beautifully set its fruit, the first of which was ripe on June 15th, and the plants continued bearing for more than five weeks. To describe the beauty of this little bed in full bearing is impossible; suffice it to say that everybody who saw it was struck by the picture.

In size the fruit is rather large, of a very handsome even shape, mostly conical, sometimes flattened; its colour it is bright glossy vermilion from calyx to point; and as to quality, it is surpassed by none. The plant is of healthy growth, elegant habit, and easy propagation. I can holdly assert that the Early Prolific is the earliest of the large kinds, and it produces no fruit of inferior size. When better known it must become a general favourite, the more so as I found it very useful for early forcing in pots. Another point of recommendation is the fact that it stands the drought and heat better than most others. I am convinced that all fragarians will feel glad of my having called their attention to such a superior novelty.

Dr. Roden has another valuable seedling, the Duke of Edinburgh, a worthy companion to Early Prolific. This is a little later, but its noble fruit is larger still. Mr. Bradley's Sir Joseph Paxton, quite a gem here, is, I am sorry to see, but rarely mentioned across the Channel. It is later than the Early Prolific, but likewise a sort which will be grown as long as Strawberries are cultivated.

Of the late Dr. Nicaise's ten new seedlings, sent out last spring at exorbitant prices, I have as yet not been able to form an opinion. As far, however, as I have proved them, I believe that some of them will be useful additions to a choice collection.

Our Strawberry crop has been, generally speaking, small and of short duration. On account of the extraordinary drought and tropical heat of the present summer, the fruit of such soft kinds as Marguerite was roasted before completing its maturity. It is to be wondered that we should have had Strawberries at all.—FERDINAND GLOEDE, *Beauvais (Oise) France*.

AFTER reading Mr. Creed's paper on the Strawberry (see page 57), it has just occurred to me that a few more notes from another pen might be of service to those about to plant. My soil is a clayey loam, hard as a flint when dry, yet easily worked under certain conditions. The whole of my Strawberry beds I had trenched two spades deep, and as much manure as possible was put in. I planted the following sorts all grown under the same conditions, that is, throughout the dry weather they received no water, as I had it not to give—Rivers's Royal Hautbois, Rivers's Eliza, Dr. Hogg, President, Mr. Radclyffe, De Jonghe's Emma, Lucas, Nimrod, Stirling Castle Pine, La Constante, and Carolina Superba.

As regards the Royal Hautbois the flavour was excellent, and it bore better than I expected; I shall still grow some of this sort. Rivers's Eliza was exceedingly prolific, a good strong grower, producing some very good fruit, but this was rather surpassed by the Stirling Castle Pine in quantity, flavour, and colour, Mr. Radclyffe being equal with this variety in all these respects, but beating it in size. President was small with me and had but few fruit. Dr. Hogg did not grow well, and to my mind is not bright enough in colour. Lucas was also a shy bearer, also Nimrod, but both are good. La Constante was weakly and very small in fruit. Carolina Superba is not strong enough in constitution for my soil, and gives too small a crop. De Jonghe's Emma was very fine in flavour and colour, a free bearer, and certainly worth growing. After taking all qualities into consideration, for my stiff soil I have decided that Mr. Radclyffe and Stirling Castle Pine are my best two, very closely followed by Rivers's Eliza and De Jonghe's Emma; for I hold that one wants quantity as well as quality, and I also like a good bright-looking Strawberry, something that appeals to the palate through the eye. Lucas and President, also Dr. Hogg, I shall grow, but if they do not serve me better another year I shall discard them. I have only a dozen of President, and I shall not increase my stock. La Constante and Carolina Superba I shall dig in most of at once, on account of their weakly growth. Nimrod I shall try another year, but I think most likely I shall reduce my varieties to Mr. Radclyffe, Stirling Castle Pine, and De Jonghe's Emma, if the last go on as well as it has begun. I may here remark that I can do nothing with the British Queen in my soil, and also I may say that amongst all the foregoing sorts I do not think I had a dozen barren plants, which seem to have been so common with Mr. Creed.—HARRISON WEIR, *Weirleigh, Kent*.

IMPERIAL BLUE PANSY, EAST LOTHIAN STOCKS, AND BETA CICLA CHILENSIS.

PERHAPS one of the greatest acquisitions which has gladdened the hearts of bedders out lately is Imperial Blue Pansy. We may write it down as first-rate as surely as Golden Pyrethrum. The colour, a beautiful deep lavender blue, is all that can be wished for, and it is one that was much needed. The blooms seem to retain their depth of hue to the end—at least, there is no symptom of change as I write now, on August 4th. With attention to taking off decaying blossoms and pretty constant top-dressing, this Pansy remains vigorous in constitution and a mass of bloom all summer. What would be the best edging for it? I have Golden Pyrethrum, but it is too pale. Something more orange would be better. I am inclined to think its best companion would be Duke of Edinburgh bronze zonal Pelargonium.

The next plant I wish to express my gratitude to is the crimson East Lothian Stock. Here, again, we have a colour, which in the north of Ireland we have always found it most difficult to obtain in a mass. The uniform habit of the growth of this Stock, its durability, and the large proportion of plants bearing double flowers, entitle it to a very high place indeed. Golden Eagle Pansy would make a beautiful border for it.

Beta Cicla chilensis is a very beautiful and striking plant. It would be a magnificent border for a shrubbery, or a large bed of Dahlias or Rhododendrons. The stems, which are very broad, are most brilliantly coloured—scarlet, orange, yellow, magenta, rose, and white. It would, I think, be very handsome

in vases on a terrace, or as a pot plant for hall decoration. All who have large gardens and extensive grounds should try it next season.—Q. Q.

THE POTATO CROP.

This season has been a very peculiar one for the Potato crop in this neighbourhood (Hawkhurst); the severe drought caused a premature ripening of the tubers, especially in the second early, general, and late crops. Here we had no rain to speak of for fully four months, but last week heavy showers fell, which improved the condition of everything except the Potatoes. These are growing and supertuberating at an alarming rate. Acting upon the experience gained the year before last, when the Potatoes I left in the ground proved worthless for eating after having grown again, I have now decided on taking up all those sorts that have tubers of an average size, for, although the crop is small, I feel convinced that it is better to secure what I have than to run the risk of spoiling the present crop for the uncertain chance of obtaining a better one. I would advise others whose Potatoes are going in a similar way to take them up, because I acted on the same plan last year and the year before and did well.

But, perhaps, some will say that such Potatoes, if taken up, will not keep well. I admit that sometimes they will not keep so well as a fully-ripened Potato, but if a little additional care be bestowed upon them there will not be much to complain of in that respect. I say, Do not be in a hurry to finally store them, but do all that is possible to encourage ripening by keeping them spread thinly in a dry airy shed, from which strong light is excluded; then their tendency to grow will be checked, ripening will go on, and when they are finally stored in heaps they will not be so likely to heat or sweat, which would be sure to induce decay. My opinion is, that all Potatoes should be planted early; even the late sorts should be planted early or very late indeed. My plan is to plant for early crops as soon after January as the state of the soil will allow, but I like to have the late sorts in by the first week in March.—THOMAS RECORD, Lillesden.

FELIX GENERO ROSE.

I do not wish to impeach "D." of Deal's judgment with regard to Roses. I think, however, owing to the general vigour which he describes everything to have at Okeford Fitzpaine, he has seen Felix Genero through rose-coloured spectacles. Since writing about it, however, I have been told by two much better judges than myself that it is a good Rose, and useful for exhibition purposes; but the chief merit they attach to it is, that owing to its being of a different shade of colour to most Roses, it helps to diversify a stand of Roses, and acts as a foil to other and brighter colours. It also has the merit, which is a valuable one for exhibition purposes, of keeping its shape well after it is cut. My object in writing was merely to warn amateurs who have only room for, perhaps, 150 to 200 Roses, that it was not worth their while to order several of Felix Genero to the exclusion of other and better sorts; and though my friend, the Rev. S. R. Hole, was one of those who told me I had put too light an estimate on it, yet he himself has not so high an opinion of it as Mr. Radclyffe, if I may judge from the fact that when I was at Caunton on the 6th of August he had finished budding Briars to the number of 1440, and had not put in a single bud of Felix Genero. It may be by way of euphemy called a violet Rose, but with me it is dull red, with a lilac shade in it.

It may seem hereby on my part to venture to differ from Mr. Radclyffe, but I cannot see the wisdom of the advice which he has more than once given to amateurs who have asked for lists of Roses, to grow a hundred of Charles Lefebvre and a hundred of Jules Margottin. Many amateurs have only room for a few Roses to begin with, and certainly, good as Charles Lefebvre and Jules Margottin undoubtedly are, there are at least fifteen or twenty just as well worthy of cultivation.—C. P. PEACH.

ONIONS AT OKEFORD FITZPAINE.

The White Spanish are small. The Underground Onions also are not their usual size. The Portugal Onions are fine and still growing. The seed was sent by Messrs. Barr and Sugden, as received from Her Majesty's Consul at Oporto, Mr. Crawford. It was sown in pans, and kept during the winter in my vinery. The Onions were planted out in February, over

cow dung sunk in the winter. They are not yet full grown; the largest two are respectively 11½ and 11 inches in circumference. Between the plants runners of Dr. Hogg Strawberry were planted in the spring, the flowers taken off, and they are now fine plants.—W. F. RADCLYFFE.

"REDCARRE, A POOR FYSHER TOWNE."—No. 2.

I TOLD in my previous notes of the superlative sands which here margin the sea, and I have now traversed the whole, from the mouth of the Tees near Middlesbrough to Saltburn—full seven miles. Between the sands and the main land is an almost unbroken series of huge sandbanks, bound down by the roots of *Carex arenaria*, *Phleum arenarium*, *Triticum littorale*, and other species of the maritime Gramineæ. They and *Ononis arvensis* (Rest-harrow), *Erodium moschatum*, *Cakile maritima*, and *Galium cruciatum* form almost the entire flora of these rabbit-tenanted sandbanks. But the ledges of rocks called the Scars abound in what are called, with wrongful depreciation, Sea-weeds.

"Ah! call us not weeds, but flowers of the sea,
For lovely, and gay, and bright-tinted are we;
And quite independent of culture or showers;
Then call us not weeds, we are ocean's gay flowers."

Though "independent of culture," yet they may be made tenants of that marine flower border the aquarium. I have my hand upon a charming little volume, the author of which, Mr. D. Ferguson, a schoolmaster, is resident here, and an accomplished naturalist. He says:—

"The red weeds are the most beautiful, and we have succeeded in growing them very successfully, but some of them are so delicate that they seldom endure confinement for a very lengthened period; yet there are others of the more hardy kinds, as the *Ceramium rubrum*, *Rhodomyenia*, *Iridaea*, *Polysiphonia*, and *Pilota*, which answer remarkably well; and the pretty little chain-like *Chylocladia* also thrives, and gives the miniature rocks an interesting appearance. To the green weeds we must resort for oxygenisers. The Sea Lettuce, the Purple Laver, and the Enteromorpha, are under some circumstances the best. Then we have the feathery *Eryopsis* growing freely in the still waters of the tank; and one of darker shade in the rock-inhabiting *Cladophora*. Many of these are plants of annual growth; all are composed entirely of cellular tissue, those parts that approach most nearly to wood being only compressed cellular tissue, and destitute of fibre. Being always immersed, or at least covered with water during the greater part of their existence, they have no need, like terrestrial plants, of organs specially adapted to absorb fluids, but their whole surface acts the part which the roots alone perform in land plants; they have, therefore, no true roots and the pedicel or footstalk by which the plant is fixed to the rock, is simply an organ of prehension, from which it receives, not sustenance, but merely support. We find many of the microscopic Alge very beneficial in commencing a tank, though not so effective in the appearance of the tank as the more highly developed plants, yet they yield a large supply of oxygen, and stud the rocks with beautiful crystal bubbles; such plants are the *Lyngbya*, *Oscillatoria*, *Bangia*, and *Conferva*. Whatever be the selection of plant, care must be taken that each is adherent to a piece of rock; and always choose the hardest rock; the soft blue lias is very apt to thicken the water by giving off the alumina which it contains, when in contact with the sea water.

"In many of the pools, growing very luxuriantly, you will find the *Gigartina mamillosa*, a very peculiar-looking plant, nearly resembling the *Chondrus crispus* so very common on West Scar, but easily distinguished from it by its warty appearance. The only time we have ever seen the *Desmarestia aculeata* in a growing state was upon this rock, in such a condition very different in its appearance from the hard beach-worm specimens; when young, each branch is beset with the finest pencilled filaments of pea green, these are succeeded by stiff spines of dark olive, hard and woody in their texture; but when you first gather the plant, it is impossible to conceive a more lovely object waving its delicately feathered fronds in your vase of water. Attached to the roots of *Laminaria digitata*, Tangle, may be found the pretty *Nitophyllum laceratum*, whose prescribed locality seems to be the strong stems of *Laminaria*, rocks or stones, but rarely within tide-mark, but here, as the rock projects so far into the sea we reach the Laminarian region, and as thus enabled to find, in a growing state, many of the delicate *Rhodospiræ*, or red-seeded Alge.

You will find on the north side of the rock a good supply of *Delesseria alata*, *Winged Delesseria*, the extreme beauty of which makes it much sought after; and notwithstanding the common occurrence of it on our shores, is never seen without attracting admiration. With equal beauty, in rock pools near low-water mark, the Escent *Iridaea* (*Iridaea edulis*) presents its red feathery leaves, many of which grow together from the same root; and from its jagged and eaten appearance we should imagine it the favourite food of many of the denizens of the deep. Another of the red sea weeds adorns the sides of every pool, the *Laurencia pinnatifida*, though one of the most common, it is certainly the most variable of our marine Alge.

"A beautiful feathery sea weed often adorns the roots of *Fucus aeratus*, or the stems of *Laminaria digitata*, this is the *Ptilota plumosa*, and you will often find it to be the abode of an interesting Zoophyte the *Membranipora pilosa*. *Ptilota sericea*, a plant much finer in texture than the preceding, decks the lower ledges with its silky fronds.

"The *Odenthalia dentata*, though recorded as not occurring south of Dnrham, abundantly ornaments the lowest ledges of East Scar, and a ridge of rock on West Scar, easy of access at very low tides. The living plant presents a very different appearance to the dried specimen, which is much darkened in drying. We have grown this elegant plant with other *Rhodospiræ* tolerably successfully.

"The *Choudrus norvegicus*, Norwegian Choudrus, though rather rare, is found in the deep pools on the north side of the rock. In leav- the Scar, the beauties of which we have endeavoured to unfold, you will find the *Porphyra laciniata* densely clothing the ledges of rock nearest the shore; this is the Purple Laver, one of the *Chlorosperms*, or green-seeded sea weeds; though called purple, it assumes at different seasons various hues or shades. Many of the rarer *Algae* are only to be found at extreme low-water mark, or at the lowest water of spring tides, either along the margin of the rocks partially laid bare, or more frequently fringing the deep tidepools left at low water. The side of the pools richest in Red *Algae* will be found to be the northern or shaded side; whilst the olive, or green, require a sunny position to bring them to maturity."

On the afternoon of the day on which I collected many of the *Algae* so commented on by Mr. Ferguson, I wended my way inland to Guisborough, celebrated even in Drayton's time for its lovely scenery. He thus describes it in his "Polyolbion":—

"Mark Guisborough's gay site, where nature seems so nice,
As in the same she makes a second paradise;
Whose soil embroidered is with so rare sundry flowers,
Here large Oaks so long green; as Summer there her bowers
Had set up all the year; her air for health retir'd,
Her earth with alum veins so richly intermird."

The last line refers to the first alum works in England being erected at Guisborough by Sir Thomas Challoner in the reign of Elizabeth. He noticed that the strata here are like those near Rome, and obtained workmen from the Pope's works near that city. His success reducing the price of alum, the Pope anathematised Sir Thomas! but, as Graves remarks, "the Pope's infallibility is in this respect to be doubted—the heretic flourished, and so do his descendants," one of whom, Admiral Challoner, is now resident at Guisborough Priory.

What tales and doings of the olden time does the naming of that monastery recall to my memory. This was a wild district when the Augustine monks were settled here by Robert de Brus in the twelfth century, and so exposed to the Northmen's inroads that in the fourteenth a royal license was granted to the Prior and Canons to fortify their house sufficiently to protect them from pirates and other marauders, from whom they had suffered severely. "The Prior kept a most pompous house, inasmuch that the towne, consisting of five hundred householders, had no lands, but lyved all on the abbay; and a steward of theirs was turned out of office, because he had aforehande but onley four hundred quarters of grayne to serve their house. But nowe all these lordings are gone, and the countrey as a wydowe remainethe mournfull."—(*Cotton MSS*)

However, a good time has come again; for although only the east end of the Priory remains, a noble fragment, and an arch of the north side, yet they are surrounded by a well-kept garden, and beneath the old sacred ruin is a spacious wine-vault, suggestive of the adoption of this inscription—

"There are spirits above, there are spirits below,
There are spirits of joy, there are spirits of woe;
The spirits above are spirits divine,
But the spirits below are the spirits of wine."

From that vault a subterranean passage is said to pass to a plantation in Tocotes, and a legend tells that midway there is an enormous chest of gold guarded by a raven, which keeps incessant watch over the treasure. Once only was it invaded, but when the intending thief reached the chest the raven was transformed to a demon, who belaboured the intruder so severely that no one has repeated the attempt. There is little reason, if any, for doubting that the legend was founded on the known wealth of the Priory. At the time of its suppression it was endowed with the patronage of more than fifty churches, besides many other estates and privileges, among which were the right to claim fish from fishing cobbles of Redcar. But this was not the only contribution to the refectory table of the white-tunicked monks, for there are notices extant of annual benefactions of poultry and other good things to their larder and buttery. The produce of the dovecotes of their let farms was always reserved. Be it ever remembered, too, that they

were the best husbandmen, gardeners, and orchardists of their age. No better testimony to this could be quoted than the fact that the "five hundred householders" of Guisborough placed all their lands under the management of its monks, to benefit by their superior means and knowledge.—G.

HORTICULTURAL CONGRESS AT OXFORD.

(Continued from page 81)

The following paper is that read on the first day of the Congress, by Mr. William Ingram, of Belvoir Castle Gardens.

THE FORMATION OF SOILS.

INVESTIGATIONS into the history of soils lead us far back to a voiceless, but not unrecorded, antiquity; and, tracing effects to their causes, we shall find ourselves carried beyond the written records of men, beyond the æges of iron, and bronze, and stone, and we shall be left stranded amidst the bewildered and struggling creatures whose destruction was accomplished during that eventful time called by geologists the glacial drift period. Some writers on soils have attributed their occurrence and formation to atmospheric causes alone. This theory will be found insufficient to account for all the various circumstances of soil occurring in this country. The preparation of the surface soil for the growth of plants is mainly due to the action of the weather, and we all know that rocks, and marls, and clays, exposed to the action of the elements, are disintegrated and pulverised, and that the particles scattered by the wind, or spread over the land by rain, enriched and carbonised by vegetation, form, during long periods of time, considerable accumulations of soil; but such causes as these are not adequate to account for the immense masses of earthy material composed of matters derived from the rocky crust of the earth, and consisting, in one place, of deep beds of clay, in another of sand and gravel, or loam, and distributed, with more or less irregularity, over the hills, and valleys, and plains of this island.

After the deposition of the lower tertiaries it would seem that Britain and the north of Europe underwent a vast revolution as to climate, and that some new arrangement of sea and land took place at the same period. At all events, the large mammalia of the earlier tertiaries disappeared, and the land was submerged to the extent of several hundred feet, for we now find water-worn boulders on the tops of our hills at an altitude of 1800 or 2000 feet.

A cold period ensued, and icebergs, laden with boulders and gravel from other regions, passed over these latitudes, and dropped their boulders on our then submerged lands. How long this process continued it is impossible to determine, but by-and-by a gradual elevation of the submerged lands took place. Our hill tops and ranges appeared as islands, and our valleys as straits. These islands were now covered periodically with glaciers; during a brief season avalanches descended, glaciers smoothed the hill sides, and left the *debris* as morasses of sand and gravel.

In process of time the land was elevated to its present level, another distribution of sea and land took place, and the glacial epoch passed away.

The agencies in action during this time were eminently calculated, as no doubt they were designed, for the production of results of the greatest possible importance to us, "the latest gifts of time." It appears to me to have been the most evident period of preparation for the race of beings that was to become dominant on the earth, and to glorify by intelligent appreciation the gracious gifts of God.

To the action of these great forces of Nature—turbulent seas, icebergs, glaciers, and the streams from the great ice fields, as the climate changed—may be referred many of the drift soils which I have already said are widely distributed, and which wherever they occur give their own character to our agricultural and horticultural productions. Looking broadly over the vast fields of Nature, we see a ceaseless round of causes and effects, of processes and products. Change alone is dominant. While we enjoy the great results of time, we must not omit to read the great lessons written in what I may call the ripple marks of these ancient sea margins, which, while carrying destruction to the mighty race of mammals of that time, caused the production of vast areas of soil fertilised more or less by the decay of animals and plants which were coeval with and commingled in the *debris* of a vast disrupted world of matter?

The causes which have subsequently contributed to produce the more important deposits of soil, are less in magnitude, and in the process of soil-making are fortunately unattended by such wide-spread destruction as that which occurred during the drift periods. The ceaseless and prolonged action of rivers, commencing in periods incalculably remote, and coming down to the present time, have necessarily produced immense deposits of soil. We have all had opportunities of seeing how the devious course of a river is changed by the waters acting upon the banks that bound it. Masses of sand, silt, mud, and gravel, are annually displaced and deposited, and loam beds, for future fattening fields, are being formed, inch by inch, and year by year. Our true and best loam beds are our ancient and matured river deposits.

While the rivers pierce and ramify through the land, displacing and reforming new beds of the matters through which they pass, they still carry onwards some of the spoils of the land into the bosom of the sea. Sea and land, like rival monarchs, are ever striving for

* *The Natural History of Redcar and its Neighbourhood*. By D. FERGUSON. London Simpkin, Marshall & Co.

mastery. At the mouths of our great rivers we have islands or deltas constantly increasing, which are destined some day, perhaps, to be rich pastures, where prize stock will fatten, or fair gardens where champagne Grapes will win future medals.

But the sea is sometimes generous, and gives tribute to the land. This is attested by the rich alluvial tracts along our eastern coast, for where the land slopes smoothly to the ocean, and the waters roll over a shallow strand, every tide leaves a deposit which, increasing thus, is at last embanked, and forms the rich alluvial fields that Lincolnshire delights in.

I have already referred to the operation of the forces of the atmosphere on the exposed surfaces of the earth. In the comparatively equable climate of our own country such causes as heat and cold, wind and rain, are in constant operation, and, as we all know, assist us greatly in the preparation of land, and the labour we bring to bear upon the earth's surface assists the process of disintegration.

Having thus cursorily glanced at the causes which have contributed in the greatest degree to the accumulation, dispersion, and deposition of the earthy matters that result in soils, before proceeding to trace out in detail the various deposits of soil, spread like a garment over the stony framework of the earth, it will be as interesting as it is important to our inquiry to examine the great rock system of England. We shall by so doing be better able to trace back to their natural beds or formations some of the drifts or accumulations of soil which are found to occur, more or less abundantly, on different places.

From the western end of the Cheviots a mountain range commences, termed the Pennine Chain. It stretches due south through Northumberland, Cumberland, Lancashire, Yorkshire, Derbyshire, and with a break terminates in the small mountain range of Charnwood, in Leicestershire. A great part of this range is composed of carboniferous rocks, lying in an anticlinal ridge, and having the lower series of rocks in the centre and the upper in the flanks. Connected with this chain is a group of mountains, occupying part of Cumberland, Westmoreland, and Lancashire; these form the Cambrian group of the lake district, and present the highest summits in England (Helvellyn, 3,055 feet). The stratification of these rocks has been disturbed by intrusive masses of granite and igneous rock. The old red sandstone or Devonian has a considerable development in Herefordshire. That important section of the carboniferous system, the coal measures, occurs extensively in the north of England, Yorkshire, Lancashire, Derbyshire, Notts, Lincoln, and Stafford. The lower red sandstone fringes the northern coal field, and appears in Shropshire associated with the coal formation. The magnesian is found in Northumberland, Durham, Yorkshire, and Nottinghamshire. The new red sandstone spreads from the foot of the rocks already described into great rolling plains which occupy a large part of some of the midland counties; an extension of this system runs down the valley of the Severn, through Somerset and Devon, to the mouth of the Teign. A similar extension runs through the county of York to the Tees, while a third occupies nearly the whole of Cheshire.

The secondary rocks, from the lias to the chalk, strike regularly across it in a S.W. and N.E. direction, and presenting escarpments to the W. and N.W. The softer portions of these formations make plains or valleys, and the harder and stronger rocks long ridges of hills. We have thus the plain or valley of the lias running from Lyme Regis to Whithy. Over this comes the oolitic escarpment. As the chalk dips towards the east, it becomes overlaid by tertiary beds, which extend from Norfolk to Hampshire, with one remarkable interruption. This is a broad and elevated ridge of chalk that extends from Salisbury Plain to the N.E. of Winchester, where it divides into two ridges, one the North Downs, the other the South Downs. In the centre of this valley rises a ridge composed of Hastings sand, the beds of which have been largely removed by denudation.

The tertiary beds of the south-east of England are separated into two parts, occupying two basin-shaped depressions, called the London and Hampshire basins. Every rock formation which I have described has been more or less denuded by the operation of the various causes incident to the drift period, but notably by glacial action, and by the great boreal and the subsequent eastern drift. Had the carboniferous and red sandstone formations been composed only of rock, however powerful the action of the agencies brought into play during the pleistocene period, the resulting *detritus* would have been great plains of gravel and boulders—fragments, in fact, "confusedly hurled like relics of an earlier world." The preparation for the great events that caused the dispersion of soil had preceded the time of their occurrence. The ancient seas of the carboniferous period had formed from the waste of the granite, silurian and Devonian systems, immense beds composed of shales, clays, slates, and sandstones, while the profuse vegetation of the period added the coal beds. The displacement, amalgamation, and dispersion of these matters is evidenced throughout the system. The deep valleys that intersect the mountain masses of the carboniferous rocks show the amount of denudation they have suffered; and the *debris* are scattered far and wide over the land. Some of the best soil in the northern counties is composed of the matters borrowed from those ancient rocks.

Chatsworth, amongst other places, owes some of its deep-loam beds to the degradation of the neighbouring rocks; and the feeding meadows that surround ancient Haddon have lost none of their fertility although they fattened heaves for the hospitable owners of the Hall centuries ago.

The upheaval of the millstone grit in Derbyshire, and the subsequent waste of the stone, has formed over a wide extent of surface a poor, siliceous soil, which sustains heath and endless moors. This is an example of what I call a primitive soil, one obtained directly from the wash or decay of rocks or marl beneath. This, too, is first in my list of peat soils, on which I shall comment presently. The mountain limestone, which is one of the divisions of the carboniferous, is associated, but not intermixed, with grit. Its purely calcareous character separates the vegetation of the two rocks as widely as the poles; and while on your right you see the purple Heather blooming, on your left you have woods and corn fields.

The next important soil-producing formations to be noticed are those derived from the permian and triassic systems. These, by their subordinate elevation and central position, the previous character of their shells and marls, suffered greatly from the denuding action of the various drift currents to which they were exposed, and, consequently, contributed an immense amount of earthy matter over the whole face of the midland and south-eastern counties. The red loams, of which, fortunately, we have many examples, are derived from these marls, intermixed with gravel and vegetable *debris*. The Banter conglomerate of this system gave rounded pebbles, the gypsaceous beds of the lower series sulphate of lime; altogether the mineral matters from this system are of incalculable value in fertilising vast tracts of land.

An example is offered in this formation of benefits conferred but not enjoyed. The pebbly beds of the conglomerate remain undisturbed, a poor siliceous gravelly soil is the result, the marl beds below being out of reach. This affords some of the least profitable land in Nottinghamshire. A crystallised form of magnesian limestone occurs at Mansfield, but this is overlaid to a depth of 10 feet by beds of marl, interstratified with a band of limestone. As a rule, it is not safe to assume that the surface soil partakes exclusively of the character of the substrata, and contains its essential principles; and in recent discussions some eminent gardeners have made the mistake of supposing the surface soil above the dolomite rocks to be invariably made up of their *debris*, when in reality the rocks are too far below the surface to affect vegetation.

Descending in the series, we find the upper beds of the oolite, the lias, have suffered extensive denudation; an immense quantity of limestone, clay ironstone, has been swept away from the oolites throughout Leicester and the adjoining counties. The sweeping effects of the currents of the drift, as the land gradually rose, are very evident. The relics of our rocks, in fragments of stone, fossils, and ironstone nodules, may be found scattered through the gravel beds of the counties south-east of us, as well as filling some of our own valleys.

We hear occasionally of great agricultural as well as of horticultural achievements in our eastern counties. Sporting gentlemen tell of Turnips whose growth reaches the knees, and gardens eminent for the excellence of their products are known to us all; but while conceding a great deal to skill, I must, as a faithful chronicler of soils, attribute not a little to their influence in securing such favourable results. Throughout the northern and midland counties we find, as I have described, the great rock system scored, and rent, and abraded of a portion of the mineral treasures of the red sandstone, the oolite lias, chalk, swept away, and this grand compost spread as a dressing over the limy, craggy beds of Norfolk and Suffolk. Can we wonder that Turnips grow? or that "Mrs. Pollocks" are evoked? or that man has been rendered eloquent, when half a country has been broken up, and its fertile stores given to these happy lands in the east?

The cretaceous groups which comprise the chalk and the greensand are not very extensively developed, although the white chalk cliffs have given a name to our country. We are all more or less acquainted with one of the products of the Downs, which have given us a breed of sheep (Southdown) few fail to appreciate.

But little drift rests on our chalk hills, and the sparse flinty soil, though fertile with management, requires good farming or good gardening to bring it up to the mark. The numerous valleys which intersect the formation contain deposits of detrital loam, while beds of clay and gault occur in the system. The associated greensand formations are developed largely in Surrey, Bedfordshire, and Kent. The greensand of the latter county forms a base for the peat soils, which, according to certain notions, produce a wonderful effect on the growth of Heaths. The upper and lower greensands are, under good cultivation, valuable for early cropping and for seed lands. The two well-known examples of the tertiary system which I shall instance, are the London clay and the Bagshot sand. I cannot speak in terms of very high commendation of the horticultural capabilities of London clay. It is very hard to work, and, like a dull boy, requires a good deal of keeping up when it reaches the friable point. It does not equal the lias, plastic, or gault clays, when made into a soil.

I have spoken a little regretfully of the waste of some of the formations, but when I approach the Bagshot sand, that dreary waste of comminuted silica that runs through parts of Surrey, Sussex, and Hampshire, I can only say that it is a matter for regret that some of it at least was not overwhelmed, like Norfolk, and either its sandy wastes swept away or covered over with a few feet of loam, which, were it spread upon these heathy barrens, would make this tract of country smile like a garden. The pebbly beaches and sand beds, poor and hungry as they seem, are gradually submitting to reclamation, and being healthy, are attracting the smoke-dried Londoner, who may

gather health, if not profit, in the pursuit of gardening under difficulties. But we must forgive the general sterility of this formation when we remember the Rhododendrons and Azaleas, and the vision of beauty we have before us now in Oxford in Mr. Jackman's varieties of Clematis.

The natural world is replete with examples of agencies compensating wasted powers, and effecting restoration—evolving new forms. We have seen how the hills have been riven and washed, and the fragments spread far and wide over the land and sea. An illustration of the saying, that nothing is ever lost, is before us in the rich, alluvial plains that are found in Lincolnshire and elsewhere along the coast. If any one wants a proof of the influence of soil and situation on animals and plants, he should go first to a hilly inland district in Derbyshire, and after looking at the cattle and the crops, he should proceed to Peterborough, Wisbech, Sutton Bridge, or to Sleaford and Boston—he would find cattle double the size, and corn crops at least twice as productive as in the colder country. Here we come to a grand result, and a great example, in showing what soil and situation will do. A realisation of an almost perfectly fertile condition of land is a sort of philosopher's stone to gardeners; and what often gives additional value to these fine alluvial plains, is that beds of silty gravel are found beneath them, and form the best natural Drainage. Nothing is wanting in such fortunate districts but increased elevation (50 feet heavenward). Some of our best seed grounds are found on these rich tracts, and the principle is quite right, to grow seed stocks on the most fertile land; there will then be no retrogression of type.

It would be interesting in a horticultural point of view, and at the same time it would tend to illustrate my subject, if I could follow out the river system of England, and write the story of all the streams that, springing from the heart of the country, flow ever onwards towards the sea. In the present instance I can only venture to indicate very slightly the influence of rivers, regarded in the light of soil-producing agents. A great arterial river is a great power moving through the land, and together with its tributary streamlets, which gather their quota of earthy matter from the land adjacent, effects great changes in the distribution of soil.

The gravel beds of a river help us to understand the history of its wanderings. Pebbles of quartz and grit, and eroded fragments of granite, a lump of mountain limestone, tell us that the water has passed over an ancient drift bed. The Trent gravels are very much made up of the pebbles from the Bunter conglomerate, and the meadows that spread out through its wide valley show, in occasional sections, that the rich loams that belong to it were borrowed from the marls and red sandstones, through which it has for so many miles forced its way.

An immense gravel bed fills up the valley of the Thames to a distance of fifty miles. The gravel is composed chiefly of chalk flints. The great beds of loam which rest from one to several yards in thickness on the gravel bed, appear to be an alluvial deposit of the post-pliocene time. This loam, derived from calcareous formations, clay, greensand, and gault, is an extremely valuable soil for garden purposes. I know three tributaries of the Trent; one passes through a great clay formation, another comes from the iron beds of the inferior oolite, and passes through lias clay and marl stone—its gravel is but the stone from the beds over which it flows. Another takes its rise amongst oolite hills, and in ancient times has given large sandy deposits to the valley through which it runs. An anxious gardener might look upon these light soils as suitable for American plants, he would be woefully deceived; derived from limestone they still possess some of the properties of that mineral, and are inimical to Heaths and Rhododendrons when planted in them. Each of these rivers, in a comparatively restricted area, has formed loamy deposits, which, derived immediately from, are exclusively characteristic of, the formations through which they pass. From these examples I judge that tributary streams bring down more waste in proportion from the land than the main streams, and give a more varied character to the loam beds that are formed in the main valleys.

I must not conclude my story of the soils without referring to the peaty deposits and the bog lands, which, having a special botany, are of greater interest and importance to gardeners than many ordinary soils. Nature has infinitely multiplied her forms of life, and adapted them to every circumstance of soil and position found in the world; nothing seems so abhorrent as utter barrenness. The desolation of our moorlands would be complete were it not for the Heather and Gorse, the Fern, Moss, and Lichen.

The weathering of the millstone grit gives us a poor siliceous soil; decaying Moss, and Lichen, and Heath, in process of time add the vegetable *pabulum* necessary to support these hardy denizens of the mountains. The greensands in Kent and Surrey, the Bagshot sands in Sussex and Hants, afford examples of peat soils. Wherever poor sandy drifts occur, heath and peat soil is found.

Bog is a product of decayed vegetable matter due to moisture; an alteration in the level of a district has caused the submergence of extensive forests, and so a black vegetable soil is formed. Most large rivers have boggy deposits, due to inundations, and to the course of the river being encumbered with weeds and rubbish, just as the Upper Nile is at the present day.

The value to us of either peat or bog is due to the fact of their perfect freedom from the taint of stronger soils. Pure sands and vegetable matter are always safe to employ.

In endeavouring to recall instances of an exceptionally favourable development of vegetation arising from the influence of soil, the mag-

nificent Oaks in Bagots' Park, North Stafford, are vividly brought to my recollection. The park is 1000 acres in extent, and splendid specimens of Oak timber occur all over it, but notably in the case of the Beggar's Oak, the Squire Oak, the King and Queen Oaks. These are giants amongst trees, and exhibit perfect vigour and health.

Knowing that red marl occupied to a great extent the country about Bagots, I had assumed that these trees were luxuriating, as they often do, in the rich marl beds of the red sandstone. A subsequent and closer inquiry proved my assumption erroneous.

The park is thinly covered by beds of the lower lias which have escaped denudation. These beds have not been disturbed by cultivation. A section on the north side of the park shows 1 foot of drift clayey soil, few pebbles, 2 feet clay, 2 feet laminated shale with micaceous particles, 3 feet mixed clayey rubble, 3 feet shale.

Nothing can be more unpromising, on first looking on this section, than the soil. The secret lies in the fact that all these apparently poor beds contain an exact balance of the mineral constituents of fertility in a state of slow decomposition. They are compact, without being too retentive of moisture.

I may, in conclusion, advert to the singular advantages enjoyed, in an economical point of view, by the assemblage within a comparatively restricted area of all the more important rock formations that belong to the earth, and by the position of these rocks, by which they are rendered accessible to, and their peculiar products more readily available for, the uses to which they are applied by man. England epitomises the world in its rocks and rich mineral products; such a land is a fitting home for representatives of the great races of the world, whose energy and intelligence have found a home and fitting field for the exercise of the best and highest human faculties. A land endowed like this is a fitting school for a hardy and enterprising nation, and the varied knowledge gathered in the pursuit of the industrial arts, manufactures, mining, agriculture, and horticulture, has fitted the adventurous men, the pioneers of civilisation and Christianity through the world, for the great works they are destined to accomplish. I think I may truly say that Englishmen generally are content to win laurels by successes achieved in prosecuting the arts of peace, in conquering the unproductive soil of those countries whose undeveloped resources remained too long in abeyance under the sway of the savage. The agricultural and horticultural productions brought together in this city of learning help to illustrate my remarks. The cereal riches and the blessings spread far and wide over the world, in fruits that gratify every sense, and flowers that gladden the very soul of man, are presented to us. The lessons gained in these bloodless encounters, these modern wars of the Roses, are carried by our ever-departing pilgrims to their distant habitations; and it is the glory and delight of our brothers in their far-off homes to gather together their flowers and fruit, and emulate the work of this, the parent Society of the world of horticulture.

The next paper which we shall give is that of Mr. Williams, of the Victoria Nursery, Holloway,

ON PITCHER PLANTS.

THE plants upon which, with your permission, I intend to offer a few cultural remarks to-day, and of which I have brought a few small specimens for your inspection, are amongst the most curious of Nature's productions which have hitherto been introduced to our gardens. They are known popularly as "Pitcher Plants," from the curious ascidia or pitcher-like bodies which terminate the midrib of their leaves.

In treating of Pitcher Plants, I shall confine myself exclusively to the genus *Nepenthes*, although, did time permit, the genera *Sarracenia*, *Darlingtonia*, and *Cephalotus* would be found equally deserving of attention.

Of *Nepenthes* we have now a considerable number in cultivation. Some are hybrid forms, which have been produced in this country, but the majority are introduced species, and, what is very singular, we appear to have introduced the least interesting kinds first. There are many large and most remarkable forms yet to introduce, which will be grand acquisitions for our plant stores. The names of those in cultivation are—*Nepenthes ampullacea*, *N. ampullacea picta*, *N. distillatoria*, *N. distillatoria rubra*, *N. Dominiana*, *N. gracilis*, *N. gracilis major*, *N. hybrida*, *N. hybrida maculata*, *N. Hookeriana*, *N. lavis*, *N. phyllamphora*, *N. Rafflesiana*, *N. sanguinea*, and *N. villosa*.

Some of these are hybrids which have been produced in the establishment of Messrs. Veitch & Sons; but beautiful as many of them are, they are entirely eclipsed by some kinds yet unintroduced, such as *Nepenthes Lowii*, *N. Rajah*, *N. Edwardsiana*, *N. Boschiana*, and some others, which I am extremely anxious to see in cultivation.

Many absurd stories are in circulation respecting the uses of the curious ascidia developed at the extremities of the leaves of these plants. The most popular amongst these describe how the plants are endowed with such extraordinary vitality as to enable them to grow in arid sandy deserts, where nothing else in the shape of vegetation exists; that they have the power of distilling water to fill their pitchers; that the lids are closed down to prevent evaporation; and that birds, animals, and even man is accustomed to resort to them to allay their thirst with the cool and pure water found therein. It is scarcely requisite for me to state that these are nothing but pretty fancies, the fact being that they grow in boggy swampy soils, and cannot exist long in an arid atmosphere.

In *Nepenthes Hookeriana* and *N. Rafflesiana* an extraordinary alteration in the form of the pitcher takes place as the plants attain height. Thus, the leaves which are near the base, and the lateral growths, produce pitchers broad at the base, broadly winged in front, with ciliated hairs at the edges, and the long petiole is attached in front, and passes up between the wings. But in the pitchers produced higher up the stem a wonderful alteration takes place: the petiole is attached behind, the pitcher becomes narrow at the base, and the wings entirely disappear. To the cause of this alteration of form I have utterly failed to obtain the slightest clue, and I should be extremely glad to hear the opinion of any gentlemen present who may have given some attention to the subject.

The species of *Nepenthes* appear to be entirely confined to the Old World, and chiefly find their homes in the islands of the Indian Archipelago, where they grow in boggy soil at considerable elevations—in indeed, in some instances up to 9000 feet—the mountain of Kina Balon, in Borneo, appearing to be their head-quarters. Two species (*N. cristata* and *N. madagascariensis*) are found in Madagascar; the Philippine Islands also produce one or two species, which, however, are not peculiar to them, and one species (*N. gymnochora*), which grows plentifully in Java and several other islands, is also found in New Caledonia. Another species (*N. phyllamphora*) is said to grow on the Khasia Hills, at an elevation of some 3000 feet, and this is probably the extreme northern limit of the genus.

Few people have had the pleasure of raising *Nepenthes* from seeds, and this brings me to my principal object in writing these remarks; for as there are a quantity of grand species yet to be introduced, a few of which I have already named, and as it is not generally known that the seeds of these plants do not long retain their vitality, I wish to impress upon the minds of any and all who are either about to proceed to the countries they inhabit, or who may have friends resident there, the absolute necessity there is that seeds should be sent home by post as soon as gathered; and I wish our home cultivators to remember that these seeds should be sown immediately upon arrival, irrespective of the season. It has been my good fortune, during the course of my gardening experience, to raise young plants of *N. distillatoria* both from home-grown and imported seeds, and I may safely say the pleasurable feelings created in watching their curious leaves unfold, far surpassed that derived from the growth of any other seedlings, but at the same time, the doubts, hopes, and fears for their welfare were equally increased.

Under the impression that an account of my system of raising these seeds may be of service to some, I shall in concluding this paper offer a few remarks on that subject. The seeds having been obtained, take a well-drained seed pan or pans, and fill up to within an inch or two of the top with a mixture of peat and Sphagnum moss in equal parts, adding a little silver sand to keep it sweet. Upon this the seeds should be sprinkled, and not covered with soil. This may seem wrong to those obtaining the seeds for the first time, because they will appear to be large, but, if examined, they will be found to be in reality very small, and enclosed in a long loose tunic-like covering, which is evidently a provision of Nature to float the minute seed to a safe position for its germination. This loose coat also serves to protect the roots during the early stage of existence, for it is some time after germination before roots are protruded from the tunic. The seeds having been sown, the pan must be either covered with a bell-glass, and plunged into a bottom heat of about 80° or 85°, or what is better, the seed pans should be placed in a small close frame, where this heat can be maintained. In this temperature they should begin to germinate in the course of a month or five weeks; and it is very curious to observe that the very first leaf which is formed after the seed leaf is like a little pitcher—not like those you see upon the plants now before you, but very much resembling miniature leaves of the *Sarracenia purpurea*. These are produced freely and quickly, and the plant soon resembles a little ball, with its numerous almost sessile leaves. As soon as the roots begin to spread, the seedlings should be transplanted singly into very small pots, but still kept in the same temperature and close moist atmosphere until they begin to assume their normal form.

These plants will succeed either in pots or in baskets. I prefer the latter, because they display their beauties to the greatest advantage; but whether grown in pots, baskets, or tubs, or planted out in a prepared border, it must be borne in mind that they require more surface than depth, and that the soil must be open to allow their black woolly-looking roots to spread. Frequent applications of water over the foliage, through the agency of the syringe, will be necessary during the day, and a liberal supply to the roots will be found advantageous. These rules being attended to, and the plants shaded from the sun's rays to a greater extent than is usually done, *Nepenthes* will not be found difficult to cultivate, whilst their unique and peculiar beauty is a never-failing source of wonder and astonishment.

In conclusion, I sincerely hope to see the species we already have, cultivated to a far greater extent than has hitherto been the case, and the fine species from Borneo and the surrounding islands speedily introduced to our gardens.

THE ROYAL HORTICULTURAL SOCIETY'S GLADIOLUS SHOW.—As will be perceived by a notice in our advertising columns, this will be held on Wednesday next; and as good prizes are offered, both to British and foreign growers, nurserymen and

amateurs having each separate classes, we expect an excellent exhibition. The Hollyhocks, too, notwithstanding the drought we have experienced, will no doubt contribute their share to the interest of the Show.

APPLETON-LE-STREET FLORAL AND AGRICULTURAL SOCIETY.

It is not our practice to notice the exhibitions of local horticultural societies unless there is something in connection with them which calls for especial notice, and which has an interest for our readers far beyond the district in which the exhibition is held. Such a Society is the Appleton-le-Street Floral and Agricultural Society, founded three years ago by our valued correspondent the Rev. C. P. Peach. It is because of the singular success which has attended the progress of this Society, and the impetus it has caused in the neighbourhood, that we give it this prominence; and it is also as an encouragement to others to do as Mr. Peach has done that we state the following facts. In 1868 the total number of entries of horses, cattle, sheep, pigs, and poultry was 254. In the following year they amounted to 308, and this present year they reached the extraordinary number of 434, of which 203 were for horses. In the horticultural department the same ratio of increase was maintained, and as evidence of the quality of subjects shown in that department we give Mr. Peach's comments on an exhibition which attracted great attention.

"I have seldom, if ever, seen a better collection of Carnations and Picotees than those which were exhibited by Mr. George Edwards, of York, at our Floral and Agricultural Show, at Appleton-le-Street, on the 26th of July. They were all seedlings of Mr. Edwards's own raising, and reflect great credit upon the care and attention which he must have given to the plants before he could have brought them to that state of perfection. As one of the Judges of the Carnations and Picotees at the late Royal Horticultural Exhibition at Oxford, I am convinced that those exhibited by Mr. C. Turner, of Slough, were the only ones at all to compare with these seedlings of Mr. Edwards's, which he sent here. Mr. Edwards was second to Mr. Turner at Oxford, but, having to contend with a more northern climate, his blooms were too backward to compete with Mr. Turner from Slough, but if he had been able to get his seedlings which he sent here forward enough for competition, it would, in my opinion, have been a very near struggle.

"Among the seedlings sent by Mr. Edwards, the best were—George Edwards, scarlet flake Carnation; Mrs. Edwards, purple flake; Mr. Paley, rose flake; Mr. Dove, J. Davidson, Mrs. Smith, and J. Holliday, bizarres, of which the latter seems to me a great acquisition.

"Among the Picotees the following struck me as of great merit:—Ada and John Feather, heavy-edged red; Fairy and Sweet Lucy, light-edged red; British Sailor, heavy-edged pink; Rosa and Mrs. G. Edwards, light-edged pink; Delicata, light-edged mauve, the latter a great acquisition, one of the best mauve-edged Picotees I have ever seen, and John Feather equally good as a heavy-edged red. Mr. Dove has the quality, a very valuable one in exhibition flowers, of lasting well, and will, in my opinion, prove a very useful addition to the list of show Carnations.—C. P. PEACH."

The amount of money received has been also in proportion to the increase of the exhibitions. In 1868 it was £90; in 1869, £128; and we believe this year it will be as much as £150.

STRAWBERRY CULTURE.

We are agreed upon the necessity of eradicating sterile plants, and propagating only by runners taken from fruitful stocks, or stools. We might venture to add, and agree, that runners drawn from stools not worn out, as well as fruitful, are still better than when drawn from old, although fruiting stocks. In other words, runners off stools at most of one and two years' growth are best, as partaking of the fruitfulness and vigor of their parentage or stock.

We are not, however, quite agreed upon the mode of planting our runners, some adopting the ridge-and-trench (Potato fashion), and some the level bed plan, the plantations in each mode being in single rows, varying from 12 to 15 or 18 inches in the distance of the plants apart laterally and longitudinally. Bed or ridge is the question in comparative merit. In either event—bed or ridge—the land is easily trenched spade deep, and interlaid, or underlaid, with rotten manure, the merit of

each plan being so far equal. The planting, too, in lines or rows is also of equal merit. It is when we come to the ridge that the merits of the bed and ridge plans diverge. The ridge plan forms parallel mounds, with the soil drawn or sloped upwards, the plants sitting on the summit and drooping into the intervening trenches or open drains. Have any of your readers observed that the plants are thus occasionally blanched like Celery, and that sometimes the ridges drop or fall, and the plants perish from exposure to drought, or frost and cold winds? And has it been noticed that the trenches carry off, like drainage, the moisture so essential to the Strawberry in its period of swelling before ripening fruit? And has it been seen that ridges cannot be easily mulched or top-dressed, the manure tumbling into the trenches, and having its virtues washed away as sewage? Such features in ridge planting have occurred under my own observation, and I place them before your contributors for comment.

The bed is my choice. Beds 4 feet wide, to reach across from each side in weeding, &c., with two rows of Strawberry plants, all equidistant, say 12 inches, the ground trenched and underlaid with manure, are my system. Thus the plants sit firm and hard beneath the wind, the ground retains its natural moisture, and the mulching with short litter and manure by hand or weeding-fork is little trouble, the mulching being also allowed to remain as a winter protection, and to sink into the beds. It neither blows nor washes away. Weeding is all that is needed, and that is easy across 4-foot beds with 12-inch pathways between. Thus I plant, grow on two to three years, and trench, manure the soil, and plant and mulch successively the same beds (no rotation of crops) satisfactorily.

Many growers use straw for protection from dirt in the fruiting season. Straw has the worse property of enticing birds and slugs, as well as damping and moulding the fruit in damp weather; besides, straw confines the heat of the earth, and makes the under sides of the Strawberries soft and watery in flavour, at least I think so, and I use nothing except, for a choice stool here and there, a few broken flower pots or tile layers and reflectors. Netting for bird-scaring, and vegetable charcoal dust and sharp sand, hand-scattered, for slug protection!

As regards the sorts of Strawberries fancied, we may differ as we are located. My choice is Lucas, President, Eclipse, Rivers's Eliza, John Powell, Fairy Queen, Filbert Pine, Dr. Hogg, Frogmore Pine (though Frogmore Pine ripens badly in dull weather), and Wonderful; and taken all in all—flavour, size, and productiveness, I think them the cream. Of La Constante, La Chalonnaise, Marguerite (washy), Sir Harry, and Cockscorn I can make little but a few far-apart fruit not worth the room of the plants. However, "tastes differ."—READER.

GARDENING AS A RECREATION.

I would recommend every man in the autumn of his life to take to gardening, if he has not already experienced its pleasures. Of all occupations in the world it is the one which best combines repose and activity. It is rest-in-work or work-in-rest. It is not idleness; it is not stagnation—and yet it is perfect quietude. Like all things mortal it has its failures and its disappointments, and there are some things hard to understand. But it is never without its rewards. And perhaps if there were nothing but successful cultivation, the aggregate enjoyment would be less. It is better for the occasional shadows that come over the scene. The discipline, too, is more salutary. It tries one's patience, and it tries one's faith. The perpetual warfare that seems ever to be going on between the animal and the vegetable world is something strange and perplexing. It is hard to understand why the beautiful tender blossoms and the delicate fresh leaflets of my Rose trees should be covered with green flies and destroyed as soon as they are born. It is a mystery which I cannot solve; but I know that there is a meaning in it, and that it is all decreed for good, only that I am too ignorant to fathom it. And even in the worst of seasons there is far more to reward and encourage than to dishearten and to disappoint.

There is no day of the year without something to afford tranquil pleasure to the cultivator of flowers, something on which the mind may rest (using the word in its double sense) with profit and delight. If there is no new surprise, no fresh discovery for you, there is always something to be done. "The garden is a constant source of amusement to us both," wrote Dr. Arnold in one of his delightful letters—he was writing of himself and wife; "there are always some little alterations to be made, some few spots where an additional shrub or two

would be ornamental, something coming into blossom; so that I can always delight to go round and see how things are going on." In the spring and summer there is some pleasure-giving change visible every morning, something to fulfil and something to excite expectation. And even in the winter, flower culture has its delights. If you have a greenhouse or conservatory, no matter how small, you have an in-doors garden, in which you may watch the same changes and enjoy the same delights. And if you have not, you may still do something to preserve your nurslings during the rigours of the hybernal season. Indeed, there are few states of life in which floriculture is not an available enjoyment. To rich and to poor it is a blessing equally accessible. "As gardening," it was observed by Sir William Temple, who has had a new lease of life in one of the best of Macaulay's "Essays," "has been the inclination of kings and the choice of philosophers, so it has been the common favourite of public and private men, a pleasure of the greatest, and the care of the meanest; and, indeed, an employment and a possession for which no man is too high or too low." I am disposed, indeed, to think that to men of low estate it yields greater joy than to those who hail from high places.—(*Cornhill Magazine*.)

VIOLA CORNUTA.

ALLOW me to inform Mr. Robson, that although my *Viola cornuta* and Yellow Pansies were not planted until June, I have never seen them do better. They have been, and will yet continue for some time, a perfect mass of blossoms. They are both new introductions here, and have been the admiration of thousands. Indeed, the bedding has been very much admired, more especially the mixed and tricolor beds. The old style of bedding solid masses of colour has to a great extent been abandoned this season for the first time, much to the gratification of all who visit these grounds.—EDWARD BENNETT, *The Gardens, Enville*.

DOUBLE-FLOWERED PELARGONIUMS AS BEDDERS.

I HAVE to thank "D., Deal," for his article on this subject at page 78. I agree with his remarks as to the suitability of double-flowered Pelargoniums for bedding purposes. As "D., Deal," says, there are no seed pods—undoubtedly a great advantage of double-flowered varieties as compared with some of the single-flowered sorts, of which Christine and most of the Nosegays require almost daily attention to keep up a decent appearance during dry hot weather. In rainy weather the flowers of the double kinds, though much more compact in the truss than the single-flowered, are not so soon destroyed by wind and rain; indeed, a heavy rain spoils the beauty of the single-flowered sorts for a time, until, in brighter drier weather, more flowers open. The double-flowered kinds are not in the least the worse of a heavy rain, but should the weather continue dull, as it often does for several days together, the trusses, from being so close, are "matted together;" the whole truss, from the decay of a few flowers in the centre, is then soon a mass of white mould. During bright hot weather is when they shine, as do all kinds coming up to the florists' standard of excellence—those with good trusses of well-formed flowers, as Lord Derby, Editor, and others, which "D., Deal," grows, and which more of us would grow if they flowered profusely and recovered more speedily after wet and cold. The double and large-flowered kinds suffer less from wet and cold than the smaller-flowered, but during a continuance of wet they damp to a pitiable extent, and are very slow of recovery.

However, like "D., Deal," I am so well satisfied with my experience of them out of doors that I intend to give them a more extended trial, and would advise others to do the same. All seasons are not wet; in a dry bright summer they greatly outvie those we should not keep except for their free continuous blooming. But why discard kinds whose only fault is a free vigorous habit? Are there no large beds to fill, or back lines in borders where height is an advantage rather than otherwise? Gloire de Nancy has rosy scarlet trusses very effective for large beds; Madame Lemoine is of course to be preferred for smaller beds and where low growth is desired, but the idea that all our plants ought to be pigmies if they are to have a place in our gardens seems ridiculous. We might as well lay down a carpet at once as fill our beds with dwarf plants only. Height is as necessary for effect as colour, and quite as essential in producing harmonious pleasing arrangements. The great evil of

our flower parterres is having the plants huddled together. There is, no doubt, a great number of plants put in a small space. Distinctness of feature is practically ignored in flower gardening. Fewer and larger beds, with more space between, would do more to place our flower gardening on a level with a painter's ideal than anything else.

Of the double-flowered *Pelargonium* one most likely to meet our views of a bedding *Pelargonium* is *Madame Rosa Charmeux*. In habit, foliage, and flowers it resembles *Tom Thumb*, and is of similar dwarf habit and very free-flowering.—G. ABBEY.

THE FIG AND ITS CULTURE.—No. 7.

SETTING THE FRUIT.—How little we know really respecting this important process, and with the Fig least of all! In this, the organs of fructification being hidden from our view, we cannot tell how or when fertilisation is effected; therefore, it is but little we can do to assist matters. The time when it is supposed the setting takes place may be known by the eye, which assumes a pinkish hue and expands a little, thus giving admission to a little air into the interior, where the flowers are.

In many parts of Italy, and the south of Europe generally, especially in olden times, but still to some extent at the present day, the Fig cultivators pay much attention to setting the Figs, and very much has been written on what is called caprification. This is a practice much believed in by those who practise it, but is condemned by most modern scientific writers as absurd. The process, stripped of all its mystification, is a simple one. There is, in the first place, "a wild species called the Caprifig, on which it is said a certain insect exists, which enters the fruit when in a young state at the eye, thereby facilitating the entrance of light and air, or some fertilising vapour, whereby the flowers are enabled to set and ripen. In Fig plantations numbers of this wild species are planted for the sole purpose of bearing these insects, and at the proper season the fruits, with the insects, are carried and deposited on the fruit or shoots of the domestic species." There are in southern France the Fig trees, called *Caprifiguers*, which bear the insect, and also the men who carry and place these insects about. Without all this manoeuvring it is faithfully believed but very scanty crops of Figs would be secured, but this, according to my experience, is altogether a delusion, and is only alluded to here as such.

About the time when it is supposed the fruit is setting, it is well to be extremely careful as to all the conditions which would be likely to affect the plant. It is well to keep it in a uniform state as to moisture at the roots—it is better to be rather dry than otherwise—and to preserve an equable temperature, rather airy, if possible. The whole subject, however, is somewhat obscure, the particular stage and the particular treatment required being only understood by long experience.

CASTING THE FRUIT.—This is a result of defective setting. There can be little question respecting that. It is a very common occurrence, and altogether a very puzzling one. It most usually happens to the first crop, more rarely to the second, and some varieties are far more apt to do so than others, even particular plants have a greater tendency to cast their fruit than others. There is nothing more tantalising or vexatious in Fig culture than this. A plant may be loaded with beautiful fruit, which grow to a goodly size, and appear to be developing themselves beautifully, when suddenly they assume a yellowish sickly hue and fall from the tree. Very frequently this is the case with the entire crop on that particular plant. If these fallen fruit are examined by cutting them lengthwise, a great difference will be observed between them and those which do not fall. In the former there is a great cavity, the little florets of the interior are undeveloped, and there is no seed formed. In the others the parts have increased so much that the fruit is almost solid, seeds are there in abundance, and every part is perfect. It is clear, then, that the flowers have not set and the fruit falls, as with the Apple, Pear, Plum, or Cherry. With some fruits the setting is not material to its development, as in some of the Cucurbitaceæ, where the fruit so-called will grow and ripen without possessing a single seed. In the Grape, again, the absence of the seed only checks the development of the berry to a certain extent.

I need not, however, pursue this subject further, but inquire, How is the casting of the fruit of the Fig to be prevented? Get the fruit to set properly. How to do that I have already stated as fully as I am able, with this addition for trees grown in pots—Have the pots set on a bed of ashes, it is better than staging or shelving of any kind. It is cool and equable, always

retaining a little moisture, which is comfortable to the roots, which speedily find their way into it and enjoy it much. Some cultivators are very positive in ascribing the evil to direct causes, such as dryness at the root, or the reverse—too much moisture—or to some sudden check, as excessive cold, excessive heat, &c. In so far as these may affect the actual setting of the fruit they tend towards it, but not otherwise or further. Sudden checks, or extremes of any kind, are at all times injurious, and especially so at the critical stage of setting. I have tried experiments in many ways, subjected plants to every extreme, and the results have been very different from those which ordinarily occur without our sanction with plants well-known for their persistency in holding on their fruits; excepting by positive injury to the plant I have in no instance succeeded in the wholesale casting of the fruit, as is naturally the case. No, we want some power given us to set the fruit of the Fig, as we do Peaches in dull cloudy weather.

FRUIT-RIPENING.—Fruits of all kinds when ripening require a dry and bracing atmosphere, and rather cool than otherwise. Immediately the fruits begin to ripen less water should be given to the roots, otherwise the fruit will become watery and tasteless. With trees in pots only enough should be given to keep the foliage healthy, and at the same time a drier atmosphere should be secured in the house by syringing less,

Fig. 12.

applying more air both by night and by day, and applying fire heat if necessary for that end. With the first crop of fruit it is somewhat difficult to follow-out this practice exactly, as it is in a great measure injurious to the progress of the second crop; some modification is here required which can only be gained by experience. In some parts of France it is stated to be a not-uncommon practice to prick the eye of the fruit with a straw or quill dipped in olive oil. Brandy, also, is employed for the same purpose by dropping a little in at the eye, or through a puncture in the skin, the object being to hasten the maturity of the fruit and improve the flavour. I have had no experience as to its effects. I may just observe, as bearing somewhat on the point, that fruits damaged in the skin, or otherwise deformed or injured, are frequently much more highly-flavoured than the more perfect examples.

Figs, to be enjoyable, must be thoroughly well-ripened; a half-ripened Fig is simply abominable. The outward appearances which denote the highest excellence in ripe Figs are

these—The fruit is bent at the neck and drops its head a little; there is a large drop of juice at the eye, like a great tear; the sides are cracked lengthwise, and the juice is seen exuding a little and standing on the surface like great dewdrops on the petals of a Rose. That fruit is in a condition fit to eat, and its appearance does not belie its quality. With some varieties, such as the White Ischia, Black Provence, &c., and in warmer, drier climates, the fruits dry up a little and assume somewhat the character of a sweetmeat. These are simply delicious.

The engraving here given (fig. 12), represents the mode of production of the second crop of fruit in the axils of the leaves on the wood of the current year's formation, as stated in my second paper (vol. xviii., page 162), to which it should be referred.—A. B. C.

TO PREVENT CHASSÉLAS MUSQUÉ GRAPE FROM CRACKING.

EVERY gardener who has grown the Chasselas Musqué Vine knows how prone its fruit is to crack, and one of the finest Grapes in cultivation is rendered useless, if not worthless, by this unfortunate habit. An effectual method of preventing this has been discovered, and for some time successfully practised, by Mr. Speed, the talented gardener to the Duke of Devonshire, at Chatsworth. It consists in simply making a sloping cut half through the stalk of the bunch, not sufficient to weaken it for the work it has to do, but enough to check the flow of too much sap, which is evidently the cause of the fruit cracking. This cut is very much such an one as is used in "tongueing" when plants are layered.

LOOKER'S PLANT COVERS.

WE have no doubt that these are good plant protectors; their sides, being of earthenware, retain the heat accumulated within

them, and exclude cold; but Mr. Looker is quite mistaken when he says they "generate" heat. Their ventilation is good, they are easily shaded and protected, and are very cheap.

WORK FOR THE WEEK.

KITCHEN GARDEN.

ALL vacant ground having been duly filled with crops of the Cabbage tribe, attention should be instantly given to *Celery*. The late crops of this should be planted forthwith, and the early crops carefully earthed-up. The following must be sown directly—viz., *Cabbage* for the main crops of next summer; Prickly-seeded *Spinach* for supplying the table from November to May; of *Onions*, the Welsh and Deptford for drawing young during the winter, also for transplanting in March for bulbing; *Radishes* and the various *Cresses* for autumn use; a little *Corn Salad*, and a little *Chervil*. Continue to plant *Endive* on elevated beds well manured; some of these should be so contrived as to admit of being covered with hoops and mats or other protection in winter. Let all forward *Onions* be laid immediately, in order to get them soon off the ground, which should then be manured and planted with *Colworts* in rows 15 inches apart, allowing 10 inches between the plants. Let the Marrow *Peas* have the best of sticks, and be sure to top

them when they reach the height of the sticks. If any of the *Parsley* is becoming too gross and forward, let a portion be mowed down at once; this is an old but a very excellent plan. A top-dressing of soot and dry soil, ashes, or sawdust, may be immediately applied. In this way fine young *Parsley* for garnishing will be produced by October. Dress *Tomatoes*, and see that all herbs are housed and the *Camomile* flowers picked when perfectly dry.

FRUIT GARDEN.

Proceed with thinning and nailing-in young shoots of all wall trees, if any remain unfinished. Peach trees, in particular, should now be kept closely nailed, in order that the wood may be ripened, and to admit air and light to the fruit. Remove a portion of the leaves where the fruit is too much shaded, and at the same time remove any nails with which it is likely to come in contact. If the weather is dry before the crop ripens, give the borders a good watering. Wash the trees occasionally, and trap earwigs; perhaps the easiest way is to place short pieces of beanstalks or other hollow stems in different parts of the trees, and look them over every second day, blowing the contents into a bottle and replacing the tubes as before. Protect with nets or canvas all ripe fruit intended for use late in the season, and net-up Currants and Gooseberries for late use. As soon as the crop of Strawberries is gathered, go over the beds and cut off all runners; fork the soil about the plants to encourage them to make a good growth before the growing season is past. Layer runners for new plantations. Use the garden engine occasionally in warm weather to prevent red spider.

FLOWER GARDEN.

Propagation by cuttings is now a most important business in this department. If time can possibly be spared, let there be no delay in this respect; not only mass flowers, but many in the mixed beds and borders, require to be annually propagated in order to insure their continuance. Such are sometimes termed imperfect perennials; as instances of these may be adduced such plants as *Pentstemon campanulatum* and its varieties, *Chelone barbata*, *Antirrhinum* in great variety, *Coreopsis lanceolata*, *C. auriculata*, and, better still, *C. grandiflora*. *Mimulus atroseus* also requires looking after, and deserves it. Many of these are old plants, but they are still useful in contributing to the general effect at least. Cuttings of *Pentstemon gentianoides* should be struck early; if well-established they will flower sooner than seedlings. The half-shrubby *Calceolarias* must be thought of, and such climbers as the *Maurandias*, the *Lophospermums*, and *Rhodochiton* should be well established in their store pots before winter. Intermediate Stocks may be sown for pots, and a little *Mignonette* in pots every week until the end of August. Let Rose-budding proceed, and for common purposes the old *Crimson Perpetual*, the *Bourbon Queen*, *Phoenix*, *Amosa*, *Lafayette*, *Aimée Vibert*, &c., are recommended. These, although not of the exhibition class, are nevertheless most useful about the pleasure grounds of a country seat. All the early layers of *Carnations* and *Picotees* will now be ready to take off. They may be potted singly in pint pots, and gently watered to settle the soil. When dry they should be put in a close cold frame for three or four days, till they have emitted fresh roots, when they may be gradually inured to the air. After the layers have taken root the pots should not be allowed to be drenched with wet, though they should be exposed to the air as much as possible. A good plan is to remove the pots, when ready, from the frame, placing them on a layer of coal ashes to prevent the ingress of worms, &c., and throwing a covering of calico over them when the weather is too hot, or during heavy rain. By these means they will be well established and hardened previous to being removed to their winter quarters. Continue to plant out *Pink pipings* when well rooted, shading and watering as occasion requires. Look well to the seed, which, with that of *Carnations* and *Picotees*, promises to be abundant. New or scarce sorts of *Dahlias* may be propagated by cuttings in a brisk heat. These make good pot roots. Trap earwigs by placing small pots half filled with dry moss on the tops of the sticks, and remove all imperfect buds as they appear. Attend to the preparation of the offset bed of *Tulips*, and regulate all small bulbs for planting.

GREENHOUSE AND CONSERVATORY.

No time should now be lost in putting all houses, pits, &c., in thorough repair. The glazing should be well seen to, and painting where needed. With regard to the interior of houses, the painting must ever depend on the crops. Whitewashing, however, can be managed at all times. The lime should have

abundance of sulphur mixed with it. No one need be afraid of using any amount on cool surfaces. The repairing and cleaning of flues will, of course, suggest itself, and the examination of boilers or other apparatus, where suspicion may rest, should be proceeded with forthwith. The end of August or early part of September is the most eligible time in the whole year to procure and carefully store loam and other materials necessary for special purposes during the next year. A good loam should be uniform in colour, rather tenacious, containing a fair proportion of fine and sharp sand, and somewhat unctuous when squeezed between the fingers. It should not, however, cake together too much on pressure. The more grass or other rank herbage it contains the better. It should be dug in a dry state, for if handled when wet its porosity, and consequently its power of transmitting moisture and air, will be in a considerable degree impaired. When removed to the compost yard it should be piled up in narrow ridges about 4 feet wide at the base, and as high as possible. If carefully placed the ridge will exclude much rain; it is, however, an excellent plan to place thatched portable hurdles against it, these may be removed in fine and settled weather for the purpose of air-giving. When it has been in the compost yard for a few months it will be found in excellent order for use, in fact, what gardeners term mellow. From the compost yard it should be removed to the potting shed in moderate quantities at a time, for if it lie too long there it becomes dry, and in this state it is not proper for compost. By the use of the thatched hurdles there need be no particular hurry in housing it; in doing this it should be cut down with a perpendicular face, and cleared thoroughly, in order that so precious a material may not be needlessly wasted. Give every attention to flowers for a late display. Everything intended for this purpose should be thoroughly established in the pot. Late shifting will never do here.

STOVE.

Take every means in due time to harden, or rather ripen, the growths already made. Give air very freely at all times, more especially when the atmosphere is warm, but shut up abundance of solar heat with a good amount of atmospheric moisture betimes in the afternoon.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

THE weather and the ground are so dry that planting-out is not to be thought of, except where water of some sort can be given. The sun on the 5th and 6th was as fierce and cloudless as ever. The amount of vapour raised must ere long give us clouds, and for these we shall be thankful. The dews in the morning have been our safety. The stems and leaves of plants were so filled and refreshed that they stood the sun pretty well. Water is now so scarce in this neighbourhood that it will be a great blessing if we be not visited with low fevers, &c., as in many cases working people can hardly find the means to secure cleanliness.

We sowed Turnips, Radishes, and Cauliflowers, and took up some forward Onions, to be followed by Cabbages; we also planted out winter stuff where we could give a little water at the roots. As to surface watering, that would be worse than useless. Plants well established will pump up moisture for themselves if left unwatered; puddle the surface, and you do little good, and for the time you deprive them of the supply from beneath. No common watering given at the surface in soil so dry as ours would have much chance of reaching the bulk of the roots. In different circumstances the treatment may be different.

At present, in these drying days our chief resources are *mulching* and shading. The breaking the surface of the mulching is next to giving a fresh layer. Our Celery beds would have been dried up but for shading. The Celery, as a ditch plant, likes a little shade in summer, even in ordinary seasons, and much more when it can have only a minimum of water in a season like this. What has often surprised us is the quickness with which a moderate mulching disappears. The earth, the air, and the roots together soon make short work of it. Where we could not well mulch, the surface of the soil has been frequently stirred with a Dutch hoe. As one proof of dryness, we may state that the walks in the pleasure ground have had scarcely a weed all the season, and we could only switch them to freshen them now and then. We have never had wet enough since March to consolidate them with a roller,

and without a certain amount of moisture beneath it is of little use to pass a roller over them.

FRUIT GARDEN.

What we have stated of mulching applies equally to fruit trees. Applied when the ground is warmed, besides excluding drought, its tendency is to entice the roots near the surface, and thus encourage fertility rather than over-luxuriance. We have gathered Joanneting and Red-streak Apples, but though clear fruit, they are small. With more moisture, the quantity as well as quality would have been good. As a great saving of water, we have mulched our fruit trees in pots with horse droppings previously allowed to heat. This is the third time this summer, and though each time mulched rather heavily, the mulching had all, or nearly all, disappeared before we repeated the dressing. As a saving to watering it is most effectual. To help us still more, though not looking so particularly neat, we mulched a good part of the floor. We did this all the more as the only water we could give was rather strong, and we were afraid to use it largely. We shall not here enter into the manurial question, though we feel convinced that even in this respect the roots get the benefit of the mulching. There is no question that it often saves the top of a plant when otherwise it would be dried up.

All at once, though scarcely seeing any wasps for the season, we have been attacked by myriads. Hives of bees have also made free with the best Gooseberries. The wasps threatened to make such a clearance of rather hard, though fine fruit of the late Florence Cherries, that we gathered them in self-defence. We shall have to use gauze, &c., to keep them from our best fruit in houses. Fine Peaches may be secured by means of a very thin layer of wadding, the paper side next the fruit, and the woolly side out. The wool baffles the wasps, as their legs become entangled in it. It is well to catch wasps early, but this year we hardly saw any all the season, and these were captured. Until within a few days we thought we were to be free of them for the season. They and ants, we fear, will speck the best Apricots. As to the *ants*, we should manage them if we could give soot and lime water, allowed to stand until as clear as brandy, and if a little guano were dissolved in it all the better, if the liquor were clear, as that would increase the smell of ammonia, which ants dislike. Well washing the trees from the top downwards would dislodge the ants and bring them to the ground; then a sprinkling of guano at the foot of the wall will generally succeed in making them decamp. If the ants are all brought to the ground, the most effectual means for preventing them going up again is to paint a cordon at the foot of the wall with tar and oil, say 2 or 3 inches wide. So long as the tar is moist and keeps its scent they will not pass it. A piece of wadding dipped in tar may be tied round the stem of the tree, and that will take away that ladder from them. Proceeded with potting Strawberries as detailed last week, and would have done more but for the scarcity of water. Many rather large plants must be given up, and smaller ones substituted. Many things have received less air and more shade than usual, in order to save the watering-pot.

ORNAMENTAL DEPARTMENT.

As yet the flower beds stand better than the Cabbages do, but the latter had no mulching except their own leaves. A few *Calceolarias* have succumbed, but not so many as to make vacancies. Nothing but the heavy dews in our case could have saved them.

Most of the *Verbenas* have succeeded well; that which has done worst—that is, stood the dryness worst with us, is the *Maonetti*, called also *Impératrice Joséphine*. Both as a broad edging and as a carpeting for beds it is just alive, but furnishing fewer of its pretty striped heads of flowers. Among the *Verbenas*, it seems to be as sensitive to dryness as the Black Prince Strawberry is among Strawberries. With a few showers and dull days this little favourite would still be fine. Another old favourite of ours, and which also used to be a favourite for groundwork with Mr. Robson—the little lilac *Verbena pulchella*—has thriven remarkably well, blooming profusely, and looking as fresh as a *Mesembryanthemum*. This fine old sort is not grown so generally as it ought to be. Its soft lilac-bluish colour gives a pleasant relief to more gaudy flowers. When fairly planted it generally looks after itself, running along the ground and rooting as it goes, without troubling one with pegging down. In fact, for the generality of plants, to save labour, we scarcely peg down anything; we would rather fasten and keep secure by twigs which the branches would cover, and depend for symmetry on the natural heights of the plants. Many a fine group is destroyed as respects symmetry

by neglecting to study the natural heights of the plants. Some time ago we saw a large bed of *Ageratum mexicanum* laid down and pegged so as to present a low flat surface. There were rests and planks laid across the bed, so that the men should properly do the work. The bed was solitary, or at least not in direct combination with others, and therefore there was no necessity obvious to the passer-by why the heads of the flowers of the *Ageratum* should be on a level with the grass, instead of 18 or 24 inches above it. As the bed would be some 18 feet in diameter, a bed showing from half to two-thirds of a globe in outline would have been much more telling, looked far more natural, and would have cost but a tithe of the labour. When such plants must be used in regular groups, there would be more excuse for pegging and tying down, but the desired end would in every way be better secured by at once using plants of the necessary height that would require no such torturing. Stopping and pegging must often be resorted to in the case of coloured plants used as edgings; for instance, *Perilla*, *Amaranthus*, *Iresine*, and *Cineraria maritima*, but even they always look best when there is little necessity for pruning or cutting them. Some massive lines of *Iresine* with us have never been touched, and they only want a little moist weather to make them look beautiful. We like to see *Iresine* best when bathed with dew.

We have commenced cuttings for the beds next season; will take a few *Verbenas*, *Heliotropes*, &c., first, and then will follow with variegated *Pelargoniums*. If we can manage we will place all, or as many as possible, in small shallow wooden boxes, so as to be easily moved, and they pack closer than pots. On an average, our cuttings will have from 1 to 1½ inch each, and will be small, to take up little room in winter.

We have had a busy week potting and overhauling Ferns; for drainage and mixing we used a good deal of charcoal, and as we were scarce of it we made a few barrowloads by the quick and handy process we lately detailed. We were rather anxious that our readers would guess what the *Coleus* bed at Woburn was edged with, as we might have gained some new idea; but we find that to prevent many inquiries we may as well state at once that the edging consists of a double row, from 16 to 18 inches wide, of the *Polemonium caruleum* variegatum. There was hardly a leaf of the *Polemonium*, except a few central ones, that would not average fully 9 inches in length, and beautifully coloured and marked. We have seen and tried a great many plants in combination with the *Coleus*, but such fine-leaved plants of this *Polemonium* seemed to leave everything else we have seen far behind.—R. F.

TO CORRESPONDENTS.

. We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

BOOKS (*Mr. P., Salisbury*).—You will find a treatise on Vines in pots in the "Vine Manual," which can be had from our office by post for thirty-two stamps. (*Prudence*).—"Greenhouses for the Many" will give you the instruction you require for erecting a greenhouse, and "Flower Garden Plans" will furnish the other information you ask for. The former can be had from our office, free by post, for seven postage stamps, the latter for 5s. 5d.

RENANTHERA LOWII.—In page 85 the quotation is from the "Botanical Magazine" for 1864, not 1864.

GARDENERS' EXAMINATIONS (*Jos. Bowker*).—Apply to Mr. Richards, Royal Horticultural Society, South Kensington, W., and he will supply you with the information.

CARNATIONS (*Old Subscriber*).—We cannot recommend tradesmen. Any of the leading florists who advertise in our columns will be able to supply you.

VINEGAR PLANT (*J. G., Chester*).—This is the mycelium of a mould, *Penicillium glaucum*, found on liquids undergoing acetous fermentation. We do not know where it can be obtained. The Fern is *Scelopendrium vulgare* ramo-ferosum.

ARACARIA IMBRICATA (*W. R.*).—It has frequently produced cones and seeds at Bicton, and in other gardens, but such an occurrence cannot be said to be common.

SELECT HARDY ROSES FOR STANDARDS (*J. W. Boyd*).—Gloire de Dijon, orange yellow; Cécile Forestier, bright yellow; Pierre Notting, rich dark crimson purple; Jules Margottin, cerise pink; Baronne Prevost, rose; Baronne de Maynard, lovely white; Maurice Bernardin, rich vermilion; Marguerite de St. Amand, pink flesh; William Griffiths, salmon pink; and Charles Lefebvre, rich crimson. I should buy new plants. The only really fit land for Briar Roses is rich land with 20 per cent. of rich clay in it. For inferior soils the Manetti stock is the best.—W. F. RADCLIFFE.

ROSES NOT SUCCEEDING (*C.*).—It has been a very trying season for Roses. I should stir the surface of the ground and water the plants well. September is a good month for rooting. You ought not to have cut down your plants so late as September. The wood made after that time could not have been sufficiently matured to stand well so severe a winter, followed by a late cold spring. If you cut down your Manetti plants or Roses on their own roots, it should be done in the spring. If you wish to remove them, it must be done cautiously, as you will disturb and perhaps injure the new rootlets. If your land is wet and needs draining, you had better take up the plants and trench the ground.—W. F. RADCLIFFE.

EXHIBITING ROSES (*Inquirer*).—A single bloom of a Rose is certainly not a truss, and the committee of the show must clearly have understood so, otherwise why did they specify one class to be shown as "one bloom each," and the other "one truss of each?" The only wonder is that any doubt should have arisen on the subject.

ROSES LADY SUFFIELD AND FELIX GENERO (*Q.*).—I cannot tell the weight of the Strawberry which measured 1½ inches in circumference. Lady Suffield is a beautiful and successful Rose, raised by Mr. William Paul, of Waltham Cross. I am glad you agree in admiring Felix Genero. Mr. Taylor, of Fencote, Yorkshire, wrote on June 30th.—"Felix Genero is quite extra, but it was raised by Damazin, and not by Lacharme, as you said." Since "D." of Deal, left here on July 16th, he visited Mr. Keyes's nursery, and wrote—"I saw many specimens of Felix Genero, and they were very good." I spoke of the Rose on the Manetti stock.—W. F. RADCLIFFE.

LONG SHOOTS ON ROSES (*Frank Wilson*).—We cut back all our Hybrid Perpetual Roses after flowering, shortening the flowering shoots to within five or six joints of their bases, and the long shoots we cut back about half their length, or shoots of 4 feet we reduce to 2 feet, and in this way we keep the plants compact, and have flowers in autumn, with the wood well ripened at its base. We should cut the shoots back about half their length at once. There is no good in a shoot 4 feet long reduced three-fourths at the winter pruning, all the best buds are cut away, the worst retained. Dwarf Roses should be planted 3 feet apart every way. Bones are first-rate manure for Roses, whether applied in the form of half-inch bones, or as dust. Of hair we have no experience, but do not see why it should not be a valuable fertiliser.

MAKING VINE BORDERS AND PLANTING THEM (*P. P.*).—The beginning of July is the best time for planting Vines, as they have then time to become established before winter. After August is too late, we would then prefer planting in spring. We should likewise prefer leaving the making of the border until then, as if it is made now the soil will become considerably solidified, if not soddened, before spring, and the Vine roots will, consequently, not take so readily with it.

GONIOPHLEBUM APPENDICULATUM (*T. H. V.*).—We should not consider this a variegated Fern. Though it has distinct reddish veins and minute spots on the pinnae, yet it is no more variegated than some others, as *Blechnum corcovadense*. To be variegated, the plant should not only have more than one shade of coloring, but the markings must be distinct, as in *Pteris argyrea*, *P. tricolor*, &c.

GARDENIA PROPAGATION (*C. A. G.*).—Take cuttings now from the shoots of the current year, or those that have growing points, and with the base rather firm, or what is termed half ripe; insert them in a pot well drained and filled to within an inch of the rim with silver sand and sandy peat in equal parts, and to the rim with silver sand. Place them in a bottom heat of from 70° to 75°, and in a corresponding top heat, and keep them moist and shaded from bright sun. They will be well rooted in about six weeks, when they should be potted off singly, and again placed in bottom heat until established.

CANNA SEEDS NOT GERMINATING (*Caroline*).—The seeds sent to us of *Canna indica* coccinea we believe are sound and will yet vegetate. Soak the seeds for twelve hours in water at a temperature of 125°, and then sow them in light soil, placing the pots in a bottom heat of not less than 70°, and not more than 90°. The seeds are best sown in spring, and then the young plants can be forwarded so as to become good plants before autumn. If you sow now it will be necessary to winter the plants in a house where there is a good heat, a light airy position in a stove being most suitable. We remember the time when they were grown as stove plants.

PRODUCE OF FORCED STRAWBERRIES—STEPHANOTIS FLORIBUNDA CULTURE (*Inquirer*).—We have seldom weighed the general produce, but from 3 to 6 ozs. would be a fair average crop for good plants of Strawberries in 6-inch (32-sized) pots, from March to April. Frequently we must be satisfied with less, sometimes we obtain more. Cnt flowers of *Stephanotis floribunda* are generally in demand, but as we have seen the roofs of houses covered with it, we are not so sure of their being the most profitable flowers. It is best trained about 15 inches from the glass, and grown in a large tub or platted out. If a little heat can be given to the roots all the better. We do not think you will do much good with it in any way in a house intended for Vines or Peaches, as these must have a cooler resting period than will suit it. A medium stove heat suits it best.

BORDER OF SPRING-FLOWERING PLANTS (*L. H. M.*).—You do not tell us how your border is surrounded, a matter of some importance. One of the simplest arrangements with seeds for early work would be to sow the diamonds with blue *Nemophila insignis*, and the triangles opposite each other with pink and white *Virginia* Stocks. These would not last long, but they would make a fine display early. If your position is damp, the common, also the alpine *Forget-me-not*, especially the latter, would make a fine display early. We do not undertake to plant beds and borders, we only advise and criticise. Such a border would look well filled with three colours of *Daisies*, also with three colours of *Pansies* or *Heartsease*.

WINIFERING CALADIUMS (*W. L.*).—After the foliage is withered shake out the tubers, and pack them in sand in a box, being careful not to injure the outer skin. They ought not to be packed so closely together as to touch. Keep them in the warmest part of the stove; indeed, they require a winter temperature of from 60° to 65°. They should not be kept dust dry, but are the better of slight moisture, though the soil is to every appearance dry. If you had room we should prefer keeping them in the pots.

APHIS ON CABBAGES (*James Levesque*).—We have found dusting the plants with quicklime very beneficial, and that we are now practising with ours very successfully. Dusting with tobacco powder is more efficacious, and so is sprinkling overhead with tobacco water, that of the

shops being diluted with six times its bulk of water. Various insect-destrory compounds are also used successfully.

MANURING ROSES (A. B. A.).—We should, in November, give a good mulching over the dressing of manure, which may be 2 or 3 inches thick, and a few inches of dry litter would keep all safe from frost. Every winter we have our Rose beds mulched nearly a foot thick, and we never knew an eye decay. In spring remove the loose portion of the litter, and point the manure neatly in with a fork. There is no necessity to go so deep as to interfere with the roots. Liquid manure is very serviceable when plants are growing, but not when the plants are at rest, and is not to be recommended in preference to manure in a solid state. Both are useful.

FORMING RHODODENDRON BEDS (Idem).—The soil where the beds are to be made should be taken out to a depth of 2 feet, and the space filled with the sandy soil and the peat from the meadow in about equal proportions. The peat is best used fresh, but that exposed to the atmosphere during the summer will answer very well. The ground should be drained, for if stagnant water lodge in the soil even American plants, which delight in moisture, will not thrive. The peat should be chopped up, but need not be made very fine.

FORMING A LAWN (Idem).—Turf being scarce, you may sow grass seeds instead. Fill up all holes and take down the hillocks, so as to form an even surface, and dig or trench the ground so as to give the turf or grass seeds a chance of growing, becoming established, and making an uniform growth throughout. For your soil we advise *Festuca duriuscula*, 3 lbs.; *Cynosurus cristatus*, 6 lbs.; *Festuca tenuifolia*, 3 lbs.; *Poa nemoralis*, 2 lbs.; *Poa trivialis*, 2 lbs.; *Festuca ovina*, 4 lbs.; *Lotus corniculatus*, 1 lb.; and *Lolium perenne* tenne, 24 lbs., in mixture for one acre. You may sow this mixture in September, the ground being in good tilth and free of weeds, especially Dock, Dandelion, Plantain, Yarrow, and Couch. The finer the surface the better for the seeds. Roll well after sowing. If the ground is not in good order do not sow until next April. Your Carnation we shall notice next week.

HEATING A SMALL GREENHOUSE (Q. Q.).—Your case is just one of those frequently referred to by Mr. Fish. As the house is 21 feet by 15, one of the best arrangements would be a narrow platform all round, except at the doors, a walk all round, and a platform and stage in the centre. Then you could place your furnace deep enough at the most convenient corner, and take your flue all round, or round three sides, but sunk so that the top of the flue would form part of the pathway. By this mode you would have no difficulty with your doorways, as the flue would be beneath their level. You would have also a pleasant pathway in cold weather. Your having to raise the chimney 8 or 10 feet would make the flue draw all the better. (C. Y. C., *Bedford*).—You do not give us sufficient data, especially as to levels, to enable us to help you. We do not think tank-heating would suit you as to expense, nor yet as to the doorways, as the tanks must be level. Then we have no idea how the level of the chimneys in the hall and the drawing-room agree with the level in the greenhouse. It is very difficult to make heat descend; it has a natural tendency to rise. There are exceptions; for instance, in a large parlour we lately saw an iron stove in the middle of the room with an open grate, but a close bevelled top, and underneath that an opening for the smoke to go down, which it did beneath the floor, and also beneath the floor of a large kitchen, but then the smoke flue terminated in a high kitchen chimney, and the draught was the cause of excess. It was here altogether an exceptional case. It is always expensive to heat such houses as yours, 11 feet by 14 feet, by hot water, if the apparatus has to be erected on purpose. Then there is an objection to a chimney being seen; and, again, there are the doorways in the greenhouse. If in the hall chimney you could fix a little boiler, so that the top of it should be about 6 inches below the level of the floor in the hall, and at least as low as the floor in the greenhouse, then you could cross the floor of the hall under the level, and have the pipes above the floor in the greenhouse, entering on the hall side, going as far as the doorway on the west side, and returning. If you could sink low enough under that hall chimney, you might take a flue from it all round the greenhouse under the floor level, and let it terminate at the chimney above the furnace. Again, if you could make a small furnace outside on the west side near the doorway, you might also have a small flue below the floor level, crossing the hall into the chimney. If none of these suit, the simplest plan would be to have a metal stove, with a flat top to receive an evaporating basin, and take a 4-inch pipe from it outside the roof of the greenhouse. The stove will be rarely wanted from April to the middle of October. Is there an kitchen not so far off on a lower level than the greenhouse, from which you could borrow heat? Level in these matters cannot be disregarded.

MILDEW ON PEAS (Mrs. H. Thring).—The way to prevent Peas becoming mildew, is to give them copious supplies of water.

BERBERIS NOT FLOWERING (Norwood).—The plants will flower as soon as they are old enough, if not interfered with.

DISCOLOR (R. G.).—This word is applied to parts having one surface of one colour, and the other of another colour; also to green altered by a mixture of purple. The leaves of *Cissus discolor* are green mottled with white on the upper surface, and purplish red beneath: hence the application of the word. Tricolor, as applied to variegated zonal Pelargoniums, has before been objected to, but it is sanctioned by use, and generally understood, and the leaves of such Pelargoniums contain three colours in various degrees of intensity.

CABBAGE CATERPILLARS (Subscriber).—Those you complain of appear to be the larvae of *Pontia brassicae*, for which hand-picking is the remedy.

PLANTS FOR EXHIBITION (C. R.).—We should decidedly prefer the Fern.

WASPS.—“J. P. H.” says that he has noticed for years that however abundant wasps are throughout England, it is a very unusual thing to meet with one in the town of Southampton. It cannot be on account of the sea air, as he has noticed in other seaport towns the grocers' and other windows full of wasps at this season.” If Southampton is so exempt, we can assign no valid cause; but we remember the story of Charles II. and the Royal Society.

INSECTS (E. S. P., jun.).—The best seen are *Andrena pilipes*, one of the solitary nest-making species. The smaller ones are the males, which, like all male insects, are destitute of a stung. (J. H.).—Your Cherry leaves are infested with the slimy larvæ of a small black-winged species

of saw-fly, *Selandria æthiops*. They may be killed with dusted lime or lime-water. (E. S., *Liverpool*).—Your Ash trees are attacked by the small and not-uncommon little beetle named *Hylesinus Fraxini*. Its habits are quite like those of the *Scolytus destructor* which attacks the Elm, the female depositing her eggs in the bark, and the young larvæ burrowing into the inner bark. If very numerous the trees might be partially barked, the bark being burnt.—I. O. W.

NAMES OF FRUIT (Sir Percy Burrell).—The Plum is evidently a wilding, and not referable to any cultivated variety.

NAMES OF PLANTS (Château Vallon).—We cannot say exactly what your plant is from the leaf only, but suppose it to be some Anthemoid Composite, some ally of the Feverfew. Cannot you send us a flower? (J. G. S.).—1, *Veronica Teucrium*; 2, 4, 5, 6, *V. longifolia* and its varieties, differing only in colour or variegation; 3, *V. gentianoides variegata*; 3, Some species of *Teucrium*, send when in flower; 7, *Pentstemon glaucum*. (Subscriber).—1, *Rhus Cotinus*; 2, *Hypericum chinense*; 3, *Geranium sanguineum*. (Tyro).—Apparently *Achusa sempervirens*. (Grave).—One of your shrubs (that in fruit) is *Rhamnus Frangula*, the other is very doubtful, probably some *Prunus*; send a better specimen, if possible, in flower or fruit. (A Constant Reader).—1, A narrow-leaved variety of Sweet Bay, *Laurus nobilis*; 2, We suppose it to be some *Acacia*, but do not recognise it. (R. Jameson, *Gargrave*).—*Ornithogalum alliacum* (Short Grass)—*Bromus secalinus*. The idea of its being degenerated Oats is, we find, widely spread, but is utterly unfounded; a like fallacy in supposing *Lolium temulentum* to be degenerated Wheat also prevails. (S. Brierley).—Seeding state of *Pteris aquilina*. (*Amateur*). *Colutea arborescens*.

POULTRY, BEE, AND PIGEON CHRONICLE.

PREVENTION OF FRAUDULENT PRACTICES AT POULTRY AND BIRD SHOWS.

The process of incubation being completed, and the admonition not to study one of the simple rules of arithmetic as applied to poultry being removed, breeders will be legitimately engaged in counting their chickens.

In prospect of the approaching exhibition season, let me take time by the forelock, and call the attention of committees to the importance of legislating on the above question. Much has been said about it, and many suggestions made with a view to putting a stop to the dishonest (there is only one word for it) practices of certain exhibitors. I cannot now refer to the articles, for though I have the index to the last volume of the Journal, unfortunately that is all I have, as I either give away my weekly numbers, or lend them, which amounts to the same in the end. But if my memory serves me correctly, nobody seems to have prescribed a specific for this loathsome form of moral disease, while those who do recommend some mild kind of medicine, either do it as if with a desire not to hurt the sensitive feelings of their patients, or administer it in such a way that its effects are not felt. Cautions and hints are only gentle aperients, and the disease can only be met by strong purgatives.

One correspondent, taking what I think is a correct view of the matter, suggested that action should commence with the committee of management, and said he should hail with satisfaction the appearance of a schedule with atringent rules affecting the subject under consideration. A prize list with regulations worded in general terms, implying that specimens must be shown honestly, is issued, but no special punishment for an infringement of this necessary requirement is attached. On this head all is vague, and in many cases the extreme penalty is the disqualification of the single pen or specimen in the quietest manner possible, not to alarm intending purchasers, and so spoil the market, and when any disagreeable work has to be done, the judge is expected to take it on his shoulders. It is no part of his office. When any case of more than ordinary barefaced impudence occurs, when a manufactured bird appears in borrowed plumes, or minus his surplus plumage, or daubed up to such an extent that the paint “comes off in lumps,” as I once heard it remarked, then comes the cry that the judge ought to do this, and the judge ought to do that, and the judge ought to do the other thing. It is quite a mistake. The judge should do nothing of the sort. It is his duty to award prizes and detect frauds, and nothing else. He has no right even to put “disqualified” on a pen, or as much as to mark with his pencil a card or a label. His awards and remarks should be handed in to the committee, and it is for them to inflict the punishment which the rules say shall be inflicted. Then let the rules be stringent. It is the pusillanimity of committees which alone is to blame for the demoralised state of things existing in our shows unchecked, which allows exhibitors convicted of fraudulent doings still to carry on their nefarious trade in the most unblushing manner, and I grieve to say, that in discussion with men in whom I might have expected to find a higher tone of exhibitionising morality, I have

discovered a mental obliquity most painful to witness, a disposition to shirk the question, and an implicit belief in the shuffling creed, that two wrongs make one right.

I would therefore urge on all committees to revise their rules, or rather those relating to fraudulent practices and the penalties thereunto attaching; and if they be really anxious to root out dishonesty and expunge the names of dishonest men from their catalogues, let them enact such laws as shall be a terror to evil-doers, and which will practically have the effect of driving them from the exhibition field, nailing them up against the gable ends of our catalogues and reports as the stoats and polecats of the hen-roost. It is useless winking at any malpractices, or trying to gloss them over—pull them up by the roots. A time-serving policy is always a self-defeating policy.

In our rules (North of England Ornithological Association, Sunderland), we have the following—"Any bird with clipped, drawn, or artificially coloured plumage shall be excluded, and the owner of such bird shall forfeit all entrance fees, and shall be disqualified from taking a prize at this or any future shows of the Association." We issued this in 1866, and have found it work well. But with the object of still further checking the evil the rule will be made still more comprehensive in its grasp, including all who shall at any time have been convicted of such practices at any public show. The published report of such delinquency, or a notification from an accredited secretary or official authority, will be deemed sufficient reason for such exclusion; while the option of accepting or refusing any entry will enable us to deal very summarily with cases of suspected *bonâ fide* ownership. We shall do this or give up shows entirely, for we will never consent to their existence if connection with chicanery and knavery be the conditions.

The result of my own observation as a judge, and my experience as a breeder, is that perfection (in the department I represent) is in many classes a much scarcer article than is supposed, and exists really in a much less degree than is apparently presented to us at shows. Translate that into plain Saxon. It is to induce an honest exhibition of the nearest approximation to perfection that the legislation of our committees should tend, that we may know when we are looking at any bird that what we see is, and not that it is not.—W. A. BLAKSTON.

TESTIMONIAL TO MR. R. FULTON.

It will be in the recollection of many of your readers that at the exhibition of Pigeons held at Glasgow in December, 1869, when the contest for the grand challenge cup was decided, some birds exhibited by Mr. Fulton were by some unaccountable means transposed to the pens belonging to his principal opponent, who thereby received the points really gained by Mr. Fulton's birds. This, in the opinion of some fanciers, materially affected the position of the competitors, and some of Mr. Fulton's friends being of opinion that the cup should have been finally awarded to him, have, in order to testify to his thoroughly upright conduct, and their opinion he had been somewhat harshly treated, subscribed for and presented to him a duplicate of the original. The cup is of very handsome design, and an exact fac-simile, excepting that the figure of a Pouter on the cover and the stand itself is, as well as the body of the cup, of silver, instead of being plated like the original.

The presentation took place in the presence of several of Mr. Fulton's friends, who warmly congratulated him upon the position he has attained amongst fanciers generally by his strict integrity and straightforward dealings. Amongst the subscribers were Messrs. F. Crossley, G. Ure, F. T. Wiltshire, J. Ford, G. Chapman, and other English and Scotch fanciers.—J. FORD, Treasurer.

CLITHEROE POULTRY SHOW.

The following are the awards made at the above Show, held August 6th:—

GAME.—1 and 2, F. & C. Haworth, Newfield, Haslingden. **COCK.**—1, F. & C. Haworth. 2, Messrs. Eastwood & Hinde, Accrington. *Any other Variety.*—1, F. & C. Haworth. 2, W. Robinson, Clitheroe. 1 and 2, T. Briden, Earby, Skipton. **COCHINS.**—*Buff or Cinnamon.*—1 and 2, T. Seed, Bay-hall Town, Clitheroe. *Any Variety.*—1, G. Anderson, Accrington. 2, H. Smalley, Grindleton, Clitheroe. **SPANISH.**—1, F. & C. Haworth. 2, H. Wilkinson, Earby, Skipton. **BRAMA.**—1, F. & C. Haworth. 2, G. Anderson. **HAMBURGS.**—*Golden-pencilled.*—1, B. Bee, Gossnarth. 2, H. Pickles, jun., Earby, Skipton. *Silver-pencilled.*—1, B. Bee. 2, H. Pickles, jun. *Golden-spangled.*—1, H. Pickles. *Silver-spangled.*—1, H. Pickles. 2, J. Cronshaw, Accrington. **BLACK.**—1, F. & C. Haworth. 2, B. Bee. **POLAND.**—1, H. Pickles. **GREY BANTAMS.**—1, T. Barker, Hill End, Burnley. 2, N. H. Ellis, Accrington. **COCK.**—1, Harwood & Buckley, Accrington. 2, Bellingham & Gill, Burnley. **TRUMPETERS.**—1, J. Houlker, Blackburn. **GESE.**—1, J. Houlker. 2, T. Bank, Waddington.

DUCKS.—*Aylesbury.*—1, H. Deane, Whalley. 2, J. Snaith, Clitheroe. *Rouen.*—1, J. Houlker. *Any Variety.*—1, F. & C. Haworth.

PIGEONS.

CARRIERS.—1, L. Byrom, Blackburn. 2, J. Ashworth, Blackburn. **TUMBLERS.**—1 and 2, Bellingham & Gill, Burnley. **BARBS.**—1 and 2, J. Hamilton, Haslingden. **OWLS.**—1, W. Buckley, Blackburn. 2, J. W. Brade, Blackburn. **POUTERS OR CROPPERS.**—1, Bellingham & Gill. **FAN-TAILS.**—1 and 2, J. Kemp, Haslingden. **TURKITS.**—1, J. Kemp. 2, F. Moore, Burnley. **DRAGONS.**—1 and 2, J. Ashworth. **TRUMPETERS.**—1 and 2, Bellingham & Gill. **ANY OTHER VARIETY.**—1, Bellingham & Gill. 2, J. Hiley, Accrington.

RABBITS.—*Spanish.*—1, J. Boyle, jun., Blackburn. 2, J. Irving, Park Gates, Blackburn. *Any other Variety.*—1, J. Boyle, jun. (Silver-Grey). 2, A. L. Lawstron, Haslingden (Himalayan).

JUDGES.—Mr. T. Wareing, of Preston, and Mr. Thompson, of Halifax.

(From a Correspondent.)

THE Rabbits were quite a success, considering there were only two classes, and that the prizes were so small, the first prize being only 10s., the second 5s. The first prize was awarded to a Black and White buck belonging to Mr. Boyle, jun., a very fine specimen; the second prize to a Tortoiseshell buck belonging to Mr. J. Irving, a first-class Rabbit, but in poor condition. There were five pens in this class, and some really good Lops. The "Any other variety" class had nine entries, and all but one put in an appearance. The first prize was awarded to Mr. Boyle's Silver-Grey buck, decidedly the best in the class, a beautifully silvered Rabbit. The second prize went to a Himalayan buck, very dark in all points, but spoiled with a white streak on his nose, a fine Rabbit but for that fault.

Taking the Rabbits on the whole there was a first-class show, which ought to encourage the Committee to offer at least four classes for the future. The management was anything but good; part of the Rabbit pens were among the cats, and the other part among the Pigeons, 20 yards off. They were viewed by crowds of people throughout the day.

ALLERTON POULTRY SHOW.

THIS Show, which has attained a leading position among the Yorkshire exhibitions, was held on the 6th inst., and was a complete success as regards arrangements, number of entries, and number of visitors. The poultry pens were arranged in a square with the Pigeon pens along the centre. The pens were from Turner, and were purchased for the occasion; their appearance was very pretty.

Many of the adult *Game* were much out of feather, but the pen to which the cup was given was in good bloom and consisted of Brown Reds. *Spanish* were good, but not numerous. The first-prize *Cochins* were White, and of excellent quality. *Polands* were very fine, and the *French* fowls unusually good. The single *Hamburgh* cocks were in full plumage, and excellent in marking. The cup for *Hamburghs* was won by Golden-pencilled of extraordinary colour and quality for the time of year. The *Bantam* classes were not well filled, but there were some well-shaped birds.

The chickens were scarcely so numerous as we have seen them at this Show, and were as a rule rather backward in feather. This remark applies particularly to the *Game* classes. The *Hamburghs* were the best classes of young birds, although Mr. Sidwick sent two excellent pens of *Cochins*; the first prize birds were *Buffs*, and the second-prize birds *Partridge*. The first-prize *Black Red Game* cockerel was of extraordinary quality, but the second-prize bird was most decidedly one of last year.

Of *Pigeons* there were some excellent birds. Mr. Hawley had the best position for *Pouters*, and Mr. Horner for *Carriers*. The first-prize *Red Mottled Tumblers* were little gems, and the second-prize *Almonds* also good in point of feather. The *Turkit* class was large, and many more prizes might have been given to deserving pens. The first prize went to *Blacks* of perfect colour, the second to *Blues*, and the third to *Reds*. *Jacobins* were *Red* and *Black*, the latter losing only in the length of face. *Fan-tails* were moderately good, but the first-prize pair rather dirty. The *Barb* class contained such birds as are rarely seen, though some of those left out of the prize list were exceedingly high in colour of eye wattle. The *Trumpeters* were good, the *Nans* neat, and the *Antwerps* the most extraordinary class; five prizes were awarded and several high commendations. In *Magpies* the birds were most beautiful in colour and marking, though we regret to say that one of the principal exhibitors did not scruple to exhibit his expertness in the trimming department before the very eyes of the public. In the "Any other Variety" class the first were *Porcelain Swallows*, the second *Reds*, and the third a fine pair of *Silver Runts*. In the *Selling* Class the winners were a splendid pair of pure *Silver Dragons*, *Red Barbs*, and *Black Trumpeters*.

There were some excellent *Rabbits*, the best of which were, however, left out on account of only one being sent in place of pairs. The cup offered to the exhibitor of Pigeons gaining the greatest value in prizes was won by Mr. J. Hawley, of Bingley.

GAME.—*Cock.*—1, E. Aykroyd, Eccleshill. 2, W. Bentley, Allerton. 3, E. Wood, Worcester. *Hen.*—1, J. Hodgson, Bradford. 2, J. Spencer, Clayton. 3, R. C. & W. J. Mason, Drighlington. *hc.* W. Spencer, Haworth; E. Aykroyd. **RED**—1 and Cup, E. Aykroyd. 2, J. Sunderland, Halifax. *Any other Variety.*—1, H. Jowett, Idle. 2, E. Aykroyd. 3, J. Sunderland. **SPANISH** (Black)—1 and 2, H. Beldon, Gofstock. 3, J. Powell, Bradford. **COCHIN-CHINA.**—1, J. Siebel, Timperley. 2, H. Beldon. 3, J. H. Dawes, Birmingham. *hc.* G. Fletcher, Didsbury. **POLANDS.**—1, 2, and 3, H. Beldon. **DORINGS.**—1, Hon. H. Fitzwilliam, Wentworth Woodhouse. **BRAMA** **POULTRY.**—1, W. Whiteley

Sheffield. 2 E. Leech, Rochdale. 3 J. Siebel. *hc*, H. Beldon. *FRENCH FOWLS*.—1, H. Beldon. 2, Hon. C. W. Fitzwilliam. 3, Hon. H. W. Fitzwilliam. *hc*, J. J. Malden, Biggleswade. *HAMBURGERS*.—*Cocks*.—1, H. Beldon. 2, W. Driver, Keighley. 3, A. Driver, Keighley. *hc*, H. Beldon. *H. PICLES*, jun. *Gold-pencilled*.—1, G. E. Newton. 2, H. Beldon. *hc*, H. Picles, jun. 2, H. Picles, jun. *Silver-spangled*.—1 and 3, H. Beldon. 2 and 4, *hc*, H. Picles, jun. *Gold-pencilled*.—1, 3, and Cup, H. Beldon. 2, H. Picles, jun. *Silver-pencilled*.—1 and *hc*, H. Picles, jun. 2 and 3, H. Beldon. *Black*.—1, H. Beldon. 2, H. W. Hingworth, Idle, near Leeds. 3, T. Walker, Denton, near Manchester. *hc*, H. W. Hingworth. C. Sidgwick, Ryddlesden Hall, Keighley. *BANTAMS*.—*Game*.—Cup, W. F. Entwisle. 2, G. Noble, Staincliffe, Dewsbury. *Cock*.—1, W. F. Entwisle, Westfield, near Cleckheaton. 2, W. Bravay, Bradford. 3, W. Bailey, Greenfield, near Halifax. *Game*, *any other Variety*.—1, W. F. Entwisle. *Any other Variety*.—1, J. Walker, Halifax. 2, J. W. Cannon, Bradford. 3, J. Pearson, Hill Top, Allerton. *hc*, H. Beldon. 3 and R. Ashton, Mottram, Cheshire. *ANY OTHER VARIETY*.—1, R. Loft, Woodmans, near Beverley. *DUCKS*.—*Roan*.—1, E. Leech. 2, J. Crosland, Huddersfield. 3, W. Bentley, Greasdale, Allerton. *hc*, J. White, Whitby, Netherton. *Any other Variety*.—1, E. Leech. 2, W. Willing, Farhill, Kildwick. *Ducklings*.—1 and 2, E. Leech. 3, J. Dove. *SELLING CLASS*.—1, J. J. Booth, Silsden. 2, J. Bailey, Earsby. 3, R. Loft. *hc*, H. Beldon. c, J. Berry, Silsden.

CHICKENS.

GAME.—*Cockerel*.—1, J. Carlisle, Earsby. 2, J. Mason, Worcester. 3, T. Dyson, Halifax. *hc*, J. Fortune. E. Lund, Morton Banks. *Pullet*.—1, J. Carlisle. 2, J. Harker, Heaton. 3, W. H. Green, Queensbury. *hc*, W. Spencer, Haworth; J. Pearson, Allerton; H. C. & W. J. Mason. c, W. Drake, Allerton. *Red*.—1, W. Spencer. 2, J. Brown. 3, J. Smith. *Any other Variety*.—1, M. Jowett, Clayton. 2, J. Mitchell, Birmingham. 3, H. Jowett. *COCHIN*.—1 and 2, C. Sidgwick, Keighley. 3, J. Dove, Moulton. *HAMBURGERS*.—*Gold-spangled*.—1, J. Andrew, Ashton-under-Lyne. 2, W. Driver. 3, T. Walker. *Silver-spangled*.—1, H. Beldon, Bingley. 2, H. Picles, jun. 3, J. Rhodes, Harden. *hc*, C. Smith. *Gold-pencilled*.—1, H. Picles, jun. 2, H. Beldon. 3, T. Wrigley, jun., Tongre Hall, Middleton. *Silver-pencilled*.—1, H. Beldon. 2 and 3, H. Picles, *hc*, H. Picles; T. Hanson, Keighley. c, T. Hanson. *Black*.—1, J. Cockerell, Keighley. 2 and 3, C. Sidgwick. *BANTAMS*.—*Game*.—1, W. F. Entwisle. 2 and *hc*, F. Steel, Halifax. 3, G. Noble, Staincliffe. *Any other Variety*.—1, H. Beldon. 2, T. Dyson. 3, W. F. Entwisle. *hc*, S. and R. Ashton, Mottram; W. Clayton.

PIGEONS.

POUTERS OR CROPPERS.—1 and 2, J. Hawley, Bingley. 3, J. T. Lishman, Gillington. *CARRIERS*.—1, 2, and 3, E. Horner, Harewood. c, S. Smith, Idle. *TUMBLERS*.—*Short-faced*.—1 and 3, J. Hawley. 2, E. Horner. *hc*, F. Graham, Birkenhead. *Any other Variety*.—1 and 2, J. Hawley. 3, E. Horner. *hc*, Clayton and Birstow. *GIRLINGTON OWLS*.—1, H. Yardley, Birmingham. 2, J. W. Cannon, Bradford. 3, J. Hawley. *hc*, J. Hawley; S. Smith, Idle; E. Horner. *TURBITS*.—1, E. Horner. 2, A. Child, Idle. 3, Foster, Pennington Gate. *hc*, E. Hingworth, Allerton. c, C. Sazden, Wilsden; E. Horner. *JACOBS*.—1 and 2, J. Hawley. 3, J. W. Cannon. *hc*, J. T. Lishman; J. Crosland; E. Horner. *FANTAILS*.—1, H. Yardley. 2, E. Horner. 3, C. Sazden. *hc*, J. Hawley; E. Horner. c, F. Graham. *BARDS*.—1, E. Horner. 2, J. W. Cannon. 3, H. Yardley. *hc*, J. Crosland. *DRAGONS*.—1 and 2, F. Graham. 3, J. Hawley, Bingley. c, J. T. Lishman; J. Hawley. *TRUMPETERS*.—1, J. Hawley. 2, E. Horner. 3, J. Crosland. *NEWS*.—1, F. Graham. 2 and 3, H. Yardley. *hc*, J. T. Lishman. *ANTWEERS*.—1, J. P. Lishman. 2, E. Horner. 3, J. Hawley. c, J. Crosland. 5, W. Lund, Shipley. *hc*, J. A. Collinson, Halifax; J. Hawley. J. Oldroyd, Wakefield; R. Sidgwick; Clayton & Birstow; E. Horner. *MAGPIES*.—1 and 2, J. T. Lishman. 3, E. Horner. *hc*, A. H. Easton, Hull; J. Crosland; E. Horner. 2, 3. *ARCHANGELS*.—1, H. Yardley. 2, E. Horner. 3, S. Smith. *ANY OTHER VARIETY*.—1, J. T. Lishman. 2, E. Horner. 3, S. Smith. *hc*, H. Yardley; J. T. Lishman; J. Hawley; E. Horner. *SELLING CLASS*.—1, Clayton and Birstow. 2, J. Hawley. 3, Sazden. *hc*, J. T. Lishman (2); E. Horner; W. B. von Haansbergen, Newcastle-on-Tyne. c, J. T. Lishman.

RABBITS.—*Long-eared*.—1, C. Gravel, Thorne. *Any other Distinct Breed*.—1, T. M. Corbridge, Bradford. 2, A. Preston, Allerton. 3, H. G. Pool, Bradford. *Common*.—1, J. Knight, Allerton. 2, H. Dixon, Allerton. 3, L. Leech, Allerton.

JUDGES.—*Poultry*: Mr. J. Dixon, Bradford, and Mr. R. Teebay, Fulwood. *Pigeons*: Mr. E. Hutton, Padsey.

MORLEY POULTRY SHOW.

THIS was held on the 5th and 6th inst. The *Game*, *Geese*, and *Rouen Ducks* were very good. The first-prize pen of *Golden-pencilled* was by far the best of those shown in the *Hanburgh* classes. Of *Pigeons* there was a good show.

SPANISH.—1 and Cup, C. W. Brierley, Middleton. 2, J. Thresh, Bradford. *DORINGS*.—1, J. White, Northallerton. *BRAMA POOTRAS*.—*Dark*.—1, E. Leech, Rochdale. 2, W. Whitley, Sheffield. *GAME*.—*Black-breasted Reds*.—1, R. Hemingway, Halifax. 2, W. Fell, Adwalton. *Brown-breasted or other Reds*.—1 and Cup, C. W. Brierley. 2, W. Fell. *Duckings or other Greys or Blues*.—1, J. Lamington, Spalding. 2, H. C. Mason, Drighlington. *Any other Variety*.—1, T. and C. Mason. 2, R. and H. Walker. *Cock*.—1, C. W. Brierley. 2, H. Beeland, Bradford. 3, W. Fell. *Hen*.—1, H. Beeland. 2, J. Fell. *hc*, C. W. Brierley. *HAMBURGERS*.—*Gold-spangled*.—1 and 2, J. J. Rollinson. *Silver-spangled*.—1, H. Picles, jun., Earsby. 2, R. Barren, Morley. *Gold-pencilled*.—1 and Cup, S. Smith, Northowram. 2, W. Hingworth, Idle. *Black*.—1 and 2, W. Hingworth. *BANTAMS*.—*Game*.—1, J. J. Rollinson. 2 and *hc*, F. Steel, Halifax. *Black*.—1, S. and R. Ashton, Mottram. 2, W. Hingworth. *Any other Variety*.—1, W. Whitley. 2, S. and R. Ashton. *SELLING CLASS*.—1, C. W. Brierley. 2, J. Fell. *GEESE*.—1, E. Leech. 2, J. White. *DUCKS*.—*Roan*.—1, E. Leech. 2, J. White. *Aylesbury*.—1, E. Leech. *Any other Variety*.—1, C. W. Brierley. 2, S. and R. Ashton.

PIGEONS.

CARRIERS.—1, H. Yardley. 2, E. Horner, Harewood. *OWLS*.—1, J. Thresh. *TURBITS*.—1, E. Horner. 2, H. Yardley. *BARDS*.—1, H. Yardley. 2, E. Horner. *TUMBLERS*.—1, H. Yardley. 2, C. Anton. *FANTAILS*.—1, H. Yardley. 2, E. Horner. *POUTERS*.—1 and 2, E. Horner. *JACOBS*.—1 and 2, E. Horner. *TRUMPETERS*.—1, J. Thresh. 2, C. Anton. *ANTWEERS*.—1, C. Anton. 2, E. Horner. *ANY OTHER VARIETY*.—1, E. Horner. 2, C. Anton.

JUDGE.—Mr. John Crosland, jun., Wakefield.

ROYAL AGRICULTURAL SOCIETY'S (OF IRELAND) POULTRY SHOW.

THIS was held at Ballinasloe on the 3rd, 4th, and 5th inst., and the following awards were made:—

DORINGS.—*Silver-Greys*.—1 and 2, Mrs. Warburton, Kill, Naas. *Chickens*.—1, W. Magrath. 2, Mrs. Warburton. *Chickens*.—1, R. P. Williams. *Coloured*.—1 and 2, Mrs. Warburton. *Chickens*.—1, J. C. Cooper. *Limerick*. 2, Mrs. Warburton. *SPANISH*.—1, S. Mowbray, Mountath. 2, R. P. Williams. c, J. C. Cooper. *Chickens*.—1, S. Mowbray. 2, R. P. Williams. c, J. C. Cooper.

BRAMA POOTRA.—1 and 2, Mrs. Warburton. *Chickens*.—1, J. C. Cooper. 2, Mrs. Warburton. *COCHINS*.—*Buff*.—1, J. C. Cooper. 2, Mrs. Taaffe. *Chickens*.—1, Mrs. Taaffe. 2, J. C. Cooper. *Other colours*.—1 and 2, Mrs. Taaffe (Black and Partridge). *hc*, R. P. Williams (Partridge). *Chickens*.—1, R. P. Williams (Partridge). *Chickens*.—1, S. Mowbray. 2, J. C. Cooper. *Bards*.—1 and 2, J. Hyland, Dublin. *GEESE*.—1, Mrs. Warburton. 2, R. P. Williams. 3, J. C. Cooper. *hc*, S. Mowbray. c, R. Bowman. *DUCKS*.—*Aylesbury*.—1 and 2, R. P. Williams. *Roan*.—1 and *hc*, R. P. Williams. 2, J. C. Cooper.

JUDGES.—Mr. C. F. Stanton, Cappagh, Clonda Ikin; Mr. W. G. Merry, Blesington, Co. Wicklow.

FULFORD POULTRY SHOW.

THIS Show was held on the 1st inst. The entries were not numerous, but the quality of the birds was good. The *Spanish*, *Dorkings*, *Hamburghs*, *Ducks*, *Geese*, and *Turkeys* were all that could be desired.

SPANISH.—1, W. Bearpark, Ainderby Steeple. 2, E. Thackray. *DORING* (Any variety).—1 and Extra for best pen, W. Bearpark. 2, Rev. G. Huster, Stillingfleet, York. *GAME* (Any variety).—1, C. Triffitt, Cattel. 2. — Mollett. *HAMBURGH*.—*Gold-spangled or pencilled*.—1, W. Bearpark (Spangled). 2. — Mollett (Pencilled). *hc*. — Crummack, Fulford. *Silver-spangled or Pencilled*.—1, W. Bearpark. 2. — Lazenby, Escrick. *hc*, W. Croft, Lendal. *BARNDOOR* (Any cross breed of fowls, Bantams excepted).—1, J. Hatfield, Oshaldwick. 2, Rev. G. Huster. *hc*. — Lazenby. *CHICKENS* (Any variety).—1, Rev. G. Huster. 2. — Tasker, Naburn. *BANTAMS* (Any variety).—1. — Lazenby. 2, G. Hutchinson. *hc*, T. Wheatley; A. S. Perfect, Fulford. c, J. Jackson, Heworth; Miss G. Cattle, Bishopthorpe. *ANY VARIETY*.—1, W. Bearpark. 2 and *hc*, C. Triffitt. c, S. A. Webster. *GEESE* (Any variety).—1, Rev. G. Huster. 2, J. Harrison. *TURKEY* (Any variety).—1, Rev. G. Huster. 2, A. S. Perfect. *DUCKS* (Any variety).—1, Rev. G. Huster. 2, A. S. Perfect.

CAGE BIRDS.

CANARY.—*Belgian*, *Yellow*.—1 and 2, J. Baines, Little Shambles. *Belgian*, *Buff*.—1, J. Baines. *Yellow half-bred*.—1. — Bradbury, Dringhouses. 2, J. Calvert, Bootham. *Buff half-bred*.—1. — Bradbury. 3, J. Calvert. *Yellow Common*.—1 and 2, C. Burton. *Common*.—1, C. Burton. 2. — Bradbury. *any Breed* (Marked).—1, J. Calvert. 2, C. Burton. *Crested*.—1, J. Calvert. 2. — Mollett. *Cinnamon* (Yellow or Buff).—1 and 2, J. Baines. *Lizard* (Gold or Silver-spangled).—1, J. Baines. 2, C. Burton. *Male* (Marked).—1, Mrs. Kirkew, Warthill. 2, C. Burton. *REDCAP*.—1, J. Calvert. 2, Mrs. Kirkew. *PARROT*.—1, J. Calvert. 2. — Hill. *CAVE OF BRITISH BIRDS* (Canaries excepted).—1, J. Calvert. *TURTLE AND RING DOVES*.—1, W. Kirby.

CANARY.—*Lopecared*.—1, W. Ellison, Skeldergate. *Any other Variety*.—1, J. W. Hunter. 2, C. Wooltons.

JUDGES.—*Poultry*: Mr. Coates, Escrick. *Cage Birds*: Mr. Cooper, York. *Rabbits*: Mr. M. Millington.

FOOD FOR PIGEONS.

ALL breeders of fancy Pigeons know that it is absolutely necessary during the breeding season to add a little wheat to the usual food given at each meal. I refer more particularly to the feeding of such stocks as are kept in confinement. Some old birds feed more greedily upon wheat than others, and consequently give their young ones a large portion of that grain. When this is the case it is the means, as a rule, of causing a purging or scouring in the young ones, keeping their nests wet and dirty, retarding the development of their plumage, and preventing them from thriving as they would otherwise do. The antidote I have used for this is a few tick beans put over the throats of the nestlings every evening till the purging is stopped. No Pigeons are more liable to purging from an over quantity of wheat than young Pouters, and there are none so liable to go wrong from being handled while in the nest. Without great care many lose the power of their limbs, and excessive purging also causes this.

A few weeks ago, while looking over a grain merchant's samples, I came upon a bag of rye, which I ordered as a substitute for wheat. My birds seem to like it as well as wheat, and having at the time young ones of all ages, from one day to flying point, this (to me) new summer food has proved so far a success, as I have not, since its introduction, had one case of purging among my birds. It has, so far, been the means of saving time and trouble to myself, and also of allowing the old birds to pass out of and into their nests with comfort. Rye is cheaper than wheat, a matter of importance now-a-days; but should it be proved that it does not cause purging, as wheat is so apt to do, it will be of great importance, as many valuable young Pouters may be saved.

Should any of our friends have tried this grain or feel inclined to try it, their remarks on its effects as a feeding article will be of consequence. It is little things, often the very little things, on which our success in these matters depends.—J. HULL.

THE ALMOND TUMBLER.

[THE following minute and excellent article is from the pen of Mr. Thos. Hallam, of the Birmingham Columbarian Society, which Society has also supplied the engraving.]

In accompanying our illustration of a standard Almond with a description of this, in the opinion of many, the most beautiful of our fancy Pigeons, which, as well as the Carrier and

the Pouter, is an indigenous variety that the fanciers of this country may well feel proud of, it may be as well, perhaps, to preface our remarks by stating that our aim on the present occasion is not to set up any new standard or to improve upon any of the properties which have long ago been established. We merely hope, by the help of the accompanying exquisite picture, and by setting forth the points of the variety in question briefly and lucidly before the readers of this Journal, by pointing out its beauties, and perhaps touching a little on that bugbear which no doubt deters many from entering the fancy—the difficulty of breeding—to be able to enlarge the circle, not of the admirers of the Almond, for every one, whether in the fancy or not, admires its pretty form, its jaunty step, and wonderful diversity of colour, but the circle of its cultivators; in short, to induce more gentlemen to enter into this engrossing fancy, and not to leave it, as at present, in the hands of but a few.

Further improvement we do not think it is possible to make upon the best strains; the utmost limit having been reached. But the majority of the birds we meet with, especially out of the neighbourhood of the metropolis, are sadly in want of some improvement, particularly in head, beak, and carriage; and we cannot but express the hope that our present contribution to "our Journal" may be instrumental in some slight degree in bringing about this desirable end. We should much like to see this lovely variety in greater force at our exhibitions; to see some of the gems which we know are in the possession of a few private fanciers who never dream of exhibiting; to see them with their beautiful plumage all fresh and glossy from their own lofts, instead of the jaded and in many cases worn-out birds which make their appearance merely for trade, and which are bundled from one exhibition to another till death happily puts an end to their miserable existence. We are, however, well aware of the uselessness of setting our anticipations too steadfastly on a pleasure which we fear will never be realised, at least while exhibitions continue open so long as at Bingley Hall, standard Almond Tumblers so valuable, and the prizes (we are not complaining), so inadequate to the risk incurred.

But to return to the more immediate object of this notice. In giving a description of the five acknowledged properties of the Almond Tumbler, we are well aware that we are touching upon a delicate subject. It is a well-known fact that even our first fanciers and judges cannot agree amongst themselves as to which property of the five is of the greatest importance. Some claim colour, others head and beak, and some are for shape and carriage. In offering our opinion upon this contested point we merely state what we as a society are guided by, without in the slightest degree hoping, after so long a period of indecision, that our opinion will come to be the generally acknowledged one. It has been argued that the great difficulty of attaining and maintaining the true standard feather of the Almond should not only cause that to occupy the first position, but to rank equal to three of the other properties. But we would respectfully urge that this difficulty exists only in connection with the high-class head-and-beak birds—that is, getting both head and colour together. It is well-known that among the coarse common birds some of the loveliest colours are not only easily got, but just as easily kept. In fact, there is not the slightest difficulty in breeding to standard for feather in that class. We may, perhaps, be allowed to ask the practical question, "Which of the properties imparts the greatest value to a bird intrinsically, setting aside all questions of individual taste?" and we have every confidence that the answer from the majority of fanciers who really know what Almonds are, would be, "head and beak." However beautiful birds may be in feather, and combining, as we have known instances, a good carriage as well, if they want the head and beak—that is, if they are moneys and coarse—a few shillings is the most which can be obtained for them. Generally, and we speak from experience, the difficulty is to get rid of them at all. On the contrary, however, for first-class head-and-beak birds, whatever may be their colour, whether Kite, Agate, Whole-feather, or Splash, a ready market is always at hand, with good prices, and sometimes such fabulous ones as would astonish many an uninitiated person. Fifteen pounds have been refused for Kites and Agates, and we have even known their weight in sovereigns offered and refused for a pair which it was well known would not breed. How much would have been offered for them with bad heads and beaks, but maintaining every other point they possessed? We leave the question to the decision of the fancy, merely repeating that the property or properties which intrinsically lend the greatest value to a

bird are, in our opinion, the most important. We are not particularly anxious about this matter, neither do we wish to thrust our opinion upon those who do not agree with us; but believing we are right, and that the majority of the fancy who are competent to judge are with us, we shall mention the properties of the standard Almond in the following order—viz., head, beak, eye, shape and carriage, feather, and leave our readers to the Englishman's privilege as to what they will make up their minds to breed for.

The head of the Almond Tumbler should be round, broad, and high. The forehead especially should be broad and prominent, the feathers rising perpendicularly from the nostril, and the more they give the appearance to the bird of the forehead overhanging the beak the greater will be its value. This is, of course, when looking at a bird in its natural position; but the actual skull of the bird denuded of its feathers, or when they are pressed down with the finger, should form the half of a circle—that is, drawing a line from the centre of the nose wattle to the back of the head. A head such as we have described possesses what is termed by the fancy a good "stop," and is the very opposite to the term "moussey," which means a low, narrow skull, tapering gradually and in a point to the bill. This latter is, in our opinion, the greatest defect a bird can have. The feathers running from the lower jaw round to and covering the ears should be full, prominent, and slightly curving upwards, as shown in the present. This feature adds very much to the appearance of the head, and its technical term is "muffy."

In speaking of the beak, we shall not attempt to describe the points of difference between what are termed the Goldfinch, Canary, or other beaks, or instance half an oat or barleycorn as a simile. Such guides are at the best merely ambiguous ones, and point out nothing definite to the young fancier. We shall simply say the beak should be as short, straight, and fine as possible; and the smaller the nose wattle is the better. It has been said that it should be so fine as merely to resemble a white thread drawn across the roots of the feathers; but we do not wish to cut the matter so fine as this, because, for various natural reasons, we do not think it is to be obtained. On the other hand, we would deprecate anything in the way of a large and coarse wattle. It has also been urged that the beak should be white; but this, again, cannot be depended upon, as it is always affected very much by the colour and age of the bird.

The eye should be a clear pearl, large, bright, and prominent, and should be in the centre of the head. If possible, no cere or lash should be perceptible, and the feathers should grow close up to the edge.

The shape and carriage of the Almond are generally taken as one property, and as such is one of the greatest recommendations a bird can have in the eyes of a true fancier, especially for purposes of breeding. Such property at once indicates a well-bred bird. The smaller a bird is the better, the beauty of the other properties being thereby greatly enhanced. It should be short in body, flight, and tail; the legs short, and the feet small. The neck should also be short, and thin immediately around the throat, curving gracefully and imperceptibly into the chest, which should be full, broad, and prominent. In position the bird should stand erect with the head thrown back, so as to be in a direct perpendicular line above the feet; the chest held well up, showing its great prominence between the butts of the wings. A low chest is a great disfigurement to the proper carriage, and is what is termed "goose-breasted." The tip of the tail should just touch the ground. The flight feathers should be carried drooping below the tail, showing their colours to greater advantage, and clearly developing the rump, which should be well covered with feathers, and nicely curved. A bird in the above position should stand entirely on its toes, the ball of the foot being slightly raised from the ground. Of course an Almond Tumbler is not always to be seen in this position, any more than the Carrier or Pouter are constantly in the positions in which they are invariably portrayed; but if a bird has any pretensions at all to a good shape and carriage, whether cock or hen, it will be seen in all its beauty during the time the cock is driving to nest.

In speaking of colour, we must confess we are troubled by the difficulty with which all writers on this subject have had to contend—that is, the want of a suitable term adequately to express what the proper ground colour of the bird should be. The term most in use, and which seems to us the best for the purpose, is to call it a bright "Almond Yellow"—that is, that it should as nearly as possible resemble the colour on

the inside of the shell of the almond nut. Having this as the ground colour, the whole of the body should be neatly and evenly pencilled, not splashed or spangled, with a clear black. This should be the case particularly on the neck and rump. Each feather in the flights and tail should be evenly and distinctly broken with the three colours—black, white, and the yellow or ground colour. The feathers should be tight and compact, and a bright glossy hue overspread the whole of the body, the beautiful effect of which, when the bird stands in a ray of sunlight, can readily be imagined. We have omitted to state that any tinge of blue about the tail, or, in fact, on any part of the bird, is very detrimental, at once showing that it is not well bred. The hen should be similar to the cock in every respect, due allowances, of course, being made for the sex; the hen in every variety being never so bold in appearance, and always more delicate in structure than the cock bird. The great and insurmountable difficulty, however, with the Almond Tumbler hen is to get the proper ground colour sufficiently broken. A hen up to the standard in all points would realise a small fortune.

Whilst upon the subject of feather, it will be perhaps as well to notice the great variety in colour that is produced by these birds, such as Kites, Duns, Red and Yellow Whole-feather,

Splashes, and Agates, the latter term being applied to all birds which have the red or yellow feather more or less intermingled with white, after the manner of what are known as Gay Mottles. Kites are black birds, with a brilliant metallic lustre pervading the feather; and the flight and tail feathers are tinged with red or yellow, which is termed "Fiery." These birds generally run better in head and beak than the Almonds, and are most useful for breeding purposes. In fact, it is totally impossible without them to maintain strength of feather. Splashes generally run very light in the ground colour, with the black very considerably and unevenly intermixed. These birds, especially the hens, are also most valuable for obtaining a good break of feather. Birds of nearly all the above varieties of colour now make their appearance with success in the "Shortfaced, any variety," class at most of our large exhibitions.

In conclusion, although we have already been far too lengthy in our notice, we should like to add a few words in reference to breeding. We firmly believe that a false impression exists respecting the great delicacy of these birds, and the difficulty, nay, almost impossibility, of raising progeny from them. We wish distinctly to state, more particularly for the encouragement of those who otherwise have an inclination to enter the fancy,

that all such fears are groundless. The birds are, or should be, as robust as any variety of fancy Pigeon we have; and in illustration of this we may perhaps be allowed to state that a member of the Birmingham Columbarian Society kept a few of these birds in an open aviary, certainly with a southerly frontage, for a space of eight or nine years winter and summer, without any other protection from the weather than the roof, and no birds could possibly be healthier than they were, having during the time never had the slightest ailment. We also know on reliable authority of a collection of fancy Pigeons of all kinds being sent to Canada, and all, we believe, with the exception of the Almonds, succumbing to the rigorous winter which followed. And these were birds of the highest quality as to standard properties. With regard to breeding, a little more attention is no doubt required for the Almond than for other varieties. This is particularly the case at the times of hatching, and shifting the young under the feeders; but this little extra attention, instead of being a trouble, is rather a pleasure to the ardent fancier. For the information of would-be fanciers, we will give a simple plan in regard to breeding which has been found not only effective, but remarkably successful. The first and most important matter in Almond breeding is properly matching the birds; and on the fancier's knowledge of this

much of his success will depend. No precise rule can be laid down; nevertheless a few practical suggestions may be given. A Kite may be matched to almost anything but a Kite, such as an Almond, light Splash (that is, a bird with not too much black), Red or Yellow Agate or Whole-feather; but of all, the best, in our opinion, is the match of a Splash and a Red or Yellow Agate—the Red preferred. It is well not to match the birds too rich in feather, especially if close bred, or white and purblind birds will be the result. Experience and a knowledge of how the birds are bred are everything in this matter; and even then no certainty as to the colour of the offspring can be depended upon. It is a fact that birds which one year have thrown the most beautiful Almonds, have the next season produced nothing but Kites. A great advantage in this variety is the extent to which they can be bred in, not only improving them in character, but avoiding that nuisance to all breeders of other birds, especially the Carrier and the Ponter, of the necessity of finding and purchasing suitable crosses. Almonds as a rule are very prolific; and to insure a fair amount of success all that is required is a little attention at the right moment.

A staff of nurses is an indispensable requisite to the Almond breeder. For this purpose the common Baldheads are the best, and of these what are called the "pleasant-faced" ones—that

is, not too long in the bill, are to be preferred. It is well to keep as many of these as the fancier conveniently can, for when not rearing Almonds their young ones will find a ready sale at prices which will render their keeping profitable. And now for the simple plan to which we have alluded. When the first egg is laid remove it to some safe place (a little box of bran, or elsewhere) substituting an added one. Replace the good egg about 9 A.M. on the third day. This prevents the birds commencing to sit on the first egg, which is very often the case, and ensures both birds being hatched together. Keep a diary of the date on which the eggs should hatch; and on that day be ready, should occasion require it, to help any young bird to extricate itself from the shell, as it often happens, either from weakness or excessive shortness in bill, they are unable to extricate themselves. Do not be in too great a hurry to break the shell; and above all, abstain from doing so till all the blood in the shell is absorbed. It is often the case that a young bird is so fine in the bill or so weak that the old birds are unable to give it food, and it dies in consequence. If either of the young birds are not fed towards the evening of the day on which they are hatched, get a few groats and masticate them into a pulp. The young bird will readily take this from the mouth. In this manner it can be kept alive till something can feed it. Dozens of the best birds have been saved in this way. The great difficulty with regard to Almonds is the early period at which they leave their young (generally on the fifth or sixth day), and the fancier must be ready the moment they are left to remove them under a pair of feeders which have just hatched. They may be then said, unless any unforeseen accident happens, such as all varieties are liable to, to be out of hand, and require very little more attention. If the old birds have sat on them till the sixth day, let them go to nest again. If they leave them earlier, and have not fed off their soft food sufficiently, supply them with a common young one for a day or so.

Having now considerably exceeded the limit of the space at our disposal, we shall conclude our remarks by hoping they may be found useful to some, and may be the means of still further extending the delightful fancy of which we have been speaking.

HOW LONG ARE QUEENS AND WORKERS IN THEIR CELLS?

AND WHEN DO QUEENS COMMENCE EGG-LAYING?

I AM glad Mr. Woodbury has been induced to set about observing and experimenting, with the view of correcting some of the mistakes which I have made in the natural history of bees. Without admitting that I am wrong on the points noticed in his letter (page 55), I am, as he says, "most anxious to rectify mistakes as soon as sufficient evidence has been adduced to satisfy me that I am really in error." Every honest and truth-loving man is not only anxious to avoid making mistakes, but is ever anxious to acknowledge and rectify those he has made. I hold that there is more honour in confessing a fault or admitting a mistake than there is in conquering a kingdom.

I have read Mr. Woodbury's letter touching my so-called mistakes twice over without finding "sufficient evidence to satisfy me," and until sufficient evidence be adduced I shall be permitted to adhere to my old opinions; and after all, the difference is only a question of forty-eight hours. Very recently Mr. Woodbury admitted that, dating from the removal of an old queen, fourteen days are the average time which elapses before a young one is hatched out, although some are longer. His last experiment, recorded in page 55 of the Journal, indicated that sixteen days elapse before a queen is developed from an egg. This experiment was fairly made and honestly recorded, and I consider that Mr. Woodbury is incapable of acting unfairly in word or deed, and I know something of his diligence in honestly investigating questions of bee-history. No one would rejoice more than myself to see the bee-loving community of this country acknowledge in some tangible and substantial form the services of Mr. Woodbury, better known as "THE DEVONSHIRE BEE-KEEPER."

His queen that was born on the 23rd of June was unquestionably sixteen days in being hatched. I have known queens fifteen and sixteen days in their cells, but I have found that fourteen days are the usual time. Large hens' eggs are sometimes twenty-two, twenty-three, or twenty-four days under the hen, but the usual time is twenty-one days; and so with other animals the period varies. Probably the next experiment made will not tally exactly with that recorded by Mr. Woodbury.

Now as to the production of workers, "THE DEVONSHIRE BEE-KEEPER" says he has "obtained abundant evidence by placing numerous empty combs in 'brood nests' of various hives, and has invariably found that workers commenced hatching not later than the nineteenth day, and in some cases on the eighteenth." The word "commenced" leads me to ask our friend if all the brood of workers was hatched on the nineteenth day in one, and on the eighteenth day in another? for to say it commenced to hatch leaves us to guess when the hatching was completed. I have the evidence of three score of hives artificially swarmed every year to prove that many young bees are unhatched till the twenty-first day after their queens have been removed from them. I swarm about sixty hives yearly, and many of them have all the honey taken from them as soon as the brood is hatched, and I have never found an instance of all the brood being hatched on the twentieth day after the queen was gone, and sometimes I have known workers twenty-two days in being hatched. Besides, the experiment of removing queens from hives altogether is, I think, a far more satisfactory one than that of placing a bit of empty comb in a brood nest. When a queen is removed from a hive altogether I find that her eggs last laid in the hive do not become perfect bees till the twenty-first day after; and if all the bees be removed from the hive on the twentieth day, the unhatched working bees, generally a great number, will struggle out of their cells on the day following. My mode of managing bees for profit leads me to witness this fact almost daily for weeks and months every year. Hence I repeat that twenty-one days are the usual time for workers to be in their cells, "THE DEVONSHIRE BEE-KEEPER'S" late experiment notwithstanding.

The other point of Mr. Woodbury's letter calling for a remark is that touching the fertilisation of queens and egg-laying afterwards. I have said that egg-laying generally commences from six to ten days after impregnation. He mentions an instance of a queen commencing to lay in forty-six hours. I do not question it for one moment, but I may be allowed to state that the fertilisation which he observed was perhaps not the first, and it is not at all unlikely that his queen would have commenced laying drone eggs at the same time if she had never met the drone.

It is exceedingly painful to me to have to offer any remarks apparently in opposition to Mr. Woodbury, and I should be glad to see with him eye-to-eye, but there is a great want of completeness in the evidences he has adduced. I have known many young queens commence to lay ten days sooner than others, and with close observation there will be seen in every apiary a difference of some days as to the time of the successful flight and egg-laying. Every honest writer of experience fairly and faithfully records the evidences and facts that come to him through his own eyes. "The Handy Book of Bees" is welcomed into the homes of rich and poor as an honest production, and the great satisfaction it gives to all classes of readers will be a stimulus to the author to make a second edition, if ever called, for, more complete and satisfactory than the first. Only two or three points in the book have been demurred to by critical reviewers, and our Devonshire friend is satisfied that some other points are wrong, but which cannot readily be put to the test of actual experiment. The author will feel indebted to him if he will kindly catalogue these supposed errors, so that others may examine and test, if possible, the points disputed.—A. PETTIGREW.

[I do not know that I need say much in reply to the above communication, in which, without adducing a tittle of evidence in support of his views, Mr. Pettigrew contents himself with reasserting his errors and cavilling at the facts by which they have been refuted. It seems to me, however, that when a man professes to understand these points in the natural history of the honey bee better than either Huber or Dzierzon, Dr. Evvan or Mr. Laugstroth, something more than this may fairly be required of him. If Mr. Pettigrew has really found that the usual time which elapses between the laying of an egg and its development into a queen is only fourteen days, he can surely have no difficulty in citing at any rate a single instance, stating as I have done the circumstances under which it occurred, and the precautions taken to guard against mistakes. So also with regard to his assertion that egg-laying is delayed until six to ten days after fertilisation; it is scarcely too much to ask him for particulars of one such case, together with the circumstances which attended so remarkable a phenomenon. As in order to weaken my evidence it is suggested that the results which I have recorded may be regarded as exceptional, I would state that I have been breeding queens for the last ten years, during which period scores of instances have come under my direct

observation (sometimes as many as three or four in the same day), and I have never yet known a case in which oviposition did not commence on the second day. Neither, in all my experience, have I ever met with anything that would countenance the belief that a queen can be raised in so short a time as fourteen days from the laying of the egg. Parthenogenesis is a subject which I must decline to enter upon here, but I may remark that Mr. Pettigrew is utterly mistaken in what he fancies to be the effect of my reasoning on this point. I have, however, a high opinion of his abilities as a practical apiarian, and it is for this reason, and because he has expressed himself as being most anxious to correct mistakes, that I have expended no little time and trouble in what turns out to be the vain attempt to set him right. I find it indeed so difficult to satisfy him that he is in error on points which admit of being brought to the conclusive test of actual experiment, that I must excuse myself from particularising others which cannot so readily be submitted to the same decisive proof.—A DEVONSHIRE BEE-KEEPER.]

OUR LETTER BOX.

BRAHMA CHICKENS LEG-WEAR (T. A. D.).—As at thirteen weeks old, and without a drop of rain to cool the surface of the earth, your Brahma chickens have reached 5 lbs. weight, the growth has been so rapid that we do not wonder the legs decline to carry the load of flesh. They are little more than cartilages. What is the leg weakness. Patience and good feeding will remedy that, and as the bird gets older the progress in the right direction will be visible. As his legs gain strength he will carry his body with comfort. We are almost tempted to imagine you have over-fed to attain the weight you mention, and if so, you have induced idle and fat-making habits, which are opposed to the formation of bone and muscle. You would have helped us to have come to a right conclusion if you had given us an idea of the feeding and lodging. The contraction of the toes is not from leg-weakness, but from cramp, and that is either from bad feeding or damp. We do not here speak of atmospheric dampness, but of damp flooring—wood, stone, brick, or asphaltum. Either of these will produce cramp, and when the toes are drawn up and paralysed the appearances are against recovery. If you have any of the floorings above described, take them up, or cover them inches deep in gravel or road grit. Feed the birds on ground oats or meal; give them bread and ale, and also, once a-day, a couple of camphor pills the size of garden peas. These may be discontinued as strength returns. We presume it is only among cocks weakness prevails. If they persist in roosting on the ground, it is well to put a little straw for them in one corner of the house, otherwise they suffer from a round troublesome sore on the hocks.

HOUDAN CHICKENS (Subscriber).—We call your chickens good for their age. In the breeds where weight is one of the principal, if not the principal merit, 1 lb. per month up to four months is called satisfactory progress, and such are viewed hopefully as future prizetakers. See that both are live-clawed, that their legs are spangled, and that the cock has no red feathers. When they grow older and are furnishing, you can always add weight by judicious feeding during the fortnight preceding the show.

DUCKLINGS CRAMPED (E. R. P.).—Where do your Ducks roost? If it is in a house with a stone, brick, or pitched floor, there is the cause. It is cramp. Let them choose their own roosting-place, and recollect in a state of nature they often roost on the water. They do not suffer from any damp that arises from water, but they do from boards, stones, or bricks. You say nothing of food. If they have oats mixed with gravel and a sod of grass in their troughs, with the run of a meadow and a pond, they should do well. Cramp is often induced by insufficient or improper feeding.

SPANISH FOWLS LOSING FEATHERS (E.).—Part of the loss of feather may be attributed to the natural action of the season. The birds are molting; but if they are in confinement and denuded of all save the tail and wing feathers, they are picking each other's plumage and eating it. We know no cure. We believe there is only one, that is to give them their liberty. If at liberty you are convinced by seeing one pick and eat the feather of another, remove the offender; it is a habit, once taken to, that is never given up.

FEEDING RABBITS (A Young Subscriber).—A great point in making good Rabbits is to allow a doe to rear but four young ones. If well fed she will almost fatten them on her milk; but they will not be large. If it is desired to rear as many as possible, and to make them large, they should be fed on oats and bran moderately, with green food, but liberally, and with the greatest variety of roots. They may have milk to drink, and if not milk, they should always have water.

RABBIT MANAGEMENT (A Novice).—Rabbits will not generally indulge in the disagreeable habit named if well supplied with, say, a little milk and bread once a-day, or common peas soaked in water for twelve hours, pouring off the water the peas are soaked in, and giving fresh along with them; or give fresh water alone three or four times a-week, especially during this hot weather, when the juices of all green food are almost dried up from want of rain. It will not be difficult to wean them of the habit complained of by offering them greater and more wholesome attractions in the feeding trough.

REMOVING BEES (D. B.).—We should advise you to dispose of your present stocks rather than incur the risk first of uniting, and then of transporting them from Jersey to the north of England. The canvas hive covers afford shade and excludes rain, but is not a good winter protection.

POINTS OF NUNS (T. A. D.).—Nuns should have from seven to ten light feathers dark, the same colour as the head, also the twelve tail feathers, and a few of the tail-coverts. The body should be perfectly white, as well as the hood, which should be large and well-developed. The eyes should be of a clear pearl colour.

STILL FOR DISTILLING LAVENDER (E. R. P.).—By applying to your

ironmonger he could procure you a small still, suitable for distilling lavender and rose water. Such a thing made of tin is very inexpensive, and answers the purpose equally as well as one much more costly. The following may guide you in making rose water:—Gather the flowers in fine weather two hours after sunrise; take out the calyx, and separate the petals; pound them in a marble mortar to a paste, and leave them five or six hours in the mortar; then put them in a large close cloth, and let two persons wring it with all their strength. Having by this operation obtained 4 lbs. of juice, infuse it in an equal weight of fresh rose petals for twenty-four hours. At the end of that time put the whole into the alembic, which place in a sand bath, and distil it. When you have collected about 1 oz. of the water unite the receiver, and if that which issues from the still is as odoriferous as that which preceded first, continue the operation; but if not, collect it into another vessel, as this second water is not single, and must be kept separate from the first, which is the essential water. Should the second water have an unpleasant smell (caused by the application of too much heat), expose it to the sun for a few days, covered only by a sheet of paper. The utmost care is necessary in distilling this and all other odoriferous substances. A still more powerful essence than the above may be procured by the following method:—Gather as many roses as will afford 30 lbs. of petals, and pound these with 4 lbs. of salt; when pounded place the paste in a vessel in layers, with salt between each; press them closely, cork them tightly, leave the vessel twelve days, and then distil as usual.

From observations taken near London during the last forty-three years, the average day temperature of the week is 72.4°, and its night temperature 49.8°. The greatest heat was 92°, on the 18th, 1842; and the lowest cold 36°, on the 18th, 1866. The greatest fall of rain was 0.95 inch.

KENTISH ORCHARDS.

WHATEVER advantages there may be in cultivating our ordinary fruits under glass, and no doubt there are advantages, still it is evident the great bulk of the population must be satisfied with what is grown in the open air in orchards. The word orchard has always appeared to me to have something of poetry and wealth united; the beautiful appearance the orchard presents in April and May is followed, or is

expected to be followed, by a sight not less lovely in August and September, and at either season an orchard forms a very important feature in the landscape. Whether the trees are in blossom or laden with fruit, a full-grown healthy orchard is an object which the most careless never fails to take notice of, added to which the districts where orchards abound are generally well cultivated, and have a clothed appearance even in winter. The utility of orchards in a commercial point of view is also not one of the least of their attractions, and seemingly fabulous prices have often been paid for crops of fruit when sold on the trees. Into this subject, however, I will not enter, but shall content myself with making observations on the system of management which some cultivators adopt with great success.

Considering the great diversity of soil in which the cultivation of Apple, Pear, Plum, Cherry, and bush fruit trees is attempted in this county (Kent), it can hardly be expected that a uniform system of treatment can be recommended, but in general it used to be urged that a Cherry orchard ought to be on grass, and that the ground in which the other fruits were grown might all be in tillage. This idea, with certain modifications, formed the prevailing creed of the last generation of fruit-growers, and is far from being abandoned yet; but of late years many innovations have been made, and the advisability, or the contrary, of tillage has been discussed, some of its advocates pointing to the hedges, the best of which have adjoining the collar, in many cases, about a foot of tilled space free from weeds, and often dug 6 or 8 inches deep; while, on the other hand, the advocates of a turf bottom point to the oldest examples of fruit trees known, and in these think they have a strong plea in their favour, such trees being met in a green hearty old age in a meadow or paddock. The inquiry has led to many experiments, and I have on more than one occasion seen a mode adopted to meet the views of both parties without to any important extent losing the advantages of either system.

Happening lately, in company with a friend, to be travelling a few miles from here, we observed a very promising orchard of full-grown trees, with the usual undergrowth of bush fruits, which appeared to be in the best of health, and bearing abundantly, yet we were told by the proprietor that the ground had never received a particle of dung or other manure for a great many years. This orchard was planted in the usual way in this county, consisting of standard Apple and Plum trees, with 6-feet stems, at 18 or 20 feet apart, underneath them Filberts or

Cob Nuts, with Currants to fill up the intervals, the Cob Nuts being usually 12 feet and the Currant bushes 6 feet apart. The whole presented a mass of bush and foliage which some not acquainted with Kentish orchard-management would say wanted the saw and knife freely, or perhaps the mattock, but these are seldom used to the extent a stranger would think necessary; and whether necessary or not, I will not here stop to inquire. Let the result tell for itself. This mixed orchard, I may remark, was originally in tillage, but Mr. Manwaring, its owner, determined to try if it would not be as well to avoid mutilating the roots by digging, and for many years he has abandoned the use of the spade among his trees, and merely has the weeds hoed up when they are troublesome. In alternate autumns he spreads over the ground some hop-bine cut a little, so as to prevent its entangling anyone passing through it. This covering partly shades the ground, and, decaying gradually, supplies the trees with some additional food to compensate for the drain on the soil caused by what is taken away. It would doubtless be better if this dressing could be given every year, but it cannot always be spared, owing to the other uses the hop-bine is put to, but substitutes are sometimes had recourse to. Any kind of herbage or decaying substance would probably serve the same purpose, and I am not certain whether the result would be much different if nothing of the kind were used, as I imagine the principal benefit arises from the upper roots of the fruit trees not being disturbed by digging; at the same time the surface soil is not exhausted by supporting a crop of grass or hay, as where the orchard is in turf.

The above case is not an isolated one; I may mention one nearer home, where the best possible results appear to follow the adoption of a similar plan. Adjoining the grounds of Preston Hall, near Maidstone, is a fine orchard of some twenty years' growth. This orchard in some degree resembles that last described, being composed of Apple, Plum, and Pear trees as standards, with Filberts, Cob Nuts, and Currants for undergrowth, and as it was planted expressly for the private use of the family, the variety of fruits was greater than is often the case where the produce is intended for market, and I have on several occasions seen most excellent crops of fruit there; yet Mr. Bradley, the intelligent gardener, never puts a spade in the ground, only the weeds are hoed up when necessary, and the orchard forms a receptacle for all the rubbish of the garden, weeds and decaying matter of all kinds being wheeled on and spread about. I remember one year visiting the garden in spring, after a severe winter had made havoc with Laurels and other shrubs, and I found that Mr. Bradley had covered the orchard in a great measure with the foliage, shoots, and slender branches of the evergreens that had been killed or injured in the winter, reserving the stouter woody matter for faggots and other purposes. Decayed stalks of vegetables and other matters were also lying about for the same purpose. I have no doubt that the decomposition of these materials would benefit the soil at the spot where decay was going on; certainly nothing could be more healthy than the trees,

even the Ribston Pippin Apples looked tolerably well, which they rarely do in many places. Mr. Bradley had been trying some experiments with this fruit; he had worked some robust-growing varieties with the Ribston Pippin, and thought the result was more satisfactory than when the latter was not double-worked. I forget which variety was employed, but I think it was the Yorksbire Greening. More than one tree was operated upon with success.

Now, in the two cases referred to, there was a great difference of soil. In the first there was a somewhat adhesive loam, not by any means a stiff clay, but destitute of stones and sharp sand, the subsoil a sort of grey marl, and the surface so fine in texture that water did not easily percolate; in the other case the soil was more open, with a gravelly bottom, dry and porous, but not hungry in the sense in which that term is usually applied, for Plums, in particular, seemed to do remarkably well. The managers of both these fruitful orchards are strenuous opponents of cultivating orchard ground, especially after the trees and bushes have attained some size, and their roots occupy the ground; and certainly the appearance of their orchards indicated the correctness of this view. Their example, indeed, is partially adopted in many cases when the standard trees attain sufficient size to be thought worthy of occupying the whole of the ground; the undergrowth being then removed, grass is sown, but this is a questionable benefit; at least it is doubtful if it is so good as preserving for the use of the fruit crop the whole energies of the ground, whilst providing that shade and covering so necessary to keep in the moisture during such dry periods as we are now passing through.

I might say more on the matter, but I will merely remark that in such a place as an orchard there is ample space for the gradual decay of any woody or vegetable substance that may be put upon it, and the benefit of such substances to the soil they lie upon is evidently not yet sufficiently appreciated, but may be roughly judged by the fact of a stone of some size lying on the ground protecting the roots of all below it, but remove the stone and the result is hurtful. This well-known fact has led in many instances to landlords objecting to their tenants removing stones.

I advise all those who have not tried the plan here described to do so on a small scale, until they feel assured of its success, and in the end I have no doubt they will regard the practice of mutilating the roots of Apple, Pear, and other fruit trees as injurious; at the same time, as some assistance from manure is wanted, and the finer description of dung and easily-worked-in manure may be required elsewhere, the orchard forms a suitable place to deposit all such cartloads of rubbish as are rejected from other quarters. Time works wonders with such unpromising materials.—J. ROUSON.

CULTURE OF THE HERBACEOUS CALCEOLARIA.

With amateur gardeners this beautiful plant is becoming more popular, and with the cottager it is now an especial favourite; most gentlemen's gardeners are in possession of a good system of growing this plant, therefore I only offer my remarks to the first named.

Perhaps the most difficult part for the amateur to overcome is raising the seedlings; in this I think even professional gardeners often err by treating them too kindly. The following is a good plan. Prepare a shallow pan by filling it with light soil; press this down so as to present a very level surface a little below the rim; add sufficient silver sand on the surface to fill up the interstices; water well with a fine-rosed watering-pot, giving enough water to thoroughly moisten the soil, let it drain off, and then sow the seed. After this add a sprinkling of very finely-sifted sandy soil, be careful only to just cover the seeds, and finish by giving a mere sprinkling of water. Place the pan in a hand-light on a bottom of coal ashes; a suitable spot is a cool part of the garden, where no sun but plenty of light can reach the pans. The surface soil must not be allowed to become dry, and water very carefully to avoid washing the seeds out of the soil. The ashes may also be kept moist. A good time to sow the seed is the middle of August.

When the seedlings are large enough to be handled, prick them out an inch apart in pots or pans. If hand-lights can be provided continue the same treatment; but if not, a cold frame will do, placing the plants on a cool bottom, and keeping them near the glass. For a time, at least, they must be shaded from bright sun, but at all times and stages of their growth

they must be well ventilated. Careful and constant watching for snails will be necessary, for if these get in they will take off scores in one night. In about three weeks the plants will be large enough for potting-off; small 60's or small thumb pots may be used, and if the plants have not hitherto occupied a cold frame, let them have the protection of one at this stage and onwards through the winter, if protection from frost and good ventilation can be afforded. The shifting of the plants into larger pots may go on when the plants require it and the weather is favourable; a good general guide, however, is to shift when the roots are well at the sides of the pots, though the plants must not, under any circumstances, be allowed to become pot-bound when in a young state, for it causes premature flowering, and often throws the plants into a sickly state, from which they will not soon recover.

Good specimens may be grown in 6-inch pots, a size, perhaps, large enough for the amateur, but if plenty of space is at command, 8-inch or even larger pots may be used with advantage. Arrange the potting so that the last shift shall not be later than the last week in February.

The compost I recommend to be used consists of strong turfy loam one half, decayed leaf mould and road grit in equal parts to make up the other half; add sand liberally, and about one-fourth of the whole bulk of decomposed cow manure sifted. This soil will do for all the pottings, from first to last, only as the plants increase in size use it in a rougher state.

The plants may be advantageously pinched back about twice in the early part of their growth; this dwarfs them, and considerably increases the number of flower stems. At short intervals give some gentle smokings with tobacco, to keep the green fly in check; remember that if it once establish itself on the plants, the foliage being thick and close to the soil, it is not easy for the smoke to penetrate, and it will be almost impossible to free the plants of the enemy. Water must be given sparingly in the depth of winter, but towards spring, and after the plants have established themselves on their last shift, plentiful supplies may be given, with liquid manure from cow dung added. The great improvements that have been effected in this plant of late years render it no longer a difficult matter to secure a good strain of seed, with a large per-centage of good and distinct-coloured flowers; but the most varied assortment and the most pleasing strain I have grown was from a packet of seed, called Thomson's strain, purchased of Messrs. Veitch.—THOMAS RECORD, *Lillesden*.

GLOXINIA CULTURE.

POSSESSED of rare elegance of form both in its foliage and flowers, easy to cultivate and to maintain in full beauty and freshness for a considerable time, the Gloxinia takes high rank amongst summer-flowering pot plants. Strictly speaking, it is a tuberous-rooted stove plant, and this is doubtless the reason why Gloxinias are not more frequently to be seen in the amateur's collection of plants contained in his solitary greenhouse or conservatory. Many persons who admire them very much never think of attempting to grow some, because they have no stove or other glass structure in which a high temperature is maintained. Now this is a mistake; and it is my object in writing this paper, while treating of Gloxinia culture generally, also to endeavour to show how the plants may be grown and kept from year to year by persons having only one glass house, without the aid of a very high temperature.

A cheap and easy method of obtaining a collection of Gloxinias is to purchase a packet of seed, which should be sown early in March on the surface of a pan well drained and filled with fine soil. The seed should not be covered, but the pan should be placed in the brisk moist temperature of a hotbed, and the soil kept damp. When the young seedlings have formed two leaves they are potted singly in 3-inch pots and kept in the same position, taking care to paint the glass with whitewash, as all Gloxinias, and especially young plants, thrive best when kept moderately shaded. The seedling plants form firm tubers in the 3-inch pots, in which they are kept throughout the first summer and winter; as growth ceases they may be removed to a cool house, and they are stored in winter on any spare shelf where the temperature is kept at about 10° above the freezing-point. The tubers are not disturbed till spring. The only important point in their winter management is to see that the soil never becomes very dry, for if it is not kept somewhat moist every tuber will perish of dry rot.

When spring comes round again, or rather at any time in the first four months of the year, the plants may be shaken

out of the old soil, repotted in the same pots, and placed in a temperature similar to that in which they were raised from seed. As they make growth they should receive one or two shifts into larger pots, and be brought into flower in a house kept at a temperature of 65° or 70°. All these kinds, the flowers of which show that the plants are worth keeping, may now be considered to be established plants. As the flowers decay the plants should still be constantly watered, so as to make the decay of the foliage a very gradual process. By the time they are stored away in their winter quarters young growth will be just visible on the crown of each, and this is precisely the state in which I like to have them throughout the winter, during which they occupy a shelf at the back of a cool house from which frost is excluded. Care is taken not to saturate the soil in winter, but it is always kept in such a moist state that the few small leaves remain fresh and green; and as each successive batch is potted in fresh soil in spring, strong vigorous growth quickly follows.

Gloxinias are also increased by cuttings of the shoots and leaves. Shoots taken off the plants early in spring will form plants and produce a few flowers the same season. The best way to propagate by leaves is to insert each leaf upright and firmly in rich sandy soil in a 3-inch pot; placed in a vinery under the shade of the Vines and kept well watered, they produce fine tubers, which make good succession plants for the following season.

It has frequently been stated that the influence of a high temperature is necessary to enable Gloxinias to start into growth strongly and well, and so their culture would appear of necessity to be confined to those persons having such means at their disposal. A fair trial of the cooler method of culture, which I will now explain, will show this advice to be somewhat fallacious. If the owner of one of those pretty little conservatories now so frequently to be seen attached to villa residences be desirous of growing a few plants of this charming family, some strong young plants just coming into flower should be obtained, and kept while in bloom under the shade of some of the creepers which will probably be trained to the conservatory roof. As they go out of bloom they should be treated in precisely the way I have described, storing them closely on any back shelf where they can have light and are safe from drip and frost. So they should pass through winter, and as spring advances, and the young growth exhibits signs of animation, they are taken down, shaken carefully out of the old soil, and repotted in the same pots in soil composed of two parts loam and one part each of old decayed dung, sand, and broken charcoal. A position on the stage near the front of the house, where they can enjoy the morning sun, but are shaded at mid-day, will suit them admirably. Avoid exposing them to draughts, and syringe the foliage with clear soft water twice a-day, taking care to water the roots thoroughly when necessary. So treated they will grow steadily; and when the roots touch the sides of the pots, if large plants are required, they should receive a liberal shift, but otherwise a little guano water given occasionally will much assist the development of the foliage and flowers, which will be in full beauty early in August, and will continue so to nearly the end of September.

Gloxinias may be grown after this simple fashion to the greatest perfection, the plants being quite equal in vigour and beauty to those grown in a stove. Moreover, by this method a splendid lot of succession plants may be had, which will serve to prolong the flowering season, and thus prove in the highest degree serviceable to the gardener.—EDWARD LUCKHURST, *Egerton House Gardens, Kent.*

POMOLOGICAL GLEANINGS.

THE following NEW STRAWBERRIES are this year introduced by M. Gloede, of Beauvais:—

Baron Brisse (Gloede).—Large and rich, of quite a novel yellowish colour, rather late, and very productive.

Belle de Nantes (Boisselot).—Extremely large, and handsome shape, flavour first-rate; a noble dessert fruit. Plant exceedingly robust, and coming in very late.

Constantin Tretiakoff (Gloede).—Large and very handsome; colour deep brilliant scarlet, flesh solid and rich. A strong grower, very prolific, and remains long in bearing.

Favourite (Madame Clements).—Large, even conical shape, bright orange, of exquisite flavour. An improvement on Carolina superba, and a good forcer.

Helena Gloede (Gloede).—Very large and of delicious flavour. A noble fruit, ripening very late; will be valuable as a highly

improved Frogmore Late Pine, which it resembles as regards size and flavour, but to which it is far superior in growth, hardiness, and lateness.

President Delacour (Horticultural Society's Trial Gardens at Beauvais).—Large, globular shape, bright glossy red. A very showy Strawberry, solid, rich, and bntery. Plant very hardy and extremely prolific. Ripens at the medium season.

Roseberry maxima.—This is a very fine, large, and useful Strawberry, extensively grown in Russia, especially for early forcing. Exceedingly hardy and prolific; belongs to the Pine class. Real origin unknown.

Alpine Trouillet.—A much-improved variety of the Red Alpine Strawberry; fruit of large size for its race, and an immense bearer till frost sets in.

SELECT GARDEN ROSES.

NOT a few of the numerous Rose amateurs who regularly read "our Journal," and whose first eager glance over the headings of the various articles is to single out for immediate perusal any that relate to their especial favourite, must have experienced astonishment while scanning over a list of Roses, set forth as a select one, which appeared in page 98 of last week's issue. In the section of Hybrid Perpetuals (Remontants), there are sixty-one varieties named. Of these, Prince de Portia, Jules Margottin, John Hopper, Beauty of Waltham, Paul Verdier, Marguerite de St. Amand, Charles Lefebvre, Alfred Colomb, La Ville de St. Denis, Caroline de Sansal, Pierre Notting, Marie Raby, Antoine Ducher, and Prince Camille de Rohan are really first-class Roses, and should be in every collection, large or small, but their number all told amounts to only fourteen, or less than one-fourth of the whole selection; and one, Paul Verdier, is a very doubtful remontant, while Miss Ingram, also in the list, is certainly not remontant.

Of some merit, but by no means to be considered so good as the preceding, are Madame Clémence Joigneaux, occasionally fine, but too often coarse and dull in colour, not full, nor sufficiently remontant; Jean Goujon, large, but rough; Monsieur de Montigny, good, but of weak constitution, an insuperable bar to recommendation; Madame Charles Wood and Madame Moreau, remarkable for size, which renders them popular among exhibitors, but deficient in several respects. Léopold Hausburg has ceased to find favour from the inconstancy of its bloom; it occasionally produces a good flower; it is also surpassed by others of similar colour. Madame Alfred de Rougemont is praised by some rosarians on account of its pure colour; it is now superseded by Boule de Niede, which "inquirers" should substitute when they make their purchases. Madame Vidot is acknowledged to be a beautiful Rose, but few, if any, can grow it satisfactorily. Madame Knorr may still receive partial favour for its unique colour and free-blooming qualities. Madame Rivers, too, would be one of the most beautiful, and therefore one of the most valuable, of light Roses if it were but strong enough, but with regret we must place it among the things that were. Thus ten more in the list may receive a qualified recommendation, and this in some cases rather faint.

The remaining three dozen, or thereabouts, I would utterly discard from the rosery, if there already, and, of course, rigorously exclude their entrance for reasons which shall be stated. Taking them *seriatim*, or in groups, it seems almost a waste of time and space to discuss them; but people might be misled unless the fallacy of such a list offered for their assistance be fully exposed:—Mlle. Alice Leroy and Duchess of Sutherland are Roses of the past, which nobody would speak or even dream of now that we have the superb Baronne de Rothschild, a truly magnificent addition to our light kinds. Comtesse de Turenne, who has proved this? at what great show has it carried off honours? Duchess of Norfolk was once thought a good Rose, but who would care for it now in comparison with Madame Victor Verdier, Horace Vernet, Marie Baumann, Léopold Premier, Maurice Bernardin, Camille Bernardin, Maüchal Vaillant, and Sénateur Vaisse, every one of which should be chosen a long way in preference to the trash we are now reluctantly compelled to discuss? They are also among the best known and most familiar of all Roses. Of Baronne Prévost, still in almost every garden, an eminent rosarian, who contrioutes much valuable information to these pages, on one occasion wrote to me, "Poor Baronne Prévost, her glory is departed," which is so too true. Sir Rowland Hill. Does it exist? has it ever existed? or is it what mathematicians call "an imaginary quantity?" or, is it one that

should be rescued from oblivion, as a souvenir of the great postal reformer? Rev. H. Dombrain, let us hope to retain the person but not the Rose for many many years to come. Géant des Batailles, Pauline Lantzeur, François Premier are of a tribe long since deservedly gone out of favour; flat, and with small notched petals when expanded, of varying and often dull colour, with little or no substance—there is no longer room nor necessity for them; Jean Rosenkranz, not half so good as its manifest parent, Jacqueminot, the "old Général" destined to brave many a rude buffet yet; Madame Boll, rough and coarse; La Reine, an old Rose hard to expand, producing an overwhelming per-centage of bad to good flowers, its place fully applied by Comte de Nanteuil, still a superb variety, Gloire de Vitry, and La Ville de St. Denis mentioned above; Triomphe de Caen and Merveille d'Anjou, neither a triumph nor a marvel at all. Duchesse d'Orléans must still have friendly remembrance, it is now completely eclipsed by the lovely Marquise de Mortemart. William Jesse recedes far into the earliest recollections of the oldest rosarians; to Rose annals it is almost prehistoric. Souvenir du Comte Cavour is still in favour with me on account of its colour, symmetrical form, breadth of petal, and robust habit. I yield to the judgment of many experienced growers and pass it by; it is surpassed in some respects by Xavier Olibo and Duke of Wellington, and infinitely so by Lord Macaulay, one of the most brilliant and attractive of all the crimson-scarlet Roses of this shade of colour. Monsieur Boncenne must also claim notice, although its remontant qualities are very defective, if not entirely absent. Alba carnea, Madame Pulliat, François Treyve, and Comte Litta have been weighed in the balances and found wanting. Joseph Fiala is praised by Mr. Keynes, but, I believe, he almost stands alone in his estimation of it. Madame Fillion does not yield flowers enough to pay for cultivation; it is very beautiful when it does come. Pius IX. fails. Charles Rouillard, Auguste Mie, and Reine du Midi, are a multiplication of varieties worthless compared with Chabillant, Thérèse Levet, La France, Dereux Douvillé, a neglected but fine Rose; and the robust William Griffiths. Anna de Diesbach was fashionable about the time that crinoline was à la mode, of which it may be said to be a synonyme. A floral critic, I forget who, once enunciated a very famous apothegm in these pages; it was, that "the graces of ladies should be imitated, not their garments." Crinoline is gone, Anna de Diesbach will soon disappear too. Le Géant and Jean Lambert are loose jaunty flowers soon to be forgotten. Thorin is still in debateable ground; with me in light soil it does no good. Felix Genero is still worse.

There are yet more in the list under notice that I have not reproduced. I cannot but think that so palpable an error in judgment as is shown in the article at pages 97 and 98 will be fully challenged and refuted by the able contributors to the Journal on Rose subjects, and that my own omissions will be amply made good by them. A few more remarks remain to be made. Following the section containing the list of Hybrid Perpetuals are six paragraphs assigned to as many different classes. Five varieties of Hybrid Chinas and Bourbons are recommended to the "many inquirers" to select, including Vivid and Paul Ricaut, both surpassed by many remontants of the same colour. Blairii and Charles Lawson are omitted, although superior to any of the five inserted. Few will now care to grow the Alba Roses, Félicité and Queen of Denmark, in preference to Acidalie, Souvenir de la Malmaison, Boule de Nègre, or even Baronne de Maynard, none of which receives a notice; and among Moss Roses the old Crimson will always be the most admired. Two Tea Roses only are mentioned—Gloire de Dijon, which everyone must have, and Homère, a peculiar but certainly not a good Rose. The pretty Céline Forestier, which can be grown almost everywhere, is left out. Marchel Niel, almost as hardy as Gloire de Dijon, is ignored; Sombrenil, a beautiful hardy white Tea Rose, finds no place; the useful free-blooming Narcisse, so easy to grow and propagate, is passed over. In fact, throughout the whole list the omissions are as extraordinary as the insertions.

Enfin, but no; let one glance be given to the descriptions, or, I should say, the colours of the different kinds named. "Brevity is the soul of wit," hence nearly all are described in single words. To select a few. Jules Margottin and Beauty of Waltham are "cherry." What did Mr. Radclyffe think of his "old jewels" being thus characterised? Alfred Colomb and Clémence Joigneux "red;" they are as much alike as the sun and moon, but then "red" is a comprehensive quality. Pierre Notting is "dark red." Paul Verdier, Madame C. Wood, Souvenir du Comte Cavour, and Prince Camille de Rohan are

all "crimson;" it would not be correct to say that they are not—it is equally untrue to say that they are and nothing else.—ADOLPHUS H. KENT.

PLANTS FLOWERING IN JULY.

LAWN MOWERS.

THE trial of lawn mowers is very important, and all lovers of a velvety and verdant lawn are deeply interested. I have

used only Green's 16-inch machine for some years; it is very hard work for two men. If the grass is long it cannot catch it, and fine short grass it almost tears up by the roots. During the past three years my grass plots have been much burnt up and very ugly; this made me desire a better machine. When the Archimedean was announced I wrote to inquire, and had one offered no cure no pay, and on trial I was glad to keep it and pay for it. My gardener, having been ill, is now only weak, so I volunteered to mow the grass, of which I have more than half-an-acre. I have mown it all myself during the past three weeks, with the exception of a small portion, which was cut last week with Green's machine by two men, but the result is very inferior. The grass left on by the Archimedean is a benefit; the turf improves and becomes like velvet. I can work the machine easily; it is a delightful implement, its work a success, and those who wish to know more may come and see or write. —THOMAS BAINES, *Stock House, Bingley.*

STRAWBERRIES WORTHY AND UNWORTHY OF CULTIVATION.

YEAR by year our Strawberry lists are extended, new and wonderful varieties coming upon us from every quarter; to grow even a dish of each would fill with plants an ordinary-sized garden. Variety is getting so abundant as to be perfectly embarrassing, and amidst so much variety there must necessarily exist much inferiority. If our Strawberries have been improved—and they have been so considerably—many sorts are thus superseded, and ought to be discarded and forgotten. To grow inferior sorts is certainly useless; to have to purchase such is more than vexing. Feeling that "to know what to avoid" is good knowledge, we subjoin a list of varieties which have come under our personal observation, both during the present and the last year, and which ought to be entirely discarded. Some of them may, perhaps, in certain localities, and for certain purposes, prove passable. We venture to say, however, they are but few, and that even these are improved upon and superseded. We have this season examined upwards of four hundred named kinds, and out of these we discard the following:—

A. Van Geert	Gélineau	Nimrod
Adair	Globe	Nonsuch
Admiral Dundas	Goländer	Old Chili
Ambrosia	Great Eastern	Orange Chili
Augusta Kitmeyer	Great Exhibition	Orb
Australia	Green's Prolific	Palmyre
Baronne DamsLanage	Hscquin	Patrick's Seedling
Beauty of England	Helena Jamsin	Peabody's Seedling
Beehive	Hendries, Seedling	Pearl
Belle Artoisienne	Henrietta	Pitmaston Black
Belle Cauchoise	Héro	Prince Charlie
Belle de Paris	Highland Mary	Prince Arthur
Bicolor	Hooper's Seedling	Princess Alice Mand
Blandford	Hovey's Seedling	Princess Fredk. William
Bostock	Iowa	Princess of Wales
Boston Pine	Jenoy Lind	Princess Royal of Eng-
Bonbon	John Powell	land
Bonté de St. Julien	Jucunda	Progrès
Boule d'Or	Jung Bahadoor	Richard II.
Brighton Pine	Kimberley	Robert Traill
British Queen Seedling	King Arthur	Roseberry
Britannia	Krsminsky	Rosebud
Brittany Pine	La Boule du Monde	Royal Victoria
Ceres	La Fertile	Ruby
Chinese	La Grosse Sacrée	Rusitoniensis
Choix d'un Amateur	La Negresse	St. Lambert
Cole's Prolific	La Paysanne	Sanspareil
Comte de Zans	La Perle	Savoireuse
Comtesse Theresa Kickx	La Petite Marie	Scott's Seedling
Comtesse de Marne	La Reine	Sir Walter Scott
Cornish Diamond	La Rustique	Stirling Castle Pine
Cornucopia	La Vineuse	Sultane
Cox's Hybrid	Ladies' Finger	Surpass Grosse Sacrée
Déjàne	Le Baron	Surprise (Myatt's)
Délices du Palais	Le Titans	The Lady
Délices d'Antoine	Lecoq Pine	Thomp's Seedling
Dr. Karl Koch	Léon de St. Lannier	Topsy
Deptford Pine	Leopold	Trolopp's Victoria
Douglas's Californian	Lorenz Booth	Triomphe
Duchesse de Besamont	Lord Clyde	Triomphe de Gand
Eliza Champion	Mon Gout	Unique Scarlet
Elton Pine Improved	Monstrouse de Robins	Versailleuse
Excellentes	Munro's Scarlet	Virgin Queen
Fairy Queen	Muscadine	Virginie
Fertile d'Angers	Myatt's Mammoth	Wellington
Filmora	Myatt's Prolific	Wilmet's Superb
Garibaldi (Nicholson)	Né Plus Ultra	Wizard of the North
General Havelock	Newton Kyme	Wonderful

the number is really not required, yet we here enumerate them as possessing some distinctive property. Those the most meritorious in our estimation we have marked with an asterisk *.

- *Ajax, very large, fine colour, splendid for forcing.
- Alice Nicholson, fine quality.
- Ascot Pine Apple, fine quality, early.
- Bicton Pine, best white.
- Black Prince, useful early sort.
- *British Queen, finest quality, suitable for some soils.
- Comte de Paris, splendid colour and texture.
- Crimson Cluster, Hautbois flavour.
- *Dr. Hogg, finest quality, large, fine constitution.
- *Duc de Malakoff, the largest of all.
- Duke of Edinburgh, large and very handsome.
- Duke of Edinburgh (Moffat's), very large, fine market sort.
- *Elton Pine, best late-preserving.
- Empress Eugenie, great bearer, large size.
- *Frogmore Late Pine, excellent late variety.
- *Gloria, excellent early sort, fine flavour.
- Grove End Scarlet, good preserving.
- Har Majesty, large and handsome.
- Highland Chief, excellent quality.
- *Keens' Seedling, one of the best for forcing.
- Kitley's Goliath, great bearer in some soils.
- *La Constants, finest quality, remarkable habit.
- *Lucas, very large, fine constitution and quality.
- May Queen, the earliest of all, but very small.
- *Mr. Radclyffe, large and excellent.
- Myatt's Eleanor, fine appearance, late.
- *Myatt's Eliza, finest quality.
- Old Scarlet, good preserving.
- *Oscar, fine quality, splendid colour.
- *Old Pine, fine quality, distinct character, bears well in the shade.
- Perpetual Pine, interesting as a variety.
- *Premier, fine quality, great bearer.
- President Wilder, large, handsome.
- Prince of Wales (Cuthill's), extraordinary bearer, late.
- Rifleman, great bearer, large.
- Royalty, fine quality, great bearer.
- Scarlet Cluster, fine colour, good quality.
- *Sir C. Napier, most profitable for the London market, excellent for forcing and general purposes.
- *Sir Harry, large, splendid cropper, fine market sort.
- Sir J. Paxton, excellent variety.
- Souvenir de Kieff, very handsome, large.
- *The Amateur, very large, enormous bearer.
- W. J. Nicholson, fine quality, large.
- Waltham Seedling, enormous bearer, good.
- *Vicomtesse Héricart de Thury, the most generally useful.

Synonymes are not here given. There are, in addition to both of these lists now given, a great number of varieties which may be termed of mediocre quality, but sufficiently good for retention in large collections, or for some particular use, or for being specially suited for some particular soil or district; also a never-ending stream of novelties, or so-called improvements, or repetitions of the same under other names; likewise many others which have never come under our observation, as we write only of our own knowledge and experience.

DOUBLE GERANIUMS.

I CANNOT agree with "D., Deal," that the double Geranium is good for bedding purposes, for as Mr. Abbey justly says in his article last week, the centre of the trusses is very apt to clog and mildew in wet, and turn black in dry weather. I have tried several varieties, and found all fail, even the double Tom Thumb; this Mr. Abbey thinks might do. But there is one purpose I find them very suitable for, and that is window plants, as they remain a very long time in bloom, and the centres of the trusses, being perfectly dry, scarcely change colour, while they have the advantage of retaining their petals until removed altogether, and having this property they are also very suitable for button-hole flowers.

I have grown the following in my window this year—Gloire de Nancy, Smith's Victor, Victor Lemoine, Marie Lemoine, Madame Lemoine, Vésuve, and Wilhelm Pfitzer. Of these I think Marie Lemoine the best light colour, being so compact in its growth, but Madame Lemoine is also good. Gloire de Nancy ought to be kept dry to prevent its growing too strong, and it will then open well. Victor Lemoine is by far the best and brightest of the scarlets, a very good trusser, and of dwarf habit. Vésuve is of the same colour and shape as Smith's Victor, but not so dwarf in habit, but both heavy in colour and small in truss. Wilhelm Pfitzer is also a dull red, ragged in form

We next furnish a shorter, yet sufficiently extensive, list of those varieties which have proved sufficiently meritorious for some purpose or other to warrant their retention. One-tenth

of flower, and rather a strong grower. So I retain but two as first-class, Victor and Marie Lemoine, and Madame Lemoine and Gloire de Nancy where more height is wanted. Growing these varieties in a window they are apt to draw a little, which prevents the flowers being too closely packed, so they open much better, and have a finer effect, and being in a cool atmosphere last in bloom a very long time.—HARRISON WEIR, Weirleigh, Kent.

HORTICULTURAL CONGRESS AT OXFORD.

(Continued from page 104.)

THE following paper by Mr. Thomas Moore, F.L.S., was read on the second day of the Congress, and is of much interest to those who have to act as judges, as well as to exhibitors.

ON JUDGING PLANTS AND FLOWERS.

THE object of this paper is to bring out as briefly as possible, and rather in a suggestive than an exhaustive manner, a few practical thoughts in reference to the more important of the laws which should regulate the judging of plants and flowers at horticultural exhibitions. The subject is one of the greatest importance, and it is also so extensive that I can do little more than touch upon some of the more salient points. To do this effectually, it will be necessary to treat separately of:—I. Plants staged in collections; II. Plants staged as individual specimens; III. Plants and flowers staged as novelties; IV. Flowers staged in the cut state.

§ I.—As examples of the subjects which fall under the head of Plants staged in Collections, the groups of Pelargoniums, Heaths, Roses, Orchids, miscellaneous stove and greenhouse plants, &c., may be cited. In judging groups of this character, the following points should be carefully estimated, and their true value credited to the several collections, in the following order:—

1. *Conformity with the Terms of the Schedule* under which they are shown. This, it must be evident, is the first and most important point to be decided, since, if the group, as a whole, or in respect of any of its component parts, does not meet the terms under which it has been invited, it is at once removed beyond the pale of competition, and must be set aside or disqualified. On this account it is of the utmost importance that prize schedules should be explicitly and clearly worded. Moreover, in making up a schedule, undefined groups should be avoided. They are fair neither to exhibitors nor judges; the former are uncertain what to stage, the latter cannot possibly compare and adjust the points of merit between objects which are not comparable.

2. *Health and Vigour*.—Plants which are in an evidently sickly or moribund condition are not likely to be often exhibited, but when they are, they are to be regarded as blots and blemishes. What are more likely to be seen at exhibitions are old, worn-out, debilitated specimens—plants which have served a good purpose in their day, and which still have, it may be, the recommendations of size, and of producing abundance of blossoms, but beneath which the experienced eye can detect the signs of decrepitude. Such plants as these should not be preferred before younger and more vigorous specimens merely because they happen to be larger, if the younger plants are fairly over what would be known as half specimen size, and are otherwise good examples of cultivation as to growth and bloom. In other words, young vigorous growth, with its robust, high-coloured flowers, is to be preferred to stunted growth and starved flowers, even though the plants may be considerably smaller. This is equally true in respect to plants grown for their foliage; vigorous youth must here also come before stunted old age.

3. *Freshness and Unimpaired Condition*.—The foliage of exhibition plants should not only be well-developed, but fresh and in an uninjured state; the flowers should be perfect, and without blemish. Such plants come decidedly before others that from any cause may have become bruised, broken, or disfigured, as regards either stem, leaves, or flowers. Injuries of this sort chiefly occur in packing and transit, but all such defects must count as decided blemishes.

4. *Intrinsic Beauty*.—This may be of two kinds, floral beauty or leaf beauty, and both may sometimes count in the same group. Thus in a collection of miscellaneous flowering plants, while flowers are essential, and the floral display may carry high marks, yet where elegant or ornamental foliage is associated with these handsome flowers, still higher marks must be allowed. In florists' subjects, Pelargoniums or Fuchsias for example, on the other hand, the floral beauty of the subjects has mainly to be considered, the foliage being similar in all, while any differences it may present will have been estimated under the heads of health and freshness. Singularity of form may sometimes compensate for want of colour beauty. There may also be subjects whose beauties, such as they are, are of a plain or ordinary character, and which are not therefore effective; and such plants count rather as blemishes than otherwise.

5. *General Compatibility*.—In all collections there should be an evident fitness of plant to plant, a general resemblance, though not necessarily a rigid uniformity of character, especially as to size, quality, and style. Sometimes in marshalling his forces an exhibitor will bring into his collection some one or two magnificent specimens as a makeweight against sundry inferior ones, and with inexperienced

judges the artifice now and then succeeds, since they cannot free themselves from the impulse to reward the superior plant or plants. This, however, should always be discountenanced, and a certain average amount of merit throughout the group, higher or lower according to circumstances, insisted on. The whole of the plants in the group, whether many or few, should fit into their respective places as though they had been prepared for them. There may be some larger to occupy the back or centre of a group, and some smaller to take the front places; but there should never be one or two very large plants mixed up with several very small ones, nor one or two small plants associated with several large ones. If there cannot be an approximate equality of size, there should be a gradation, and that not too sudden. As to the form of individual plants, that must vary to some extent with the subjects, especially in miscellaneous groups, but the contrast even here should not be too violent; and in the case of collections of particular flowers, as Pelargoniums, Roses, &c., there should be an approximation to symmetry and uniformity of outline, as well as of size.

6. *Size* should only count where other conditions are equal. In urging this point, it is not intended to depreciate fine, large, and really healthy specimens, since these, of whatever kind, are the pride and glory of our plant shows, but only to insist that mere size is never to be preferred to perfect health and irrefragable condition and finish. The old proverb comes in very true here—the biggest not always the best. Size is of course comparable only between different classes, some subjects naturally attaining larger dimensions than others.

7. *Rarity* is an element which must be allowed to have weight after the few first and most essential points. There must be some variety, and the greater the variety after the essential points are met the better; but beyond the avoidance of positive sameness too much importance must not be attached to the mere circumstance of a group being highly varied. This is one of the points upon which schedules should be made especially clear, so that it may be thoroughly understood if distinct species or varieties are required, and whether or not duplicates are admissible.

8. *Facility of Culture*.—The least weight should be attached to the plants which are most easily cultivated, other points being equal, though, as a considerable amount of skill is necessary to bring any plant into a state fit for exhibition, too much importance should not be attached to plants of difficult culture. An easily grown plant, thoroughly well done, perfect in every point, may even be better than a moderately good plant of a more difficult subject, and is certainly better than an inferior one of that class.

9. *Rarity and Intrinsic Value* take about the same position as facility of culture and variety. All these may be, and should be, taken into account, but they are scarcely essential, and certainly not of primary importance. Rarity is the least important of them all, since it may add nothing to the beauty of the show; and the money value of the objects is not the ground upon which the plants are brought into competition. As auxiliary points in collections that come near together in merit, these may be fairly considered; but certainly too much importance should not be attached to them. Horticultural exhibitions are held for the display and reward of cultural skill, not for the appraisement of the objects shown. The latter is a consideration more suited to an auction-room than a flower show.

§ II. The considerations which give importance to the several points of merit in the case of plants staged as Individual Specimens, and which may include such subjects as Azaleas, Heaths, Pelargoniums, Orchids, Palms, Ferns, or any of the plants included in miscellaneous collections, are almost, if not exactly, the same as those already advanced, and therefore need not be repeated. They should be taken in the order indicated, and perfection in each should in these cases be insisted on.

1. *Conformity with the Terms of the Schedule*.

2. *Health and Vigour* as opposed to weakness and infirmity.

3. *Freshness and Unimpaired Condition* as opposed to decay and mutilation.

4. *Intrinsic Beauty*, which must here include, so far as they properly attach to the particular kind of plant under examination, such points as free and symmetrical habit, profusion of well-displayed flowers, pure or pleasing colours, firm and enduring flowers, and succession of bloom,—points which will be more specially noticed under § III. New Plants.

5. *Facility of Culture*.

6. *Size*.—The comparison in respect to size must not be absolute but relative, in those classes where mixed subjects compete together.

7. *Rarity and Intrinsic Value*.—Where specimens of one particular kind of plant—say Azaleas or Heaths—are brought together for adjudication, there is comparatively little difficulty in arriving at a correct decision by such stages as those indicated by the foregoing points; but it is not so easy to arrive at a satisfactory conclusion in the case of miscellaneous specimens when shown together in the same class, since the consideration of the value of the plant will obtrude itself, and will affect different minds in a different manner, according to peculiar tastes or fancies. Hence, at least special subjects, Orchids for example, which generally bear a high money value, should have separate classes assigned to them, and should not be left open to compete with such plants as Fuchsias, or even such as Ixoras, Allamandas, &c.

§ III. The considerations which should govern the award of prizes

to New Plants and Flowers—that is, subjects staged as novelties, have been already noted in a paper published in the first volume of the Society's Journal, but in order to present a more complete view of the subject, I will here briefly recapitulate what I have therein advanced.

(a). **FLOWERING PLANTS.**—The features which are the most desirable in a plant cultivated as a decorative object for the sake of its flowers—that is, in an ornamental-flowering plant viewed as a whole, are the following:—

1. *Free and Symmetrical Habit of Growth.*—Whether naturally slender or robust an ornamental plant should at least be free in the development of its parts, and should present something like regularity in its growth, so far as that can be realised in conjunction with its natural habit. The plant should not be of a stubborn immovable character, resulting in a stunted aspect, nor must it be of a delicate constitution, such as gardeners call "miffy." In a general way it should be compact and bushy, so far as its natural character permits—the opposite of lean and straggling in its mode of growth. Sometimes, it is true, a bad habit may be overcome by the skill of the cultivator, but it is better that a good habit should be inherent. Even in a climber, lanky long-jointed growth is not desirable.

2. *Profusion of Flowers well displayed.*—There should not only be an abundance of flowers produced, but they should be so disposed as to be effective; that is, they must not be hidden amongst the foliage, nor, if their beauty depends upon a view of their face, must they hang about loosely so that the face cannot be seen. If they are pendent, it should be with natural grace. They should not be crowded by foliage, nor crushed among themselves by being over-numerous or disadvantageously set on.

3. *Healthy Leaf-development.*—No plant can be really beautiful which has not well-grown and well-coloured healthy foliage; but the leaves should generally be subdued in comparison with the flowers, and must not in any case be disproportionately large or numerous. If the foliage is handsome, so much the better, but it must be healthy and wholesome-looking.

4. *Bright, pure, dense, or pleasingly-contrasted Colours.*—All dull dingy colours stamp a flower with inferiority, though they may sometimes be permitted as curiosities, especially if the flower is of some very remarkable form in its family, or presents some peculiar novelty.

5. *Form and Substance of Flowers and Embellishments.*—Unless flowers put on some of the best forms which their particular type may be capable of yielding, and are stout and durable in texture, they neither present the highest beauty of which they are capable, nor do their beauties, of whatever order, continue. Flimsy flowers soon perish, and are hence much inferior to those of stout enduring substance.

6. *Succession of Bloom.*—It is a greater merit to produce a succession of flowers, in order that the blooming season may be prolonged, provided they are not thereby rendered scanty and scattered, than to give a flush of flowers, the beauty of which is fleeting, and then not to blossom again for a considerable period. Next in merit to a plentiful succession of flowers comes a good head of bloom; and these plants are of the least value for ornamental purposes which only bear a few scattered blossoms at long intervals of time.

7. *Size of Flowers* is an advantage, all other points being equal; but size is apt to degenerate into coarseness, and hence it is not a feature to be estimated too highly.

8. *Distinctness.*—If it were not for the development of this characteristic, our flowers would lack half the charms they now have, owing to the almost endless variety they present; and hence this feature of distinctness should be made a *sine quâ non*. A new flower which has not appreciable distinctness has no advantage over the older ones which resemble it.

9. *Grateful Odour.*—A pleasant perfume is a great advantage in any flower, and must have its full weight in making any award to a new plant.

10. *Novelty.*—A decidedly new character is worth recognition in the absence of any other merit; for if the plant presenting it does not in other respects give us exactly what we desire, the new feature is to be regarded as the first step towards obtaining a new race; and to produce a new race is equivalent to the addition of a new province to the kingdom of Flora. If the new feature is some manifest improvement so much the better, but a new feature, though not in itself a direct and present advantage, may lead to something which is desirable. When, moreover, it is made an aim to develop, in connection with the novel character, the elements of beauty or utility, in which it may be deficient, this aim will in almost all cases be sooner or later realised, owing to the plasticity of vegetable development.

(b). **FOLIAGE PLANTS.**—In regard to plants grown for the sake of their foliage, many of the points of merit are the same as those sought for in flowering plants. The most desirable features appear to fall under the following heads:—

1. *Free and Symmetrical Habit of Growth.*—This feature is even more essential here than in the case of flowering plants, as great part of the beauty of the specimen necessarily depends upon it.

2. *Healthy Leaf-development.*—As the beauty of the plant is to be sought in its foliage, the leaves must at least be developed in a healthy and vigorous manner.

3. *Growfulness or Nobility of Aspect.*—Most of the plants grown for foliage alone are prized on account of one or other of these features. Hence a common-looking plant which does not possess either one or

the other, and does not yield showy flowers as a compensation, must be held to possess little merit from the decorative point of view, however curious or interesting it may be in other respects.

4. *Endurance of Foliage.*—When the beauty of the plant depends on the appearance presented by the foliage, it is obvious that the more enduring the character of that foliage, the longer will the plant retain its beauty. Hence endurance in the foliage becomes a very important quality. A deciduous plant is on this ground less valuable *per se* than an evergreen, although it may be good in its way, or in its season. But, then, evergreens and deciduous plants are not strictly comparable.

5. *Distinctness.*—When the beauty of a plant has to be sought in its leafage alone, there is much less scope for variety than when flowers are interspersed; but it becomes all the more essential to avoid the sameness of aspect which must prevail, if distinctness of character is not insisted on.

6. *Pleasing and Well-marked Colour.*—The leaf, that is to say, should, if green, be a good pleasant healthy-looking green, and if of any other colour, it should be of some decided and agreeable tint or tone.

7. *Well-defined Colours or Marblings.*—This is an essential part of beauty in the case of variegated leaves, and variegation is a condition commonly presented by what are called ornamental-foliaged plants. A cloudy intermixture of colours in leaves, as in flowers, is seldom or never effective.

8. *Novelty of Character.*—Though only to be valued as the stepping stone to the production of new races, as in the case of flowering plants, yet when combined with other elements of beauty, or as indicating features which may be improved upon and worked up to greater perfection, this is a property much to be desired.

It may here be observed that stove plants, greenhouse plants, and hardy plants require to be judged independently of each other. At first sight it might appear needless to estimate separately the merits of these several groups, since it might be said that hardy plants, the lowest in value intrinsically, stand really at an advantage in being suited to the means of a larger number of cultivators than would be able to accommodate hothouse plants, owing to the more costly nature of the conditions necessary to the successful production of the latter; while to some cultivators, who cannot command any such costly appliances, they would, of course, be all in all. On the whole, however, the several classes may be placed on an equality in so far as concerns the judgment on their merits as new plants; for whilst an advantage must be admitted in the case of the harder subject, on the ground of its more general applicability, an advantage must certainly be accorded to the hothouse plant on the ground of intrinsic value. But still I would urge the adoption of this rule, that plants of the classes denominated stove, greenhouse, and hardy, should be compared only among themselves. This limitation should indeed be carried further, for annuals, perennials, and shrubs or trees should in the same way only be compared amongst themselves; and of the latter, deciduous plants and evergreens can only be fairly compared with plants corresponding in character. The same may be said in reference to plants of any specially-marked group, such as Agaves or Orchids. To ascertain if a hardy Conifer was of first-class merit, it would be useless to compare it with a Fern or a Palm.

Further than this, plants adapted for blooming in the winter, or spring, or summer, or autumn seasons, must be judged in their relations to those particular seasons, and must not be rigidly compared except with those of their own season, because, in order to avoid a scarcity of flowers at any period, it is necessary to cultivate such as will extend the flowering period throughout the year. A plant may thus be really valuable on account of its blooming in winter, which would be regarded as comparatively worthless in summer, for the mere fact of producing blossoms during winter is sufficient to outweigh a multitude of minor defects. Hence may be deduced another conclusion—namely, that the rules by which new plants are judged must be relaxed in inverse proportion to the supply of flowers obtainable at the particular season at which they bloom. These general considerations must be allowed their full force in applying any set of rules for the determination of the merits of new plants.

(c). **FLORESTERS' FLOWERS.**—Though various in character, these admit of more ready and exact comparison than the subjects of the two preceding groups; for the number of organs to be adjudicated upon are fewer, and hence the requisite features admit of more exact comparison and definition, which definition has been already well worked out by florists. The features to be specially sought, and their relative value, are these:—

1. *Form.*—In most single flowers this should be circular, or, where the circle will not apply, symmetrical. In double flowers there should be a semi-globular outline. Compound flowers follow the same law as double flowers. Tubular flowers, and some others of peculiar form, offer exceptions, which can only be dealt with individually.

2. *Substance.*—The texture of the petals must be stout and dense if the flower is to be durable, for if flimsy it soon gives way, and loses both form and colour.

3. *Smoothness and Flatness of Edge and Surface.*—These qualities are eminently necessary to give refinement to the flower. A coarse rough-surfaced flower bears no comparison with one of a velvet-like smoothness and softness, and evenness of margin is equally necessary. A regular series of wart-like spots, as in the case of some Lilies, is,

however, admissible. In some cases, but not often, a well-developed fringe or frill is also admissible.

4. *Colour*.—This must be bright or pure and decided in self-flowers (that is, flowers of one colour), and clearly-defined and well-contrasted in striped or laced flowers.

5. *Fidelity of Colour* is a quality of some importance, and depends partly, but not wholly, on the texture or substance of the corolla.

6. *Proportion of Parts to the Whole* is an essential element of beauty, but, as this depends on the actual form, it must be defined individually in the different kinds of flowers.

7. *Size* is an advantage, so that it is not disproportionate nor conducive to coarseness, but it is very apt to degenerate into coarseness.

8. *Distinctness* is absolutely necessary for the sake of variety.

9. *Novelty* is a quality always welcome, as it enlarges the field of floriculture; but to count as a point in judging the change must not be a mere variation, but a decided difference of form or feature. The merit of any novelty of feature, moreover, must always be estimated subject to the higher qualities of form, substance, smoothness, proportion, &c.

§ IV. Cut flowers for competition are always shown in collections—*e.g.*, Roses, Carnations, Pansies, Gladioli, Hollyhocks, Asters, &c. Hence, many of the points advanced under the head of Plants staged in Collections (§ I.), apply to these also; but there are additional points, such as those advanced under New Florists' Flowers (§ III. c.), and over and beyond all these come in the special properties of each particular kind of flower. Time will not permit me to enter into detail on these points, and I will therefore merely mention those which are of general application, or nearly so:—

1. *Conformity with the Terms of the Schedule.*
2. *Freshness, and Unimpaired Condition.*
3. *Special Properties of the particular flower under judgment, and more particularly as regards:—Form, substance, smoothness of texture and margin, purity and definition in colour.*
4. *Variety.*

The only strictly accurate mode of judging is by allotting marks to each collection or plant in respect of each point of merit, and finally summing up the total. This may seem a tedious method of arriving at a result, but it need not be so in reality; and it is practically the method under which, by means of a mental process, our best judges arrive at their decisions. When this plan is adopted there is no guesswork, but the sum of the merits of a plant or a collection must come out accurately. I can only here briefly indicate how the method may be applied:—

In Section I., that is, Plants staged in Collections, the first point settles whether the collection is admissible or not—nonconformity with the schedule means disqualification. The other points must be gone over *seriatim*, and a decision arrived at whether each plant can be marked as good, bad, or indifferent, in respect to each point. As the points are not all equal I would allow double marks for the points of primary importance, and single marks for the secondary ones. Under the former good would be represented say by 6 marks, indifferent by 3 marks, bad by 1 mark. Under the latter good would stand at 3, indifferent at 2, bad at 1. With a little practice these numbers would be soon run out, even in a collection of a dozen or a score of plants, especially if prepared slips with columns for the different points were handed to the judges previous to their commencing their duties. I should put the points numbered 2, 3, 4, and 5 (health, freshness, beauty, compatibility), in the first category, and 6, 7, 8, and 9 (size, variety, facility of culture, rarity, and value) in the second, as regards collections of flowering plants; and 2, 3, and 4 (health, freshness, beauty) in the first, and 5, 6, and 7 (facility of culture, size, rarity) in the second category, as regards specimen plants. In this way the decisions in §§ I. and II., and even § IV may be very accurately made out, these groups being all competitive.

In the case of new plants the subjects require a different treatment, the object being to determine their intrinsic, not their comparative merit. Here, consequently, a fixed number, say 100, should indicate the highest degree of excellence, and any lesser number awarded will show the degree in which they approach this highest degree of merit. Practically those plants which gain 75 marks or upwards would be 1st class in merit; those which gain over 50 up to 75 would be 2nd class; and those which gain only from 30 to 50 would be 3rd class. In these cases the full number assigned to each meritorious feature is only to be awarded to the perfect condition of that feature, and any lesser proportionate number according to the actual degree of merit.

In reducing this to practice, the following would be the marks indicating the highest degrees of excellence in the case of New Flowering Plants:—

1. Freeness of habit	15	} = 100 marks.
2. Profuseness and display of flowers	15	
3. Healthiness of leaf-development	15	
4. Purity, brightness, or contrast of colour	10	
5. Endurance, substance, and form of flowers	10	
6. Succession of bloom	10	
7. Size of flower	10	
8. Distinctness of character	5	
9. Gratefulness of odour in leaves or flowers	5	
10. Novelty of a decided kind	5	

Glaring defects amongst new flowering plants would be presented by the undermentioned peculiarities, each of which should reduce the award by 10:—Straggling habit, flimsy flowers, muddled or dingy or fleeting colours, fetid odour.

The following is the scale proposed for New Foliage Plants:—

1. Freeness of habit	15	} = 100 marks.
2. Healthiness of leaf-development	15	
3. Gracefulness or nobility of aspect	15	
4. Endurance of foliage	15	
5. Distinctness of character	15	
6. Agreeableness of colouring	10	
7. Definition in markings	10	
8. Novelty	5	

As glaring defects which may occur in this class of plants, may be mentioned the following peculiarities, each of which should reduce the award by 10:—Straggling habit; flimsy, tender, rapidly perishing leaves; indistinct or fleeting colours or markings.

In the case of New Florists' Flowers, the points of excellence would bear the numerical ratio indicated below:—

1. Form	15	} = 100 marks.
2. Substance	15	
3. Smoothness	15	
4. Colour	10	
5. Fidelity of colour	10	
6. Proportion	10	
7. Size	10	
8. Distinctness	10	
9. Novelty	5	

The most glaring faults in this class of subjects are to be found in the following features, which are in most cases altogether incompatible with a high position:—Open eyes, as they are called, when double flowers show any part of the disc or centre; split petals or florets; run or confused or fading colours; roughness of outline or surface.

THE last paper which we shall give is that of Professor Lawson, which was read on the second day of the Congress.

OXFORD BOTANISTS.

HAVING been honoured with a request that I would write for this occasion a short paper, I chose for my subject "The History of the More Eminent Botanists and Gardeners connected with the County." But had I written my paper first, and then selected my title, instead of adopting the opposite course, I should have entitled it, "The History of the More Eminent Botanists and Gardeners connected with the University;" for when I came to examine the subject more closely, I found the amount of information that might be given was so great, that to do it justice I should require several papers in which to treat it, instead of one.

Thus I have to apologise for having departed in some degree from my original intention.

I will make use of this opportunity, and take the liberty of suggesting to the Committee the propriety of engaging, on each succeeding year, the services of some person well acquainted with the history of the city and neighbourhood in which their meeting may be held, who shall undertake to give us a short account of all who have advanced the botany or horticulture of their county. By these means we should gain a vast amount of valuable information that might otherwise be irretrievably lost; while many a name worthy of being chronicled would also be saved from oblivion.

The first item of interest connected with this place, to which I will now direct your attention, is the founding of the Botanic Gardens, by Henry Earl of Danby, in the year 1632.

This event established a new era in British botany; for, with the exception of a private physic garden belonging to Gerard in Holborn, none in England as yet had been set aside for scientific purposes.

Lord Danby obtained from Magdalen College a lease of nearly five acres of ground, which he surrounded with the present noble wall, and built the gateway that adorns the principal entrance to the gardens. He erected, also, greenhouses and stoves for exotics, and a house for the curator, Bobart, whom he appointed as the first curator. At his death, also, this generous nobleman added to his former liberality by bequeathing the rectory of Kirkdale in Yorkshire, from the funds of which he hoped to maintain the efficiency of the gardens, and secure the services of a professor.

Bobart, of whose name I have already made mention, was a German by birth, having been born at Brunswick. On his appointment as superintendent he set himself most industriously to fill the new gardens with all kinds of rare plants, both English and exotic; and in the year 1648 he published a catalogue in which he enumerates no less than 1600 species as having been grown by him at that time. Of these, however, many were doubtless only varieties; but even after allowing a liberal margin for them, the number must have been great for one man alone to have collected, in those days, in so short a time. Ten years afterwards he republished his catalogue, with the assistance of his son; Dr. Stephens, then a Fellow of New College, afterwards Principal of Magdalen Hall; and Mr. William Browne, who was afterwards Senior Fellow of Magdalen College. The number of species in this second list was greatly increased, but owing chiefly, it would appear, to a number of palpable varieties being raised to that rank. The great value of this work lies in the plan which was here first adopted, of quoting the synonyms of other authors, and of giving references to the pages of their works.

Jacob Bobart died at his house in the gardens, in the year 1679, at the advanced age of 81.

Although the gardens were begun in 1632, and Bobart appointed to them, Lord Danby's second intention of establishing a professorship

was not accomplished till the year 1669; owing partly to the unhappy state into which the country had fallen in those times, and partly owing to the insufficiency of the funds arising from the estate in Yorkshire. But in this year Dr. Robert Morison received from the University his appointment to the chair.

Morison was a Scotchman, born at Aberdeen in 1638. In that town also he received an education which it was intended should fit him for the Church. But finding the study of theology less in accordance with his tastes than that of physic, he fitted himself for that profession instead; and his reputation rose with such rapidity among the learned, that, before he was thirty years old, he was chosen by Charles II. as king's physician.

In his younger days he had espoused the Royal cause, and fought in the battle at Brigg, near Aberdeen, where he was dangerously wounded in the head. In consequence of this display of his loyalty he was compelled to fly from his native country and take refuge in France. While there he was brought under the notice of the Duke of Orleans, who, quickly perceiving his merit, appointed him superintendent of his gardens at Blois, and furnished him with the means of travelling through France, in order that he might collect plants and information.

During his stay in France he published a new edition of the "Hortus Bolesensis," in which he sets forth his new method of classification. From this work he gained much honour among the scientific men of the day; and it established his character as an original writer and thinker. On the restoration of Charles II. he returned to England, though earnestly solicited to remain where he was.

On his appointment to the professorship at Oxford he commenced a course of lectures, consisting of three every week during the summer and autumn terms. From this time to his death he occupied himself chiefly with the preparation of his "Historia Plantarum Oxoniensis." Of this work, however, he lived only to complete a portion, his life being cut short by an accident that happened to him while crossing a street in London. He died in the year 1683, and lies buried in the church of St. Martin-in-the-Fields, Westminster.

After Morison's death Jacob Bohart, son of the first carator, was appointed professor in his place. He finished the second volume of Morison's "Historia Plantarum," and in the preface of this book he gives an interesting account of all the botanical authors, both English and foreign, who had flourished up to that time. He appears to have been a man of some humour, for Dr. Gray, in his edition of "Hadibras," relates the following amusing story concerning him. He says:—"Mr. Smith, of Bedford, observes to me upon the word 'Dragon' as follows:—Mr. Jacob Bohart, Botany Professor of Oxford, did, about forty years ago, find a dead rat in the physic garden, which he made to resemble the common pictures of dragons, by altering its head and tail, and thrusting in taper sharp sticks, which distended the skin on each side till it mimicked wings. He let it dry as hard as possible. The learned immediately pronounced it a dragon: and one of them sent an accurate description of it to Dr. Malibechi, librarian to the Grand Duke of Tuscany. Several fine copies of verses were wrote on so rare a subject. But at last Mr. Bohart owned the cheat. However, it was looked upon as a masterpiece of art, and as such deposited in the museum, or anatomy school, where I saw it some years after."

Whether the Ashmolean Museum or Dr. Rolleston still possesses this variety I cannot say; but if not, I can, unfortunately, produce abundance of material from the same place, for any who may again be inclined to exercise their ingenuity. Bohart died in 1719, being 79 years old.

The next botanist of whom I have to speak is Dr. William Sherard, or Sherwood. This indefatigable worker and liberal patron was born at Bushby, in Leicestershire, in 1659. From the Merchant Taylors' School, where he laid the foundation of his knowledge, he matriculated at St. John's College; and in his twenty-fifth year was elected Fellow of the same Society. Leaving Oxford, he travelled as tutor to Lord Townsend, on the Continent, and there made such excellent collections as won for him the esteem and friendship of Ray. The encomiums passed upon him by this immortal naturalist served to increase his ardour, and we find him next making tours throughout England and the Channel Islands in search of new and rare plants, which were communicated to Ray for insertion in his "Synopsis Plantarum." About the year 1702 he was appointed consul at Smyrna, and the opportunity being thus offered him of collecting Eastern plants, he set himself with wonderful diligence to obtain all that were to be had from Naxos and Greece. These collections were the beginning of that magnificent Herbarium, which, with his Pinax, made his name to stand so high amongst botanists. After residing in Asia fifteen or sixteen years, he returned to England in 1718, when the University, in consideration of his learning, conferred upon him the degree of Doctor of Law.

Remaining in England a few years, he again visited the Continent, travelling through Holland, France, and Italy, renewing personal intercourse with his older friends, and making the acquaintance of those with whom he had before only corresponded. Amongst these latter stood Dillenius, for whom he soon learned to entertain so high a regard that he persuaded him to come over and cast in his lot with him in England. Here he directed his studies, urging him in particular to turn his attention to the cryptogamic portion of the vegetable kingdom—a class of plants that had as yet been greatly neglected, and, in consequence, but little understood. Although possessor of ample means that had been accumulated by him during his residence in Smyrna,

Sherard lived with the greatest contentment in London, devoting his whole time to the study and arrangement of his collections and the advancement of his Pinax. Shortly before he died he gave £500 to the Botanic Garden, for the enlargement of the conservatory, and otherwise testified to his zeal for botanical science, as well as to the love he bore for his "alma mater" by presenting to the gardens a great number of new and rare plants, and by endowing them with his curivalled collections of dried specimens, and with his library of botanical works, perfect for the time in which he lived.

On his death, in 1728, he left by will £300 to provide for a professor, stipulating that the University should add annually to that sum £150 for the maintenance of the garden and library, and that Dillenius, his friend, should be elected to the chair. The bargain was accepted by the University, and John Jacob Dillenius was elected professor. He was a native of Darmstadt, and was born in the year of our Lord 1687. He received his education at the University of Giessen, and practised in that city as physician, occupying himself also with the study of botany, and publishing the results of his observations in the "Miscellanea Curiosa" or the papers of the "Academia Curiosorum Germanica," a Society into which he was elected at a very early age. But the work that contributed mainly to bring him into notice was his "Catalogue of Plants growing in the neighbourhood of Giessen," published in the year 1719, and it was probably owing to this work that Sherard was led to form so high an opinion of him, and to desire so earnestly to gain his permanent assistance.

Of the manner in which Dillenius was persuaded by Sherard to leave his native land, and return with him to England in 1721, I have already spoken. His effort, after settling down in his adopted country, was a new edition of Ray's "Synopsis Stirpium Britannicarum," with some improvements of his own. During the life of Sherard he lived chiefly with him in London, or with his brother James Sherard, who had an estate at Eltham in Kent, and who took such pleasure in botany and horticulture, that his garden was said to be the richest of the time in England. While staying in this congenial place, Dillenius projected an illustrated description of all such plants as were new or rare growing in this garden, a work he afterwards published under the title of "Hortus Elthamensis." In this work he describes and figures with wonderful accuracy and faithfulness 417 plants, and quotes the synonyms of other authors.

In 1728 his friend and benefactor died, and he removed to Oxford, where he was chosen Professor of Botany in the University, according to the agreement made by Sherard. His first desire and highest ambition was thus realised. In 1736 Dillenius was visited by Linnæus, who was then a young man, and had been sent over by Clifford to collect plants for his garden in Holland. Dillenius, who had thoroughly imbibed the doctrines inculcated by Ray, had naturally no love for one who was, as he supposed, endeavouring to upset his system, by introducing a new one of his own. Consequently, it was with no very friendly feeling that he first made his acquaintance. But how long this unfriendliness lasted may be best inferred from the following passage, which I will quote from the "Diary of Linnæus." He says:—"In 1736 Linnæus went over to England at the expense of M. Clifford; and here he saw not only the gardens at Chelsea and Oxford, but also procured many of the rarest and nondescript plants sent thither. He likewise became acquainted with all the learned at that time in the kingdom. At Oxford, Linnæus was received in a friendly manner by Dr. Shaw, who had travelled in Barbary, and who declared himself a disciple of Linnæus, having read his system with great pleasure. The learned botanist, Dillenius, was at first haughty, conceiving Linnæus' 'Genera' (which he got half printed in Holland), to be written against himself. But he afterwards entertained him a month, without leaving Linnæus an hour to himself the whole day long; and at last took leave of him with tears in his eyes, after having given him the choice of living with him till his death, as the salary of the professorship was sufficient for them both."

Can anything be more touching than this description of the change of sentiment that Dillenius manifested towards the young man he had at first looked upon as an innovator, and one personally hostile to himself? But although the feelings of respect and dislike were so completely obliterated that others of admiration and affection took their place, still Dillenius never adopted Linnæus' views, but remained constant to the system of Ray.

There is another version of this story current, that makes Linnæus appear in company with Sherard. According to this account, Sherard received him with affability, Dillenius with coldness, the latter remarking in English to Sherard, "This is the young fellow who is putting all botanists and all botany into confusion." Linnæus, for a time, took no notice of this unmannerly remark, the meaning of which he gathered from the way Dillenius pronounced the word "confusion;" but after he had explained away some difficulties respecting the "Linaria Cymbalaria," which neither Sherard nor Dillenius had been able to do, he revenged himself by saying quietly, he hoped he had not brought "confusion" into the Botanic Gardens at Oxford. Dillenius blushed, and apologised for his expression.

There is no reason for disbelieving the correctness of this story, only we must substitute the name of Dr. Shaw for that of Sherard, for Linnæus did not visit England till 1736, eight years after Sherard's death.

All this while Dillenius had been collecting material, and investigating the class Cryptogamia, making considerable excursions into

Wales and other parts of the country in search of new species, more especially of Mosses; and when the publication of his "Hortus Elthamensis" had furnished him with more leisure, he gave his whole attention to this particular branch of botany, and in the year 1741 he gave to the world that excellent digest of his labours, the "Historia Mnscoomm."

Six years after the publication of this work he was seized with a fit of apoplexy, which ended his life on April 2nd, 1747, at the comparatively early age of 60.

Dillenius was succeeded in the professorship by Dr. Humphrey Sibthorp, of Magdalen College, who continued in possession of the chair till the year 1784, when he made way for his illustrious son, Dr. John Sibthorp, of Lincoln College. This gentleman is well known for his labours in the European Flora. He made two excursions into the East of Europe, collecting and describing, and with the assistance of Ferdinand Bauer, the celebrated draughtsman, illustrating by the most beautiful drawings everything of interest in natural history; and before his death, which took place, alas! in the year 1796, when he was but 38 years old, he had prepared for publication those wonderful monuments of perseverance and learning, his "Flora Græca," and "Fanna Græca." Stricken down with consumption, induced by a cold caught when on his travels, he died after a short illness at Bath. After his death it was found that he had left in his will £300 a-year to defray, first the expenses of his "Flora Græca," and after its completion to found a Professorship in Rural Economy, and to furnish funds for making additions to the herbarium and library. The successor to Dr. Sibthorp was Dr. George Williams of Corpus Christi College. During his lifetime many preparations were made for the improvement of the gardens. The lower parts, which during rains, used to be flooded, were raised a considerable height, and this led the way for the changes that were effected by Dr. Daubeny, who succeeded to the chair on the death of Dr. Williams in 1834.

Dr. Charles Giles Bridel Daubeny was born at Stratton, in Gloucestershire, in 1735. From the school at Winchester, where he remained six years, he went, in his 20th year, to Magdalen College, where he obtained, first a "demyship," and afterwards a fellowship. After taking his degree, he sought to extend his experience by studying at other universities, and for this purpose went to London and Edinburgh, and afterwards at Geneva attended a course of De Candolle's lectures on botany, of which he took the most ample and elaborate notes.

One of his earliest works, and one of which his reputation as a great philosopher may fairly rest, was his "History of Volcanos." Into this work he compressed a wonderful amount of original information; and, notwithstanding the gigantic strides geology has made since then, it is one that may be read with the greatest profit at the present day.

In 1822 he was elected Professor of Chemistry, and in 1834 Professor of Botany. The first of these chairs he held till 1865, when he resigned it in favour of the present professor. Of the changes that Dr. Daubeny effected on his appointment it is difficult to speak too favourably. In the place of the old herbarium and library he built the present dwelling-house, while he removed the herbarium to a new and more commodious building on the north side of the gardens, away from the river. The garden itself, too, was entirely remodelled, the rabbits that infested its walks routed out, and the garden laid out partly on the natural system and partly on the Linnaean. The improvements that were made during both Professor Williams's time and Dr. Daubeny's were conducted entirely by Mr. Baxter, sen., and his son, Mr. William H. Baxter, who together have for the last 57 years devoted their whole time with the greatest ability to their accomplishment; and with what success they have laboured I am not permitted to speak, but I leave it for you discerning gentlemen to inspect the gardens, and judge for yourselves. The greater number of the present conservatories also are the result of Dr. Daubeny's indefatigable exertions. In all matters relating to horticulture or agriculture he took, as most of you will remember, the deepest interest. For the furtherance of both he purchased a piece of ground in the parish of Hilley, with the intention of carrying on experiments with different kinds of manures; and this ground he caused to be conveyed to the University, to be held in trust by them for the use of the Professor of Rural Economy. For some years, however, before his death his health was such as to prevent his undertaking any fresh experiments, so he let it, and when he died it had run into great disorder.

Dr. Daubeny was one of the earliest supporters of the British Association, and in 1856 he presided over its deliberations at Cheltenham; and so great was his popularity there, that a medal was struck in his honour to commemorate the occasion—a tribute of respect that has never been paid to any other president by his friends and admirers.

It would be beside my purpose in this paper to enlarge upon other matters than such as are purely botanical; but I cannot before concluding refrain from drawing your attention to the fact that Dr. Daubeny was one of the earliest and strongest supporters of scientific instruction being given in this University. With but few sympathisers on his side he did battle for a natural science school, at a time when its introduction was dreaded by the majority of his contemporaries. But he lived to see his early dreams realised, and before he died he had the satisfaction of beholding a young but flourishing school, with ample opportunities for teaching, and an efficient staff of professors

and tutors labouring in all its various branches. What he aided in establishing it is our part to maintain; and you, I am sure, will wish us "God speed."

ROYAL HORTICULTURAL SOCIETY.

AUGUST 17TH.

ALTHOUGH one of the minor Shows, this was advanced to the dignity of being held in the conservatory instead of the Council-room, as every one expected. It deserved the distinction. It was not a large show, it was not a remarkable show, but it was a good show, and a good show under adverse circumstances. Who is there not calling out owing to the drought? Very few, and fortunate they; and it was a marvel to see such stands of *Gladiolus* as were shown by Messrs. Kelway, Messrs. Downie, and Messrs. Buoyard among nurserymen; by Mr. Fry, Mr. Douglas, and the Rev. H. Dombraïn. Happy may they be in their well-earned honours, for even in the best of soils, in the best of situations, with the best of means, and with abundance of water, many could not have nearly approached the excellence in which these exhibited their favourite flowers. It was, too, an exhibition in all senses satisfactory; it was well arranged—*gay, gracefully arranged*, for along the centres of the tables were lordly Tree Ferns, *Campanulas*, and miscellaneous plants, which relieved the fatness stands of florists' flowers generally have. There were groups every so far giving diversity amidst the long lines of the regular tabling, bearing a variety of beautiful subjects. There were exhibitors well pleased (a rarity), and there were sight-seers well pleased too, but of the last there were not enough; for fine as the day was, fine as the show, London is now out of town. We have given great credit to the *Gladiolus* exhibitors; those of the Hollyhock equally deserve a word of praise, but we missed one well-known name, that of the Rev. E. Hawke, of Willingham Rectory—a name that will ever be connected with the Hollyhock, as the place will with Jeannie Deans. But there were many other things to interest—the *Phloxes*, neglected too much, but yet so beautiful *en masse*, or individually; the ornamental-leaved trees and shrubs from Messrs. Paul & Son, affording the means of diversifying the scenery of our pleasure grounds and parks; and, last, there was ample store of those novelties for which the advanced horticulturist is ever seeking, and that in many ways. The whole formed one of the best of the minor shows; it might have been better, but better it could hardly have been under the circumstances. The details we subjoin.

In Class I, for foreign growers, there was no exhibition, as might indeed be expected in the present disturbed state of the Continent. In the nurserymen's class for thirty-six Messrs. Kelway & Son, Langport, were first with magnificent spikes of *Molire*, Madame Vilmorin, *Spectabilis*, *Le Titien*, *Rosa Bonheur*, *Freemason*, *Madame Desportes*, *Robert Fortune*, *Agnes Mary*, *James Veitch*, *Elizabeth*, *Meyerbeer*, *Duc de Montebello*, *Prince Imperial*, *De Humboldt*, *Schiller*, *Newton*, *Lacépède*, *Legouvé*, *Velleda*, *Engue*, *Scribe*, *Formosa*, *Rossini*, *Stella*, *Norma*, *Virgile*, *Mathilde de Landevoisin*, *Leonora*, *Orphée*, *Monsieur A. Brongniart*, *Sultane*, *Van Dyck*, *Canova*, *Auna*, *Noémie*, and *Homère*. The spikes in this stand were all fastened to brass rails running longitudinally, which made them stand well up, and, being placed about 9 inches apart, the effect of the collection was much better than where the spikes were more crowded. No second prize was awarded, and the third prize went to Mr. D. Robertson, Heleusburgh, Dumbarton. The spikes in this collection were much inferior to those in the first prize one and to those in a collection from Messrs. Bunyard, of Ashford and Maidstone, which would have been second had it not been too late for competition.

Class 3 was for eighteen spikes. In this Messrs. Downie, Laird, and Laing, of Stanstead Park Nursery, were first with splendid spikes, though not on the whole equal to those shown by Messrs. Kelway in the preceding class. The varieties were *Madame Lesclé*, *Hortense*, *Le Ponsin*, *Canova*, *Orphée*, *Madame Bieder*, *Fulton*, *Lacépède*, *Sultan*, *Norma*, *Horace*, *Milton*, *Alexandra*, *Crystal Palace*, *Diomedé*, *Meyerbeer*, and *Shakspeare*. The second prize went to Messrs. Draycott & Sons, Humberstone Nursery, Leicester, who had excellent spikes of *Shakspeare*, *Imperatrice Eugénie*, *James Veitch*, *Madame Furtado*, *Sir William Hooker*, and some others. Messrs. Paul & Son were third; but Messrs. Stuart & Mein, Kelso, who sent noble spikes of *Princess Mary of Cambridge*, *Rossini*, *Armide*, *Monsieur Legouvé*, and *Maria Stuart*, and very good ones of several others, if not too late for competition would have taken a high position.

In the amateurs' class for twelve, Mr. R. Fry, gardener to V. Stuckey, Esq., Tannton, had an excellent stand in which *Shakspeare*, *Madame Vilmorin*, *Legouvé*, *Charles Turner*, *Norma*, and *Mathilde de Landevoisin* were the most prominent. For this and a stand from the Rev. H. H. Dombraïn, Westwell Vicarage, Ashford, equal first prizes were given. The latter had fine spikes of *Leonora*, *Madame Dombraïn*, *Madame Furtado*, *Orphée*, *Eleanor Norman*, *Rosa Bonheur*, *Mario Stuart*, *Homère*, *James Veitch*, and *Roi Leopold*. Mr. J. Douglas, gardener to F. Whitbourn, Esq., Loxford Hall, was second with *Delicatissima*, well named, being flushed with delicate pinkish lilac; *Orphée*, *Princess of Wales*, and good spikes of several other kinds.

For nine spikes, Mr. R. Fry was again first with excellent spikes, Mr. Douglas being second, and the Rev. H. H. Dombraïn third; and of six spikes, Mr. Welch, gardener to J. Marshall, Esq., Belmont Park, Tannton, was the only exhibitor, and took a first prize. For four, Mr. Fry was first with very fine spikes of *Lacépède*, *Robert Fortune*,

Anna, and De Humboldt; the Rev. H. H. Dombrain being second; his varieties were Rosa Bonheur, Agathe, Madame Desportes, and Elizabeth, all being good.

Hollyhocks, though not numerous shown, were very good, especially for such a dry season. For six ent spikes Mr. W. Chater, of Saffron Walden, was first with fine spikes with very perfect flowers, the varieties being Fascination, Conquest, Eclipse, salmon rose, very large and fine; Cygnet, white; Scarlet Gem, and Frederick Chater, ruby. Messrs. Downie, Laird, & Laing were second with Mrs. Downie, Alexander Henderson, Lady W. W. Wyne, Queen of Yellows, Miss Henderson, a lovely flower, and John McDonald. The third prize went to Mr. Minchin, The Nurseries, Hook Norton, who had Frederick Chater very fine, and good spikes of several others.

The best twenty-four cut blooms came from Mr. W. Chater, and were well worthy of his reputation, being very perfect:—Fanny Chater, beautiful rose; Conquest; King, cream colour, tipped with lilac rose. Midnight, Scarlet Gem, Champion, Bullion, Walden Primrose, Talisman, Alfred Chater, Jewel Conquest (ruby), Leviathan, Leah, Alfred Chater, Mochanna, Crimson King were very fine. The tipped kinds are quite ladies' flowers. Mr. Minchin was second, and Messrs. Draycott third, each with excellent blooms. The only exhibitor of twelve blooms was Mr. Minchin, who had a first prize.

Phloxes looked rather rough as cut blooms; we would prefer to see them shown on the plants, which would also give a better idea of the habit. Messrs. Downie, Laird, & Laing were first with La Duchesse de Bauffremont, Triomphe du Parc de Neuilly, very fine and free-flowering; La Candeur, Monsieur William Bull, Monsieur Charles Turner, Monsieur Hugh Low, lovely colour; Madame Domage, Joseph Heim, Magnificent, and Gloire de Neuilly, the latter very brilliant. Messrs. E. G. Henderson were second; Souvenir de Berryer, Louis Warrich, Diomede, and Hermine de Turenne were very attractive. The third prize went to Messrs. Paul & Son, who had also some very fine varieties. To those who know how ornamental this flower is, it is somewhat surprising it is not more extensively cultivated.

Of miscellaneous groups, one from Messrs. Arthur Henderson and Co., of the Pine Apple Place Nurseries, contained numerous small specimens of Palms, such as *Malortia speciosa*, *Calamus accidens*, a graceful species; *Euterpe sylvestris*, *Livistonia rotundifolia*, *Hypophorbe Verschaffeltii*; *Ferns*; the pretty, free-flowering, and very useful *Begonia weltoniensis*; and *Draenas*. In a group from the Society's gardens accompanying that of Messrs. A. Henderson was *Trachelium caruleum*, an old but very ornamental plant, nearly hardy, and producing a profusion of heads of bluish lavender flowers. The same plant is freely introduced in the baskets in the conservatory and with excellent effect. Mr. B. S. Williams, of Holloway, had a very effective group, in which was a remarkably fine specimen of *Allamanda Hendersonii*; *Cochlostema Jacobianum* with two heads of its beautiful flowers; *Mitonia Morelliana atrovirens*, a very fine variety; numerous *Acrides*; *Dendrobium triadenum*, with a head of small white flowers tinged with lilac, and having a small rich yellow blotch at the base of the lip; *Cypripedium Stonei*; new *Draenas*; *Yucca filamentosa variegata*, very fine; *Billbergias*; *Antherium Scherzerianum*, with fourteen spathes, most of them expanded; several fine *Pithech Plants*; *Ferns*, and a handsome specimen of *Phœnicophorium seehellarii*, and *Nerine eouscans major*, an old but showy plant now but seldom seen.

Messrs. F. & A. Smith sent a fine collection of Balsams, and several plants of the showy *Rochea falcata*. Mr. Bull, of Chelsea, also contributed an interesting group, in which were a double Tiger Lily, the extremely handsome *Encephalartos* shown by him lately, several Palms, *Draenas*, Orchids, the singular *Godwinia gigas*, fully noticed some time ago in our pages, and some other plants.

Messrs. Paul & Son, of Chesham, sent a small collection of pot Roses, stands of cut blooms, and an extensive and interesting collection of cut specimens of hardy trees and shrubs, with ornamental foliage. Messrs. Draycott, Humberstone Nurseries, and Mr. Walker, nurseryman, Thame, sent good collections of double Zinnias, and Mr. Walker sent a very good stand of Dahlias.

FRUIT COMMITTEE.—George F. Wilson, Esq., F.R.S., in the chair. Mr. Stew, of Farnborough, near Bromley, sent specimens of a seedling Black Currant, which was exhibited at last meeting, and also specimens of Black Naples, to show that the seedling was not the same variety; but the Black Naples shown were very inferior examples of that variety, and the Committee confirmed the previous opinion. Mr. Dry, of Hayes, Middlesex, sent a seedling Plum, called Duke of Edinburgh, a handsome purple Plum, with a thick blue bloom. It is a freestone, with yellow flesh, and judging from the branch which was sent, it appears to be very prolific. It was awarded a first-class certificate. Mr. Porter, gardener to E. Benham, Esq., Sten Lodge, Isleworth, sent a dish of Prince of Wales Plum. Mr. Porter also exhibited a dish of Hawthornden, and another variety unnamed. Mr. Tillery, of Welbeck, sent a dish of Barrington Peaches, large and handsome, and of delicious flavour, to which a special certificate was awarded.

Of Apricots, Moorpark, from Mr. Tillery, gardener to the Duke of Portland, Welbeck, was first; Mr. Gardiner, Lower Ealington Park, Stratford-on-Avon, being second, and Mr. Smith, gardener to the Earl of Gainsborough, Hexton Park, third.

Mr. Pearson, of Chilwell, sent a bunch of a seedling Grape, called Chilwell White, which, as Mr. Pearson observed, he intended as a white companion to the Black Hamburgh. It produces a fine berry, with a short, stout, warted berry stalk; the skin membranous, though not thick, and the flavour of the flesh like that of Black Hamburgh. This was awarded a first-class certificate. Mr. Pearson also exhibited a bunch of Ferdinand Lesseps, raised by crossing Royal Muscadine with the Strawberry Grape, in which the flavour of the latter is distinctly traceable. The bunches are nearly as large as those of Royal Muscadine, and the berries quite as large, of a fine deep amber colour, and the flavour particularly rich, with a fine perfume. It was awarded a first-class certificate. Mr. Record, of Lillesden, sent a dish of very large and handsome Morello Cherries, which received a special certificate. Messrs. Rolleston, of Tooting, sent a collection of fifteen different sorts of Crabs.

Messrs. Carter & Co. sent pans of a new salad called Chinese Mustard, which is a distinct sort from the ordinary Mustard. The seed is black and as large as that of the White Mustard, and quite different from the common Black Mustard. The flavour of the salad is more pungent than common Mustard, and by some thought to be more agreeable. Seed was sent to Chiswick to be grown, and the salad to be exhibited at next meeting. Mr. Tillery, of Welbeck, sent specimens of the White Turkey Cucumber. Mr. Record, of Lillesden, sent dishes of Giant King Potato, a large second early and very prolific. Messrs. Carter and Co. again exhibited large specimens of the Italian White Tripoli Onion. A collection of vegetables was sent by Mr. G. Bloomfield, gardener to W. Williams, Esq., Parkside, Wimbledon. Messrs. Harrison & Son, of Leicester, sent a brace of Black Spine Cucumbers.

Mr. Ward, gardener to T. N. Miller, Esq., Bishop Stortford, sent four magnificent Charlotte Rothschild Pines, weighing 38 lbs. collectively. They received a special certificate.

FLORAL COMMITTEE.—Rev. Joshua Dix in the chair. Messrs. Cripps, nurserymen, of Taunbridge Wells, received a first-class certificate for *Clematis Victoria*, a remarkably fine purplish variety; and a similar award was made to Messrs. Baker & Son, Bagshot, for *Clematis Gem*, small, but distinct in colour, a bluish lavender. Messrs. Cripps also sent a variety of *Catalpa siringifolia* with golden leaves, which, it was stated, had been exposed to the sun, and became improved in colour, while in the shade it reverted to the normal green. From G. F. Wilson, Esq., came *Lilium longiflorum albe-marginatum*, quite white, which received a first-class certificate; his handsome namesake, *Lilium Wilsoni*; the still more beautiful true *Lilium speciosum* being also shown by the same gentleman, an ardent lover of the Lilies, and one who can grow them well. It is a marvel to us that such flowers, with such a poetry, with such fragrance, such loveliness, are not more cultivated now.

Mr. Porter, gardener to E. Benham, Esq., Isleworth, had a second-class certificate for Hollyhock Rose Queen. Mr. Bull, of Chelsea, received a first-class certificate for *Lilium tigrinum splendens*, a remarkably fine variety; also for *Cureuligo recurvata variegata*, broadly striped with white, a very fine variegated plant. The same exhibitor also sent *Geonoma Verschaffeltii*, *Lomaria auriculata*, and other interesting plants.

From Messrs. E. G. Henderson & Sons, Wellington Nurseries, St. John's Wood, came *Pteris serrulata gleicheniifolia*, a beautiful, small-leaved Fern, which received a first-class certificate.

Mr. Wheeler, Bath, was awarded a first-class certificate for *Dahlia Marchioness of Bath*, white, tipped with purplish rose, and of fine form. Mr. Williams, of Holloway, received a first-class certificate for *Ladia*, or *Cattleya*, *elegans gigantea*, a very fine variety. He also exhibited *Ixora Williamsii*, a plant which promises to be very fine for exhibition purposes, and *Maranta Barquinii*.

Mr. Cannell, of Woolwich, had a first-class certificate for double *Pelargonium Crown Prince*, of the same colour as *Marie Lemoine*, and apparently not so good.

Mr. Perry, Castle Bromwich, sent a stand of his fine seedling *Verbenas*, of which Mrs. Boulton, with large pips, white, with a purplish crimson eye, was awarded a first-class certificate. Mr. Eckford, gardener to the Earl of Radnor, Coleshill, had first-class certificates for *Verbenas Grand Monarch* and *George Peabody*, the first a fine scarlet, the second plum with a white eye. Mr. George, gardener to Miss Nicholson, Putney Heath, had a special certificate for a collection of cut Zonal *Pelargoniums*. Mr. Williams, Crystal Palace, Sydenham, sent a fine golden variety of *Lilium auratum*; Messrs. Carter & Co., fine cut blooms of *Marigolds*, French and African, a double-headed *Love-lies-Bleeding*, and a white *Lupine*. Mr. Minchin, Hook Norton, sent some fine *Hollyhocks*, which were not, however, considered an advance on existing varieties; Mr. Walker, Thame, seedling *Dahlia*; Mr. W. G. Smith, *Boletus calophas*, *B. edulis*, *B. subtomentosus*, and *Lactarius oxuccus*, which, however fine the specimens, were by no means appetising. From the Society's gardens came cut branches of a *Gleditsia*, which, we believe, furnishes some of the much-vaunted cattle foods.

GENERAL MEETING.—W. Marshall, Esq., in the chair. The Rev. M. J. Berkeley in addressing the meeting called special attention to Mr. Williams's *Cattleya* already noticed, to the beautiful *Dendrobium triadenum* shown also by the same exhibitor, and to *Rodriguezia snaveolens*, which, he said, was the same as *Gomesa recurva* of Loddiges'

"Botanical Cabinet." the true plant being figured in the "Botanical Magazine" under the name of *Pleurothallis snavcolens*. The variegated *Carex recurva* from Mr. Bull was a plant well worthy of notice. With regard to *Lilium Wilsoni*, it had at one time been supposed to be the same as *Lilium Thunbergianum*, but the two had been found to be perfectly distinct. The golden *Catalpa syringifolia* had been awarded a first-class certificate. Many other plants had exhibited a similar character this year, and this might be rendered permanent by grafting. The Dodder on the Clover was next referred to in connection with a curious parasite on a Heath, and one of the species of *Cuscuta*, it was stated, attacked the Vine. With regard to the Onions shown, he had been informed that what had been supposed to be the early variety of the Tripoli was that of which the seed had been procured from Naples, whilst the later variety was raised from seed ripened in colder parts. Mr. Berkeley then referred to some abnormal specimens of Gourds he had lately had submitted to him, which were covered with warts, which had the rudiments of leaves, but in which he could discover no rudiments of flowers; and in those varieties of Gourds called Bush Squashes he had noticed this season a tendency to develop an infinity of blossoms without fruit.

NEGLECTED PLANTS.

CANARINA CAMPANULATA.—This fine old greenhouse herbaceous perennial, which was introduced as far back as 1696, is now very rarely met with indeed. Last spring I saw a large specimen of it, covered with its numerous orange-coloured, bell-shaped flowers, and growing in a small conservatory, apparently receiving no extra care, and yet doing as well as the most ardent cultivator could desire to see it. As it blooms early in the winter and spring, it dies down in May, and the plant is then put out of doors in some shady place to rest. In August young growth appears breaking-up from the root, like that which comes from a Dahlia, and the young shoots, if taken off, can be struck in a similar manner to the cuttings of the Dahlia. As it will not stand the slightest frost, it must be removed to a greenhouse ere frost sets in; and here the plant will make its growth, and flower before Christmas. Like the Dahlia, it will do with generous treatment: a good fibry loam, enriched with some manure, and helped with some sand, would suit it well. It is one of those neglected plants that richly deserve a much more extended cultivation, and the example referred to above I saw at Redbridge, near Southampton, the residence of Mr. William Stride. The fine condition of the plant was highly creditable to the gardener, Mr. Davis.

ZEPHYRANTHES ROSEA.—It seems scarcely possible to believe that this beautiful half-hardy bulb should have to be classed with the neglected plants, but so rarely is it now seen that the conclusion is inevitable. It cannot be because it is difficult to cultivate, for Mr. Baines, gardener to H. L. Micholls, Esq., formerly of Manchester, at whose new residence—Southgate Park, near London—I recently saw it in bloom, says it is difficult to kill it; and, as it was here developed, I can conceive nothing more suitable for conservatory decoration at this season of the year. It remains in bloom quite two months; and when in bloom, it should be kept shaded to prolong the duration of the flowers; previously to that, it should have plenty of light and air. The ordinary treatment of the hardy kinds of *Amaryllidaceae* plants would appear to suit it well.

ANOMATHECA CRUENTA.—This is another somewhat neglected plant, though more frequently met with than either of the preceding. I also saw this at Southgate Park, growing in the same pot with the *Zephyranthes*, as well as in the pots of other *Amaryllids*. Mr. Baines stated he encouraged it to grow in this fashion as much as possible, by sowing the seed, and sprinkling it over the surface of the pots. The seed grows readily, and in this somewhat irregular way a good many pretty dull crimson flowers are thus secured to cut from. It is also capable of being cultivated out of doors, and will bloom in borders, or planted in some soil made up of sandy peat. It is a bulbous-rooted plant, with an *Ixia*-like appearance of growth, and it can be increased by offsets as well as by seed.—R. D.—*(The Gardener.)*

WEEDS.

EVERY weed allowed to arrive at maturity with any crop is a diminution of the yield; it impoverishes the soil as much as a cultivated plant. Wheat, Barley, and Oats do not exhaust the soil more than Couch, Bent, or Rib-grass. Land in which these are plentiful will produce good crops of one or other of the former. The same holds good of the more succulent weeds, as Groundsel, Chickweed, and Charlock. Docks, Thistles, and

Dandelions take quite as much nutriment from the soil as Mangold Wurtzel, Turnips, and other root crops. It is an acknowledged fact that land rank with natural vegetation is capable of the highest cultivation; it will produce in perfection some one of the many plants necessary for the comfort of man. Land by nature sterile forms but a very insignificant portion of the earth's surface; except, perhaps, the sands in the interior of Africa and other quarters of the globe, there is but little of its surface not teeming with vegetable life, on which man directly and indirectly is dependent for his sustenance. He must, therefore, look well to the proper cultivation of the ground. He must select, not only the plants most suitable to the soil, but those which will afford him the greatest return. All soils have constituents suited to the growth of plants of more or less value to man. The natural vegetation may be Couch, Bent, and other coarse Grasses, but, as already stated, such ground will grow most, if not all, of the cereals. By breaking up the natural vegetation, and freeing the ground of that which is of little worth, it is made suitable for the growth of plants of considerably greater value.

Uncultivated soils are in course of time enriched by the plants growing on them decaying year by year, increasing the depth of the soil and adding to its fertility. Uncultivated plants return to the soil quite as much, if not more, than is taken from it, but cultivated plants impoverish the soil, because their produce, for instance in grain and straw, is taken away, and there is no annual deposit of vegetable matter except by weeds. Every crop is exhausting, and the soil soon becomes worn out, for no one crop can for any long period be profitably grown on the same soil. Hence the desirability of a change of soil—a rotation of crops. We must not only afford a change of soil, but we must return to the soil what the crop takes from it. This is effected by manuring.

Whilst vegetable matter, which we have in the decayed natural vegetation, is necessary for the fertility of the soil, the removal of such matter does not cause sterility if due regard be paid to the application of manures. Weeds, then, are of no value in cultivated soil; they appropriate that which ought to go to nourish the crop, and diminish production without returning an adequate equivalent. The great advance made in the art of culture is one of the boasts of our generation. Various implements for breaking up the soil, giving increased depth of soil, exposing it to the influence of the atmosphere, and producing a better tilth for the reception of the seed, have done much in enabling us to obtain better crops; they have also assisted in freeing the ground of weeds. Sowing in drills has likewise afforded greater facilities for the cutting-up of weeds; and, as regards root crops, this is so well carried out that many fields would compare advantageously with some gardens. Fields of Wheat, however, may be seen red with Poppies, and Oats and Barley a mass of yellow from the quantity of Charlock, to say nothing of the Thistles, Docks, and Plantains; at a prominent in every meadow and pasture; and what of the Groundsel, Chickweed, and other annual or biennial weeds which undisturbed attain maturity with every cereal crop? The weeds, along with a portion of their seeds, must be harvested with the crop, and some must remain among the grain however well it may be cleaned, and a still greater portion will find its way with the straw to the manure heap, and ultimately to the soil again. In this way weeds are propagated.—G. ABBEY.

(To be continued.)

FLORAL ICE HOUSES IN NEW YORK.

THE present has been one of the most trying seasons known in this latitude for a great number of years, the thermometer having frequently risen above 100° in the shade, and seldom fallen below 85° day or night for the last four weeks (I write on July 27th), and being frequently up to 92° by eight o'clock in the morning. Think of that, ye floral devotees. How long would your pets exist in such a temperature? A bud in the morning is a full-blown flower by midday, and rapidly forming a seed vessel by night. This unusually heated term has caused a great amount of loss to those who deal extensively in cut flowers in this city, from the rapid depreciation in value of their stock in trade; but one, at least, of our spirited business men has been equal to the occasion. Mr. Walter Reid, one of our most enterprising city florists, has had a miniature ice house constructed in the rear of his store, and so arranged that he can raise or lower the temperature at will. There he can keep Rose buds, Tuberoses, Gardenias, &c., fresh for a week if

necessary, instead of becoming stale and unsaleable a few hours after getting them on hand. Mr. Reid is the son of Mr. Robert Reid, lately a florist in this city, and for many years a judge at Chiswick in its palmyest days, and he has now his father's

certificate of membership of the Royal Horticultural Society, framed and hung up in his store, with the Duke of Devonshire's signature and the Society's seal attached—perhaps the only thing of the sort in America.—DAVID FOULIS, *New York.*

DESIGN FOR A FOUNTAIN.

The design represented in the accompanying engraving is entirely of iron, the centre-piece and spouts throwing out a

beautiful series of water jets. The fountain is a beautiful specimen of ornamental ironwork for lawn and garden pur-

poses. The use of architectural and iron ornamental work in and around our suburban villa grounds is becoming more and more extensive, and in truth is necessary to help out to the full the pleasure and tasteful enjoyment of rural life.—(*Horticulturist*)

BEDDING PLANTS IN 1870.

As this has been an exceptional season for bedding plants, I send a few notes, which may be of interest to some of your readers.

I have always been an advocate for early planting, combined

with early preparation, of bedding plants, and this year has more than ever confirmed my views on this subject, for, with hardly any exception, in every garden which has come under my notice this year, those plants which were backward or put out late have done no good, while those which were put out early as good established plants have stood the dry weather and done admirably. And in this view I am confirmed in a letter from A. O. Walker, Esq., of Chester, who says that he has never seen bedding plants finer where they were planted out early, and that those planted late have done no good whatever.

This year I was living in Gloucestershire at bedding-out time, and I had all the beds planted and the garden finished by the 26th of May; and though from that time through the whole of June there was only one shower of rain, I never allowed any of the Geranium beds to be watered; the only beds which had any water were Verbenas and Calceolarias. We left there late in June, and I have been twice there since, and although the lawn was burnt up as brown as a high road, and the leaves were falling from the Elm trees as if it had been October, the last time I was there, about the 3rd of August, the Geranium beds were still good, especially Waltham Seedling and Indian Yellow; the only useless one, which I have long given up here, being *Christino*. Lord Palmerston was splendid in the middle of July, but had over-flowered, and the exceeding heat and drought, in Gloucestershire, of the last week in July were beginning to tell upon it.

Here, in Yorkshire, we began to bed out about the 16th of May, and planted everything but Coleus and Indian Maize by the end of the month; these were put in the first week in June. The Indian Maize, grown from a cob of English-ripened seed sent me by Dr. Hogg, has done very well.

It has been too hot and dry for the Coleus, which was planted under the front wall of the house, but the plants are growing well still, and I expect will get a good colour when the sun has less power; but as the thermometer laid on the grass in the sun has frequently registered over 120°—this very day, August 12th, being over 120° for two or three hours consecutively—it seems to burn the colour out of the leaves, and to give them a rusty hue. It is almost impossible in a stove to give them too much light, but there the moist atmosphere prevents the sun blanching them.

Beet has done well with me where the sparrows will leave it alone; but they have proved a great enemy to it this dry summer when they are short of insects, and they get under the shade of the leaves and peck the juicy stems to pieces, hardly ever touching the leaves themselves, but destroying the stems completely. In a wet season the plants would have grown away from them, but this dry season they have done the plants in places a great deal of injury.

Iresine Lindenii will, I think, be a valuable acquisition in a less trying season. It has stood the dry weather pretty fairly; but as we have now had only 0.33, or the third of an inch of rain, since the 30th of June, and the last few days have been hotter and drier, if possible, than ever, ranging from 75° to 86° in the shade, with a north-easterly wind, they are beginning to succumb, and as I can only afford water for Verbena beds, I am afraid if rain do not come very soon that they will hardly recover. Even Indian Corn is beginning to flag now, and *Perilla* is suffering worse than *Iresine*.

My Verbenas, especially mixed Verbenas, have been splendid this year, but I have watered them regularly—not mere surface watering, but copiously, and the plants cover the surface of the beds so entirely that there is comparatively very little evaporation now. There were some very good sorts among the new ones of last year, especially *Monarch*, *Emma Perry*, *Sunny Thoughts*, *Peacemaker*, *Out-and-Out*, *Mrs. R. Hole*, &c. I do not, in fact, ever remember a much better lot of seedlings being sent out by Mr. Perry. Of older sorts, *James Birbeck* and *Miss Wimssett* have been remarkably good, and a chance seedling, a cross between *Crimson King* and *Foxhunter*, which I bedded on trial, has proved an effective bedder.

Calceolarias have not done well with me; I have used this year more *Tagetes signata pumila* than *Calceolaria*, but intend another year to go back to the *Calceolaria* again. Two beds of *Tagetes* have been very good, but a row of *Tagetes* was too near some *Arabis variegata*, which was a harbour for slugs, and several plants were destroyed, and the blanks had to be filled up from reserves, so that the rows were uneven. *Tagetes* also comes in too late to please me, so that I shall plant more *Calceolarias* another year, though I think the colour is rather too gaudy and striking to use much of, especially in masses, as there is

no relief to the eye in a large bed of yellow *Calceolarias* if in full bloom. As a row in a ribbon border it is more appropriate, and certainly there is no yellow to equal it in point of richness of colour. All yellow-foliated plants are really only yellow greens, but as such are very useful, notably *Pyrethrum Golden Feather*, which is certainly one of our most valuable additions to the garden, its only drawback being its tendency to flower, which can, however, be kept under by judicious cutting, and seedlings are much less troublesome than cuttings, especially if the centre be well cut back at the first appearance of a flower bud.

Lobelia Little Gem has been beautiful with me this year. Those who do not possess it should certainly give it a trial. The colour is much the same as that of *Paxtoni*, but it is much more dwarf, and has the invaluable habit of making plenty of leaf and growth before flowering, so that when turned out in spring it forms, under proper treatment, masses of dense foliage. I pricked out mine in the middle of March under light frames, such as I have previously described in the pages of your Journal, and transplanted them with balls, and I have not seen a single failure in those planted early; but some which were planted out later to take the place of some seedling *Lobelia speciosa* which had not done well, died after flowering. Those which were planted early are still blooming profusely, and likely to continue some time longer, though they have been in full bloom now for more than eight weeks, and most of the plants were blooming when put out in May.

Another plant for edgings which always does well with me, and is not, I think, sufficiently used, is the large-leaved variegated *Periwinkle* (*Vinca*). Its leaves are always bright, and it stands both wet and drought; it has a straggling habit, but is easily pegged down and kept in, and it can be pegged by means of its own shoots. If one of the long trailing stems be buried on one side, then drawn over the plant, and buried again on the other, both of the ends will root, and the plant may thus be made to keep itself trained.

I will defer my remarks on Geraniums till another time, as it would make these present notes too long. I will only add about them at present, that with me the *Nosegays* have again been much the best, William Underwood having been the only good Zonal which can at all compare with such sorts as *Violet Hill*, *Bayard*, *Waltham Seedling*, *Indian Yellow*, *Duchess of Sutherland*, &c. *Violet Hill* seems still the very best I have seen, and in this opinion I am confirmed by every gardener who has seen it here this year. It is nearly as good now, when other Geraniums are suffering from the dry weather, as ever, and the beds have never had a drop of water given to them since they were planted; and I am more and more convinced, that the best way to treat Geraniums is to get sorts that will bear manure and rich treatment without growing coarse; then, if dry weather come, they have the manure to support them, and if wet weather, from their dwarfer growth and freer habit of blooming they will not go to leaf, even under good treatment, so much as the older sorts of strong-growing Zonals, as *Clipper*, *Dr. Lindley*, *Lord Derby*, *Herald of Spring*, &c., and in dry seasons they do not run to seed or shed their petals as the Zonals do. I forgot to say that in Gloucestershire *Iresine Herbstii* has stood the dry weather admirably, and grown vigorously, though the colour is not so rich as in damp, warm weather.—C. P. PEACH, *Appleton-le-Street*.

AFTER experiencing a wet and somewhat sunless spring and fore-summer in this part of the country, we are now undergoing a roasting process much more severe than that to which we were subjected last season, and it may be interesting as well as useful to note how different bedding plants are enduring it.

To begin at the beginning, for they are undoubtedly the alpha of the bedding alphabet, *Pelargoniums* are mostly doing well. The principal exceptions are *Golden Fleece*, *Cloth of Gold*, and some of the new bronze sorts. The first two were beautiful so long as the dripping weather lasted, but now many of their leaves are turning up round the edges and crumbling away into dry dust. Why they should do so when others of the white sorts with just as little green in their leaves, such as *Castlemilk* for example, stand uninjured, will most likely remain one of the many unanswered whys which are continually meeting us. Perhaps it may be that the leaves of the latter, being white, reflect the sun's rays, while the yellow leaves, being able to do so only in an inferior degree, are sunstruck and shrivel up; or perhaps it may be from a totally different cause; but one thing is certain, that those two of the golden names cannot be trusted to behave themselves when planted where they are fully exposed

to the sun. Some of the larger leaves of Mrs. Pollock are also similarly affected, but otherwise this oldest and best of bedding Tricolors is at present wearing her brightest colours. That pretty, variegated, Ivy-leaved Geranium L'Élegante seems to find its way but slowly over the country, yet it is really one of the most delicate and quietly artistic plants I know either for edgings or for carpeting under tall-growing plants, and it is never more beautiful than during weather such as this.

Calceolarias are giving much trouble in watering and stuffing short grass among them, but in return they are blooming most profusely, and promising well for the rest of the season, except *Aurea floribunda*, whose beauty threatens soon to be a thing of the past. This fine Calceolaria will not succeed in dry light soils without more work being expended upon it than even it is worth. In the beginning of May, while they were growing in Celery trenches, the Calceolarias suffered rather severely from what was to me a rather novel cause, the tops of many of them being destroyed by a curious shield-shaped insect called *Pentatoma baccharum*, which lives on the sap of plants, piercing the soft tissues for the purpose of extracting it, and literally sucking them to death. I have long known them as preying upon the tops of Potatoes, Beans, &c., though not previously upon Calceolarias, but they have never appeared in such numbers here as they did last spring.

Many of our new, and, in point of flower, best Verbenas seem utterly incapable of enduring any great hardship. It would appear that the improving process has well-nigh ruined their constitutions; but this is, all the world over, one of the ills incidental to a highly artificial state. Even we, in ceasing to be savages, have had to make considerable sacrifices. Many of them, while refusing point-blank to grow upon a dry-dust regimen, likewise take offence at the daily waterings necessary to keep them moist, let the water be never so scientifically applied, and make little more progress than if it were one of the coldest of seasons. Fortunately they are not all alike, and there are plenty to choose from, and for decorative purposes very few gardeners really require more than four or five sorts, including *Verbena venosa*, which ought to be everywhere.

Viola cornuta that was planted in April is still passable, but old edgings of last year's planting are done. *V. lutea* does not succeed here. The yellow and blue bedding Pansies have also begun to look seedy.

The much-vanished Golden Feather *Pyrethrum* is most un-sightly wherever I have seen it during the last three weeks. There can be no doubt as to its proper place being the spring garden, where there are no Calceolarias to outshine it, but long before the dog-days it ought to be on the rubbish heap. The variegated *Polemonium* is doing well, with liberal waterings, and is, as everybody knows, a most beautiful edging plant, but how does it happen that though it is universally known as *P. cereuleum variegatum*, yet the flowers are invariably white, at least all those that I have seen?

Petunias, *Gazanias*, and *Gaillardias* are doing well. *Gaillardia coccinea* is quite an effective bedding plant when grown from cuttings, from seed it is rather late in beginning to bloom. —AVESHIRE GARDENER.

METROPOLITAN SOCIETY'S EXHIBITION AT THE CRYSTAL PALACE.

MAY I use this channel of communication to answer a good many letters that I have received on the subject of the exhibition to be held on the 6th, 7th, and 8th of September? And first of all to thank the very many kind friends (for friends they are, although many of them unknown to me), whose letters strew my table, for the kind and cheery words of encouragement that they give me, and for the offers of assistance ungrudgingly made. It is, I can safely say, a matter to me of deep gratitude that not only these have been given, but that I have been so implicitly trusted in all the arrangements for the show. To be told by one that "the Society is the very thing that is wanted, and that it is sure to be popular;" by another, one of our most distinguished florists, "I have been asked to go to Ireland, but have declined, as I want to stay and help you;" by another, one of our most ardent amateurs, that "I am quite willing to give you any assistance in my power," is indeed cheering, and these are but samples of many that I have received.

"What are our prospects of a good show?" Well, far better than I could have anticipated. We commence operations in probably the most trying season for florists' flowers the present

generation has known, and yet withal, from the entries already received, I feel convinced we shall have a good exhibition. The time has now come when the florists can testify whether they are able to hold their own, and I sincerely trust they will give one and all a hearty pull in this matter. I can promise them, as far as I am concerned, there shall be nothing but fair and open dealing, and that we know no party. We bury the hatchet of all past differences, and welcome all who desire to encourage florists' flowers.—D., Deal.

"REDCARRE, A POOR FYSHER TOWNE."—No. 3.

SAUNTERING southward along the unexcelled sands for a short three miles, the four bathing machines of the village of Marske are reached, and on a lofty cliff-point above stands forth the goodly mansion of Joseph Pease, Esq. It seems bare, and needing plantations of sea-defying trees to nestle among; and high and exposed though it is to all the gales from every point of the east, I think some of the trees enumerated not long since in your columns as successful settlers on our sea-shores would maintain their good character here, and they deserve the trial, and the mansion deserves their success. When the cliff is climbed, and a peep obtained over the garden wall, there is evidence—special evidence—of provision made for shelter against the rough cold winds which sweep over the cliff. A deep sheltering valley is cut, with turfed sloping banks on either side, and at the bottom of the valley are flower borders with a broad gravelled walk between.

I am a wanderer just now, and my thoughts, like my steps, are vagrant, and you will so think when you read my next jotting—the name of Pease led to the query, Is that the correct plural of Pea? I think it is not. A correspondent in *Notes and Queries* recently remonstrated against such a plural form, and truly observed that if admitted, then the plural of sea might be "sease." I think that "Pease" was formerly the singular. At all events, Phillips in his "World of Words," published in 1678, so used it. He says, "*Pease* (Pisum), a sort of pulse of a most pleasing savor, and at the first coming accounted a great rarity. That sort called *Pease Everlasting* hath a very fine flower or blossom, and is called in Latin *Lathyrus*; the *Wood* or *Heath Pease*, *Astragalus*." "Pease" might have been used both as a singular and plural noun, just as we use fish and sheep; but I remember that "Peason" was one plural form, but being away from my books I cannot detail the when and where it was so.

"Here is the smugglers' grave," said an old man in the graveyard which crowns the cliff opposite to Mr. Pease's house. "They was drown'd by their boat's upsetting, but the scription's clean gone." "Not quite," I observed, "here are the commencements of five lines—H—, Franci—, Ka—, W—, K—. Then the sculptured figures on this headstone are of a man carrying a woman on his back, and a girl by another man's side. The boat upset is plain enough, but I interpret that the four drowned were Francis some one and Katherine his wife, and William some one and Katherine his daughter." My old guide "never knew the like," and so we parted; but as I made a circuit, facing me was a monument to the memory of the Earl of Zetland's gardener, Henry Yarker, and Hester his wife. Strange is it that, go where I will, something about horticulture is sure to confront me. My next move was on to Saltburn, and the first book handed to me by a bookseller in answer to my inquiry for a book on plants, was the seventeenth volume of THE JOURNAL OF HORTICULTURE!

Well, without any prelude I have passed on to Saltburn, and turning to notes previously taken at the British Museum, I find this extract from the Cotton MS. quoted in my previous communication:—

"At Saltburne Mouth a smale brooke dischargeth ytsel into the sea, which lyinge lowe under the banks, serveth as a trunk or conduite to convey the rumor of the sea into the neighbour fieldes; for when all wyndes are whiste, and the sea restes unmoved as a standing poole, sometymes there is such a horrible groninge heard from that creake at the least six myles in the mayne lande. that the fishermen dare not put forth, though thyrste of gaine drive them on, houlding an opinion that the sea, as a greedy beaste ravinge for hunger, desyers to be satisfied with men's carcasses."

The sea must have changed its diet since that was written, for I could not meet with any one that had heard its carcass-coveting "groninge." The "smale brooke," now travels quietly and deviously to the sea, between precipitous and

wooded cliffs, with broad varied surfaces below, and a fourth of a mile in length, affording the most beautiful site for a garden I ever traversed. It is laid out as a garden, and not a suggestion can I offer to improve its plan; the terraced walks, mostly under thickly shading trees, the seats, the alcove, are all judiciously placed, and the flower beds, croquet ground, and bedding-out at the extreme end near Mr. Bell's residence, Rushpool Hall, are well-arranged and well-cultivated; but the other portions of this "Happy Valley" are most offensively neglected and overwhelmed with weeds. I expressed my regret and surprise, but was met with the reply, puzzling to the most astute Chancellor of the Exchequer—"We have no funds." This should not be, and I venture to prognosticate will not long be, for visitors must increase in number, and if the inhabitants would raise a fund and open a subscription, there would surely be a sum annually subscribed worthily to sustain a garden capable of being made one of the most beautiful in England.—G

DEATH OF MR. JOHN GOULD VEITCH.

It is not yet twelve months since we recorded the lamented death of Mr. James Veitch, of Chelsea. It is now our painful duty to announce that of his eldest son, John Gould Veitch, a young man of great promise, at the early age of thirty-one. He was born in the nurseries at Mount Radford, near Exeter, April 17th, 1839, and died at the nurseries, Coombe Wood, near Kingston-on-Thames, on the evening of Saturday last.

At an early age Mr. John Gould Veitch took an active part in the management of the nurseries at Chelsea, and so early as 1861, when only twenty-one years of age, became one of its travelling collectors, and proceeded to China and Japan. He at the same time visited the Philippine Islands, and during that expedition he discovered and sent home many plants that now form important features in our gardens and horticultural exhibitions. He returned home for the Great Industrial Exhibition of 1862; and again left for the Southern Pacific in 1864, landing at Sydney, and afterwards proceeding as far north as Cape York and the Gulf of Carpentaria. He returned early in 1866, and shortly after his marriage, in February, 1867, he was attacked by a severe disease of the lungs, which has necessitated his wintering in the south of Europe for the last two years, and it has been by extreme care that his life has been preserved so long. On the Tuesday preceding his death Mr. J. G. Veitch visited Chelsea, and exhibited the greatest interest when he went over the whole of that vast establishment, and the same evening, on his return to Coombe Wood, he had a relapse of his complaint; and hæmorrhage of the lungs having set in, he gradually became worse till he sank on Saturday night through pure exhaustion. Thus died a young man of great ability, singular kindness of heart, and loved and esteemed by all who enjoyed the pleasure of his friendship. The funeral will take place in Brompton Cemetery this day, and the service will be performed by the Rev. Joshua Dix, of All-Hallows, Friday Street.

Among the numerous plants which Mr. J. G. Veitch discovered and sent home from his expeditions we may mention *Lilium auratum*, *Sciadopitys verticillata*, *Raphiolepis ovata*, various species of *Retinosporas* and *Osmantus*; *Abies firma*, *Alecoquiana*, *microsperma*, *polita*, and *Veitchii*; *Cryptomeria elegans*, *Ampelopsis Veitchii* and *japonica*; the handsome *Palm Veitchii* *Johanna*, *Juniperus rigida*, many sorts of *Bambusas* and *Ancubas*, *Cyrtopodium lævigatum*, and large quantities of the valuable Orchids *Vanda Batemanni* and *Dendrobium bigibbum*, which, however, had been introduced before, but were rare in Europe. Of *Crotons* he sent no less than twenty-three distinct kinds, and of *Dracenas* twelve or fourteen, among which were *Regina*, *Mooreana*, *Chelsoni*, and *Macleayi*. The beautiful *Phormium tenax variegatum* he sent in large quantities, and also the charming *Pandanus Veitchii*. The now popular *Acalypha tricolor* and *Amaranthus melancholicus ruber* were also of his introduction, and a new *Amaranthus* not yet sent out, called *salicifolius*. Then there were *Alocasia zebрина*, *Phyllanthus variegatus*, *Colens Veitchii* and *Gibsoni*, a number of fine *Lycopods* not yet sent out; these and many more, of which it is unnecessary to extend the list, were among the botanical treasures this indefatigable young man added to our collections during his short but brilliant career.

NOTES AND GLEANINGS.

A CORRESPONDENT writes to us remonstrating against what he calls "the pedantic use of the word PELARGONIUM AS

APPLIED TO THE OLD SCARLET GERANIUM class of flowers. Bedding or Scarlet Geraniums they were always called, and what necessity is there for calling them otherwise? We speak of Tall and Dwarf Nasturtiums, *Laurus Tinus*, *Althæa frutex*, and *Rose Acacia*, although they do not severally belong botanically to the genera *Nasturtium*, *Laurus*, *Althæa*, or *Acacia*. And why, then, this raid against our old favourite popular name of—Scarlet Geranium?" There is no doubt that the sudden adoption of the name *Pelargonium* in popular speaking and writing does startle old-fashioned and non-botanical gardeners. It was after visiting Mr. William Paul's Rose Show at the Crystal Palace a few months ago, we were returning to town in the railway train, and a lady and gentleman occupied seats in the same carriage with us. The gentleman had procured a copy of Mr. Paul's nursery catalogue at the show, and was carefully perusing it, when he ejaculated, "Pe-lar-gon-i-ums! What are Pe-lar-gon-i-ums? Do you know?" and the lady addressed confessed her ignorance. "Whatever they are, there are plenty of them," said the gentleman, and the subject dropped. Now, in all probability the name of Scarlet Geranium was well known to both. We confess to a weakness in favour of the old name when used popularly. It is like calling an old friend by his pet name after he has been ennobled.

— UNDER the name of CHINESE MUSTARD Messrs. Carter and Co., of Holborn, have sent us a pot of "small salad." In the form in which we have received it, the plant is stout and succulent, apparently more so than the ordinary Mustard, and possesses an agreeable though a powerful pungency. The seed which accompanied the pot is black, and much larger than that of the ordinary Black Mustard.

WORK FOR THE WEEK.

KITCHEN GARDEN.

THE *Celery* and most of the *Endive* being planted, the cultivation of the ground between growing winter crops should proceed in fair weather. This is a good time to plant *Hautbois Strawberries* about 6 or 8 inches apart in beds. Those planted earlier are apt to blossom in the autumn. Let all runners be trimmed off the Alpines, and slates placed under the plants. Cut all hard or bursting *Cabbages*, in order to secure a good crop of early sprouts on the stools to face the winter. Let late *Kidney Beans* be well earthed-up to protect them against storms, and top or pinch all inclined to assume a running character. In gathering *Kidney Beans*, good cultivators pick the old with the young at all gatherings, whether of use or not. It is astonishing how a few large or ripening pods will exhaust the plant, and hinder succession. The *Onions* which were laid down a fortnight ago should be removed forthwith to a gravel walk, and the ground well manured, and planted with late *Colerworts*; these will be very useful. *Shallots* should be housed directly; these require a warm and dry room, where they will often keep till May, or they will keep for a long period suspended in a Cabbage-net in a kitchen.

FLOWER GARDEN.

Those who are fond of early annuals, whether in pots in the mixed greenhouse, or in the flower garden, should sow soon. Stocks and Mignonette should be sown forthwith; the latter may be sown in a warm border and transplanted into well-drained pots, treating them with much care for a week afterwards. The Moss and Provence Roses for forcing should now be all turned round, if plunged, in order to break the roots through the bottoms of the pots; at the same time let all gross sucker-shoots be cut away. The filling-up of blanks, staking and tying-up, mowing, cleaning, and rolling, will, of course, go on as usual. Lose no time in putting-in an abundance of cuttings of flowers for next year's masses. *Auriculas* may now be repotted. All decayed leaves should be removed, but this must be done carefully, otherwise more injury will be sustained by the plant than many people imagine. In potting, should the plant appear at all unhealthy, carefully remove the soil without breaking the ball, and examine the tap root. Should this be decayed or cankered, as is sometimes the case, it must be cut completely away. Avoid all complicated stimulating composts, for, however, fine the plants may grow, the health of the stock will be jeopardised. Well-decayed leaves, with turfy loam, will form a good compost for wintering the plants in. Many Tulip bulbs, from the serious check they experienced last blooming season, and which reduced in numerous in-

stances their bulk one-half, will require to be moved from the situation they hold in the best bed, as they will not bloom satisfactorily, and their places filled from the reserve beds or other quarters with bulbs which will bloom in similar character, so that the uniformity of the collection may be maintained. Pay strict attention to the soil for the ensuing planting season, turning it over occasionally in order to sweeten it. Continue to put out Pink pipings, and attend to the directions given last week relative to potting the layers of Carnations and Picotees. Pansies will now strike very freely, and when the weather is suitable plant out seedlings in beds of rich-prepared compost. Examine Ranunculus roots, being careful that they do not contract damp, and pay strict attention to Dahlias, which now require much care. Young shoots may be struck in brisk heat, and the regular routine of tying, disbudding, &c., must be persevered in, not forgetting to carry on continual war against earwigs and all destructive insects.

GREENHOUSE AND CONSERVATORY.

The time has now arrived when plants intended to supply a floral display under glass during autumn and winter must have attention. Let Begonias have another shift if not already in pots sufficiently large. Keep the plants thin that their foliage may be preserved from injury. *Crowea saligna* and *Plumbago capensis* are both valuable autumn-blooming plants, and the latter furnishes large supplies of cut flowers. Attend to *Chrysanthemums*, and water freely with liquid manure; good specimens should be aimed at rather than a few fine blooms. The earliest winter-flowering Heaths and Epacrises must soon be placed under glass, as it will forward their blooming. The appearance of bulb catalogues, too, tells us that Hyacinths and Narcissus for forcing must soon occupy attention. About equal portions of good loam and decayed leaf mould, with silver sand, will be the best soil for them if for forcing, but well-decomposed cow dung must be substituted for the leaf soil when the bulbs are intended for late flowering. After potting place them on a dry bottom, and cover the pots 2 or 3 inches deep with old tan or ashes, preserving them at the same time as much as possible from heavy rains; under this treatment they will fill their pots with roots, and will be in readiness for forcing when wanted. Van Thol Tulips for forcing may be potted early next month. Place them on coal ashes, cover them as recommended for Hyacinths, and early in November remove them into heat; the principal bulk need not be potted until late in October, and a last batch of *Tournefortia* or *Rex Rubrorum* towards the end of November. Where conservatory borders or beds exist, see that they are duly watered. Examine the plants individually, as their wants will be various. Arrangements must be made forthwith for housing tender plants. There is in many cases no necessity to have them all in at once; let it be done progressively, according to their wants. A few of the more showy annuals, such as the *Collinsias*, *Clarkias*, *Leptosiphon*, *Erysimum*, *Iberis*, *Lasthenia*, *Eutoca*, *Nolana*, and *Calandrinia*, may be sown now in pots and kept in cold frames through the winter. They will serve to decorate the shelves of the mixed greenhouse early in spring, as well as to enliven the early flower beds or borders. A nice turfy loam, rather old, will be better than rich composts, the object being to obtain a stiff and healthy plant, capable of enduring a hard winter. There will also be more colour in proportion to the amount of foliage—a most important matter in the cultivation of annuals. Where valuable stove plants have been kept in the conservatory in bloom, they will require careful management to prevent their being injured by damp, and they must not be overwatered at the root, as stove plants are soon injured by a low temperature if the soil is kept too wet. Give air freely in bright days, but if the house contains many stove plants, it will be advisable to shut up rather early in the afternoon, so as to retain a little warmth for the night; and in the event of wet, cloudy weather continuing, it will probably be found necessary in old-fashioned, badly-glazed houses to use a little fire heat to preserve the blossoms of tender plants, and this should be seen to before handsome specimens become disfigured or ruined for the season, for those in bloom are not over-plentiful in most places, and are therefore worth caring for. Keep everything in this house as clean and neat as possible, removing decayed leaves and flowers immediately they are perceived.

STOVE.

Ripen growths for the winter, day by day. Continue to increase the amount of air in general, and to slightly decrease the amount of atmospheric moisture. Examine pot specimens

frequently, turning them partly round in order to expose all their sides equally to light and air.—W. KEANE.

DOINGS OF THE LAST WEEK.

We had a slight rain for a short time on the 7th and 10th inst., but not enough to do more than moisten the surface a little, without placing anything appreciable in tanks or reservoirs. Better harvest weather there could not be, as even these showers and some heavy dews helped to swell the grains of corn. For everything growing the weather has been most trying. The drizzling rain on the forenoon of the 10th helped to refresh the foliage, and until the moisture at the surface was evaporated the foliage felt the benefit of the vapour as it passed upwards. But, singular to say, the plants thus refreshed suffered greatly from the bright sun of the following day—far more than they did in the bright days before the refreshing shower came. We account for it on the principle frequently alluded to—that the surface-damping before it was quite evaporated prevented the roots absorbing moisture from beneath, and thus they were unable at first to meet the rapid evaporation of the foliage when the sun shone brightly, and the surface moisture was nearly evaporated. Those placed under similar circumstances, who watched such results on a large scale, would be taught the impropriety of resorting to mere surface-watering, and that it was in general better not to water than so to water as not to reach the bulk of the roots.

KITCHEN GARDEN.

Artichokes.—The Jerusalem Artichoke, with its tubers, and the Globe Artichoke, with its rough heads, have suffered much with us, though both were mulched, and the latter once well watered with sewage. The former, like our Hollyhocks, have such short stems that they will suffer little from high winds this season; the latter, though yielding a fair produce in the first part of the season, look now as if the autumn produce would be scanty indeed—a matter of importance where such things are much in demand.

Asparagus and *Sea-kale* never looked more healthy, though watering them was quite out of the question, but a slight salting about May has helped to keep the ground moister than it would otherwise have been.

Autumn Peas, we fear, will be thin and scarce, notwithstanding all our trouble; but Dwarf Kidney Beans and Scarlet Runners are abundant, though in some cases suffering from the dryness.

We sowed Spinach, Tripoli Onions, Radishes, Turnips, and Lettuces in well-pulverised soil, but to the depth of at least 18 inches it was so dry that sowing in the usual way would have been seed and labour thrown away. There could be no vegetation until there was a good heavy rain, and we may yet wait a long time for it. All the vegetables named were sown in rather deep drills for the seed, the drills having previously been well drenched with sewage put on twice at a short interval between the applications. In about an hour the surface of the watered drill was sufficiently dried to permit sowing, and then the seeds were slightly covered with the dry soil at the sides. This encourages germination at once, and the rootlets have something to entice them to go down.

Cauliflowers.—Until lately we never had better, larger, more compact heads; but the heat and the dry air are becoming rather too much, many of the heads losing compactness, and coming like loose Sprouting Broccoli. Even a fair watering with sewage has not in a good many cases arrested this evil. In hot, dry summers August and the first half of September are the most difficult times to obtain fine, compact Cauliflowers. Partly on this account we like to gather all for preserving and pickling early. In the cooler times—towards the end of autumn, the Cauliflowers will again be close and crisp. A dripping, rather shady summer suits the Cauliflower best.

Potatoes.—All the early kinds have proved extra fine, prolific, and clean. With us the later kinds will be smaller than usual, especially where, from crowding, they scarcely had justice. It was astonishing to find such masses of tubers in soil so dry that it might have come from a hot oven. In many cases the small feeding fibres had gone to a good depth. A few tubers have commenced growing again, a sure sign that they will do no more good by remaining. We noticed this among a few of the Walnut-leaved Kidney, and had them taken up forthwith, as they are ripe enough. Still, but for the above, we would have given them a week or ten days more to make the tubers more mealy.

Most of such ground, though very dry, we have planted with

Broccoli and Winter Greens, watering the plants well first, letting them stand a little in a pot of thinish mud, planting them out in drills, and soaking each plant with sewage. We are alluding to those planted with the dibber. Those pricked out previously were carefully watered and lifted with balls. Those dibbled out are looking better than could have been expected, but they will grow slowly until we have duller and damper weather.

We find from several notes that this season will force many like ourselves to make arrangements for securing a larger water supply in summer. In most districts plenty of water falls, if part of it could only be secured for summer use. No doubt draining has been serviceable to the land, but if nothing is thought about except disposing of the water, we may make our fields next to barren from dryness if we have no stored-up supply from the drainage. It is possible to carry a good principle too far. One or two facts, or seeming facts, are worth mentioning for consideration.

The first is, that though all fine-pointed matter when fully exposed to a clear sky becomes rapidly cooled, and therefore a good condenser of vapour near it, yet it seems that even in this respect there is a difference in the condensing power of comparatively dried, inert points and the points of living substances. For instance, we have repeatedly noticed this season that after a clear starry night the exposed places of our brownish short-cropped lawns, and the larger bent grass on the quite-as-brown park, would be so destitute of dew that the finest satin slipper of a lady would not be damped; in fact, so far as the feeling of the hand went, no moisture whatever could be detected, whilst in a few places where the grass, from some peculiar circumstance, remained green, there you might have washed your hands in dewdrops. It would not be fair from such limited observation to deduce an inference, or we would say that the inference would be that it is possible to make land so dry that the grass on it may become so withered as to be unable to condense for itself the fair amount of dew to which otherwise it would have been entitled. As another fact bearing on this subject, we may mention that this hot summer we have frequently noticed that healthy, flourishing plants in flower beds would be slightly dewed in the morning, whilst the short, brownish lawn around them was perfectly dry.

One other fact is worthy of consideration and observation. The rains this summer have been something like deluges in some places, and mere drizzles in others. We have frequently seen the rains fall heavily only a few miles off, whilst we had not enough to damp the mere surface. We do not here speak so much from facts as a kind of belief from observation, that there seems to be an attraction between a dampish soil and a watery cloud; so much so, that the cloud will sail past the dry soil, and shed its resources on that which is damper. If there should be any truth in such an inference, then extra draining without husbanding may not only leave a scarcity of water, but may prevent such drained land obtaining its due share of moisture from the clouds. In such a fitful season as this, as respects moisture, it would be well worth observing and noting whether highly-drained land or the reverse had received the greater amount of rainfall.

In the enthusiasm for improvement it is just possible to make fields too large, and to leave too few trees standing. We know of places quite changed in this respect. Where small fields and meadows with hedgerow timber made the country look like a forest from a distance, all is now open, and scarcely a tree is to be found. We have no doubt that such districts are now very different as respects moisture. Every tree not only absorbs moisture, but it is a first-rate collector. When, after clear nights, our brownish lawns were almost dust-dry, it would not have been difficult to have collected barrowloads of mud from beneath some large Ashes and Beeches. The time may come, if such seasons as this continue, when, instead of rooting out every tree from cultivated lands, such as hedgerows, we may be forced to plant again in order to obtain moisture-distillers. The more pointed and healthy the foliage, the more will be its condensing power. One morning, with the brownish grass in the park almost quite dry, a large Beech tree was sending quite a shower of sweet water to the ground beneath, where it stood in little pools.

Protection for Winter.—Some rough-and-ready material is very useful for late Cauliflowers, Broccoli, roots of tender plants, and throwing over mats and frames. Nothing is better for such purposes than rough hay, and from some outlying places in the pleasure grounds we used to collect and keep some for this purpose. This season we have not saved more

than will be required for Mushroom beds. There has been so little hay in this neighbourhood that we know it will be of no use going after such material to the farm. We know that though corn crops on the whole are good, the straw is short, and it will be wanted for feeding as well as littering purposes. We have, therefore, secured ourselves, and will yet collect more as a substitute. We obtain a certain amount of stable dung, chiefly litter with some droppings. We could make little use of it in the ordinary way, as we could not command water to moisten and work it. We had it, therefore, well shaken to get droppings, &c., out of it, well dried, and built as we got it into a stack, which we shall cope with itself, and with this litter now well dried we feel we shall be tolerably independent as respects protection for the winter.

Turf Heaps.—Where the soil is not so dry as ours, now is the best time of the year for making a heap. There is no better plan than making such heaps in parallelograms of from 3½ to 4 feet in width, raising them to a height of 4 or 5 feet, and then drawing gradually in with a hipped roof in form like the letter A. We used to cover the hip with turf, the grass outside, fastened with wooden pins, to ensure dryness; but we find the outsides of the ridge soon become green, and that dryness is sufficiently secured without any such trouble. When the hip roof is formed we merely beat it on each side with a spade. These heaps nicely piled should not be wider, or the air will not play through the layers. The object of the heaps is to have the soil thoroughly sweetened without wasting or rotting the fibre.

FRUIT GARDEN.

Gathered quantities of Apricots, even when not quite ripe, to save them from wasps. The wasps are not now so troublesome, as we found and destroyed some large nests. A few cool nights would be the best relief, though other means must be tried.

General operations have been much the same as last week. On the 13th all trees fully exposed to the sun suffered much from the heat and the wind, Peach trees even hanging their leaves; and if we have not a few dull days we must try if possible to help them at the roots. This season will try a good many plans and systems. Shallow borders and bottomed with concrete, slabs of stone or tiles cemented, were all the rage at one time. It would be well to know in what kind of borders trees have stood best this season where they could not be helped with much water. We know that moisture in the form of vapour will rise through firm substances, as we have seen a good deal of moisture condensed under large bell-glasses set on a firm, dry, gravel walk, and even on exposed stone pavement. Still, we do not think that moisture in the form of vapour will rise so freely through such tiles and stone flags as through the more open general soil, and therefore some facts and observations in this respect would be valuable. Perhaps we may find in the end that a deepish loam is no bad thing if by surface mulching we can only encourage the roots to keep near the surface. They would then be more independent of moisture in dry seasons, and they would not be encouraged too deep and become too luxuriant in moist seasons. Many of our Apples are falling, and the general crop will be smaller than usual unless rains come quickly.

ORNAMENTAL DEPARTMENT.

Much the same as last week. Lawns needed nothing except a switch with the daisy knife; walks were put into good order; and potting and cutting-inserting were the chief work engaged in. The flower beds have as yet stood well.—R. F.

TRADE CATALOGUES RECEIVED.

H. Camell, Station Road, Woolwich.—*Autumn Catalogue of Fuchsias, Pelargoniums, Verbenas, &c.*
 Sutton & Sons, Reading.—*Catalogue of Bulbous Flower Roots, Plants, Seeds, &c.*
 Child & Lorimer, 49, Darley Street, Bradford, and Bradford Nurseries, Shipley.—*Catalogue of Dutch Bulbs, &c.*
 Ferdinand Gloede, Beauvais (Oise), France.—*List of New and Splendid Strawberries.*

TO CORRESPONDENTS.

** We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

BOOKS (H. T.).—The "Cottage Gardeners' Dictionary," which you can have free by post from our office for 7s. 2d.

NETTING FOR FRUIT TREES (J. P.).—We are sorry we cannot assist you to the address you require.

MORETON BAY CHESTNUT (Fibula).—This plant has been introduced to this country as well as some of the fruit. It is not yet common in England, and we are not aware to what extent it has been exposed to our winter climate. If it will do anywhere, the Sussex coast will be as favourable as any. We do not know where the Buaya-Buaya is to be procured.

BUDGING PEACHES (E. G.).—From now till September is a good time for budding. You must skilfully extract the wood from the Peach buds before inserting them, and you may use the double or triple buds indiscriminately.

GRAPES MILDEWED (T. V.).—Your Grapes are severely attacked by mildew, the remedy for which is flowers of sulphur dusted over all the parts affected. Keep the air of the house dry and well ventilated, and do not allow the Vine to suffer from want of water at the roots.

GRAPES NOT RIPENING (A. T.).—Your Vines are overcropped, and your border, though inside, does not keep the roots there; they have evidently got into a soil which is ungenial to them. It is a case which is not unusual.

EXHIBITING FRUIT (A Young Gardener).—1, 2, 3, 4, 6, 7, 8, and either Apricots or Plums according to their quality, the former the more valuable. Black and White Grapes, and Peaches and Nectarines, are, of course, distinct varieties, and no judge could disqualify on that account. On the contrary, to have both Black and White Grapes would enhance the merit of a collection.

THE ALMOND (A. B.).—We have little doubt that the Almond is "the parent of our present race of Peaches," but how or when the hard husk became succulent we cannot tell; not by impregnation, certainly, but in all probability it arose from certain conditions in which the original abnormal tree was placed, and then culture would probably secure and develop the new form.

SHOWING ROSES (Felix Genaro).—You must show twelve trusses of Roses, a truss being any number of blooms provided they are all grown on one stalk. You must not the several blooms together, or you will be disqualified, or ought to be.

CINERARIAS DISEASED (Oh! Subscriber).—Your Cinerarias appear to be suffering from mildew. Dust them with flowers of sulphur, and give more air.

HEATING A SMALL FORCING HOUSE (H. S.).—The proposed plan will answer if your flue is strong and covered with strong ties or flues. We would make the first half of the flue in the chamber at least brick-on-bed. It will not heat so soon, but it will retain heat. You will also need some means for ensuring a moist atmosphere. One ventilator over the doorway will not do. You will want three or four at the apex of the roof, however small the openings in winter. The aspect will also be against you unless you make your short hip longer, but for Cucumbers it may do.

TRANSPLANTING MULBERRY TREES (E. M. M.).—We would recommend you to transplant your Mulberries immediately after the fall of the leaves, or when they are being shed. As the roots from the stumps may not be very vigorous this season, and tender, try one only, and leave one for next year.

STRAWBERRIES (E. Jones).—We recommend Dr. Hogg as a first class variety, of vigorous constitution, large size, and of most excellent quality.

PLUM LEAVES INJURED—MARIE LOUISE PEAR (An Amateur).—We believe the leaves of your Plums to be in great part destroyed by some insect, the tissues seeming to be eaten up. Give them a syringing with a decoction of quassia chips, or soft soap and tobacco water. The Marie Louise Pear will not grow if grafted on the Quince. It must be double-worked on that stock—i.e., some other variety grafted on the Quince first; for instance, Benrre d'Amansis, and the Marie Louise worked on that.

HOYA CARNSOSA SEED SOWING (A Foreigner).—It is not uncommon for the plant to seed in this country, though it is rather unusual for it to do so in a greenhouse. The seed should be sown in a sandy peat soil in a pot well drained, the soil being mixed with rather small corks and silver sand, so as to keep it open. Care should be taken to just cover the seed with fine soil. Water gently, and place the pot in a bottom heat of about 75°. Keep the soil moist, but not very wet, otherwise the seeds will perish. Continue in the hotbed until the plants are potted-off and established in small pots, then remove them to a stove or warm greenhouse. The seedlings you allude to are kept for exchange and for distribution to other botanical gardens.

CONSERVATORY PLANTS INFESTED WITH RED SPIDER (T. H. T.).—As you cannot use sulphur on the hot-water pipes, we would advise you to employ one of the insect-destroying compounds you will see advertised in our columns, or you may dip or syringe the plants in a solution of 2 ozs. of soft soap in a gallon of water; but it must only be applied to plants with smooth, not hairy, leaves. A few good syringings with clear water are as good as anything for the prevention and destruction of red spider. It is not often that Foras are attacked by red spider, thrips are their great enemy. Fumigation with tobacco is the remedy.

VARIOUS (Idem).—The espalier Cherry and Pear trees which have not shown a leaf this season we fear are beyond recovery. Those which are weak, and have made but little wood, we would manure well or mulch with manure as far as the roots extend, and in spring point it in, not going so deep, however, as to injure the roots. No time should be lost in sowing Calceolaria and Primula seed to produce plants for flowering next spring. We sow Primulas in spring for autumn and winter bloom,

and in July or August for spring flowering. Calceolaria seed we think best sown in July. Pampas Grass after flowering may have the dead flower-stalks cut away, but the grass should all be left, as it serves to protect the plant. It should not be removed until the plants begin to grow again, or in April. The "Portable Orchard" appeared in Nos. 411, 412, 413, 414, 416, 417, 418, 421, 423, 425, 426, and 428.

SURPLUS FRUIT (Constant Reader).—Apply to Mrs. Webber & Co., Central Avenue, Covent Garden Market, London, W.C.

APRICOTS (Hortus Apricot).—Your trees are starved. They are either very old or in very poor soil. Manure them well in the autumn by taking away the soil in which they are now growing, and filling up the space with a mixture of good loam, lime rubbish, and well-rotted manure.

ANTS (Heron).—Mix treacle with arsenic, and spread it thinly on pieces of glass or tiles which lie near their haunts. This will soon rid you of these pests. You had better allow your Potatoes to remain in the ground and give the new crop a chance of ripening. You will be no worse off in the end than you are now, and there is no remedy for your present difficulty.

NAME OF INSECT (G. Egerton).—Your caterpillar is that of Sphinx Ligustri.

NAMES OF FRUITS (A Reader for Profit).—1, Royale Hative; 2, Standard of England; 3, Fotheringham. (C. Winn).—We cannot determine the name of your Apple.

POULTRY, BEE, AND PIGEON CHRONICLE.

POULTRY FEEDING IN FRANCE.

We have spoken previously of the large supply and excellent quality of French poultry, in order to show how valuable an article of food it supplies to our neighbours. We are now enabled to relate, from an official report, in what manner, at what cost, and with what profit poultry is fattened in France.

M. Martin, who resides near the town of Casset, is the inventor of a peculiar method of management of poultry, and has attracted so much attention to his system, that the Agricultural Society of Allier appointed a commission to visit and report upon his establishment.

The feeding-house is a large rotunda, situated in the midst of a park of ten acres in extent, and on the summit of a tolerably elevated hill. In it are three octagonal stands which turn on a vertical axis; each side of the stand has five perches, and each perch receives five birds, or two hundred in all. The fowls are divided off from each other by means of small slabs of wood placed vertically on the perch, and are secured to the latter by means of strips of hide around the feet, leaving their heads and wings at full liberty. The feeding is effected in the following manner:—The operator has a small seat, which he can shift upwards and downwards in order to reach the various cages; he takes the head of the fowl opposite to him in his left hand, and with his right places in its gullet a small tin nozzle which is attached to a flexible tube communicating with a reservoir containing the food, so that a touch of the foot on a treadle projects the desired quantity into the fowl's stomach. A graduated dial, with a hand in connection with a piston, serves to regulate the amount of food according to the age and kind of bird, and the degree to which it has been fattened. The feeding is performed with great rapidity, an hour being sufficient for two hundred birds, or one frame, and the fowls seem to enjoy it, looking sharply after any stray drops of food that may have fallen within their reach. This food consists of barley and maize meal mixed with lard, and reduced with milk to almost a liquid state. The fowls are kept scrupulously clean, the droppings falling on sloping boards behind the perches, and thence towards the centre; every morning cut straw is thrown upon it, and the whole is swept into a hole near the centre, where it is received in an iron barrow running in a channel beneath the frame. When the fowls are ready for market, they are placed in a dark but well-ventilated apartment, and left without food for twenty-four hours; they are then suspended by the feet, a cloth is passed round them to prevent movement, and a small instrument is introduced into the throat so adroitly that they are killed instantaneously. They are then plucked, washed, drawn, wrapped up in wet cloths to cause them to cool rapidly, and placed on stages that the blood may escape freely. From thirty to forty are sent to market daily.

The reports speak highly of all the arrangements made by M. Martin, which are the results of many trials, and especially those for the radical destruction of the mites which infest all fowl-houses. M. Martin patented his system in 1867. The fowls fattened under this system have obtained for M. Martin several medals, and the Commission is of opinion that they are amongst the finest sent to market. As regards the economy of

the system, the report takes for basis the cost per day of fattening six hundred pullets, aged from three to four months; those to which it has been principally applied. The duration of the fattening is eighteen days, and one man and woman do the whole work, so that the great economy of the plan is easily demonstrated. In feeding by hand, one person cannot cram more than twenty birds an hour, or thirty at most with the use of a funnel, while under the new system two hundred are fed in an hour. The bill of coats for one day is thus set forth:—

Purchase of 33 lean pullets, at an average cost of 2 <i>l.</i> each ..	66 <i>l.</i> 0 <i>s.</i>
60 kilogrammes of meal, at 2 <i>s.</i> ..	15 0
Food for 600 { 30 litres of milk, at 1 <i>s.</i> ..	4 50
2 kilogrammes of lard, 1 <i>l.</i> 6 <i>s.</i> ..	3 20
Wages of a man and woman ..	3 50
Loss at the rate of 3 pullets per 100 ..	2 0
Interest on cost of material valued at 2000 <i>l.</i> ..	0 40
Rent of building at 3 <i>s.</i> 6 <i>d.</i> per annum ..	1 0
Paid for plucking, &c., 6 <i>s.</i> per head ..	1 65
Sundry expenses ..	3 0
Total.....say	£4 0 0 100 25

This brings the cost of a fattened pullet to a trifle over 2*s.* 5*d.*, or 50 per cent. more than the price paid for it originally. But there are certain deductions to be made from the expenses incurred—sale of feathers, manure, blood, and offal, which diminish the cost of a fat pullet to little more than 2*s.* 3*d.* To form, however, an exact estimate of the cost, it is necessary to take weight into account. The ordinary pullet of Allier at the age stated weighs 950 grammes (nearly 2½ lb. avoirdupois), and, when fattened, plucked, and ready for market, 1,123 grammes. This brings the cost to 2*l.* 5*s.* 3*d.* per kilogramme, or 11*d.* per lb. M. Martin sells his fat pullets at 3*l.* 5*s.* 0*d.* Better results still are said to be obtained with the breeds peculiarly adapted to fattening, such as that of La Breasse; pullets of this race weighing 2½ lbs., and doubling in their weight during the fattening. The plan is applicable to other poultry besides pullets. Last winter Capons, Ducks, and Turkeys were fattened by the same means with success.

The Commission expresses its surprise at the results achieved, especially considering that M. Martin has inaugurated his system in a part of the country where no progress has been made in the rearing of poultry, and where the breed of fowls is not the best adapted for fattening, and it believes that the plan may be made the starting point of a radical improvement in the rearing of poultry, which hitherto has been little appreciated, except in certain districts. France exports annually eggs to the amount of 18,000,000*l.* (£720,000), and only imports one-sixth of that amount, which proves that the climate is well adapted for poultry. If establishments like M. Martin's were set up in every department of France, and every district of England, they would become perfect manufactories of poultry, for the farmers would then always have a market for their chickens, as fattened poultry always finds ready purchasers. Moreover, the produce in manure would not be unimportant, for each pullet fattened by M. Martin gives on an average 2½ lbs. of dry manure, said to be equal to the best guano of Peru. Another great point is the health of the breeders as well as of the fowls. Poultry fattened by hand is generally kept in narrow cages, often in barrels, without a proper supply of pure air; and in the midst of all the filth, the persons who feed them tie three of the unfortunate birds together by the legs, and then cram them alternately with fifteen or twenty balls of food in spite of their violent struggles; and it is surprising how the feeders themselves live in the vitiated air around them.

In M. Martin's system the fowls are always surrounded by pure air, everything is kept scrupulously clean, washed, and disinfected by means of sulphate of iron; the birds suffer in no way from the mode of feeding, and are almost invariably healthy, and the feeders have but little to do. It has been proposed to set up a model feeding establishment in the gardens of the Acclimatisation Society in the Bois de Boulogne.

There is little doubt that many supplies of food are capable of great extension, and that poultry, whether reared naturally with the aid of houses on wheels, or on Martin's system, offers to farmers and others a fair prospect of remunerative occupation. Perhaps in time we may see realised the hope of Henri de Navarre, that every peasant should have a fowl for dinner on Sundays.—(*Food Journal*.)

DURHAM COUNTY POULTRY SHOW.

The Poultry Show in connection with the Durham County Agricultural Society's Exhibition was held on the 9th inst. at Sunderland.

It was the Society's twenty-seventh meeting, but the first on which poultry was introduced. The Show was quite a success, and most of the classes were well represented. Turner's pens were used, and every care was taken of the birds by the Committee.

Of *Dorkings* and *Cochins* there was only a small entry; of *Spanish* there were nine pens, but most of them were in the moult; the prize *Brahmas* were good. There were nine pens of *Red Game* in the adult class; the first-prize *Brown Red* was a splendid bird, and in good condition; the *Black Red* second-prize bird was also very good, but a little out of condition. There were ten pens of *Spangled Hamburgs*, some of them of great merit; the same may be said of the *Pencilled Hamburgs*. The *Polands* mustered nine pens, but many of them were not so good as we should have liked to have seen. There were eleven pens of *Red Game* chickens, some of them very promising, but a little too young for the exhibition pen. Of *Hamburg* chickens there were eleven pens, and in the "Any other variety" class eighteen pens, some of them of first-rate character. The cup for the best pen went to an excellent pen of *Brahma* chickens in this class. There were eighteen pens of adult *Red Game Bantams*, and twenty-one pens of chickens. The cup was awarded to a very good pen in this class.

DORKINGS (Any variety).—1, J. White, Warlaby, Northalerton (Grey) **COCHINS** (Any variety).—1 and 2, G. H. Proctor, Durham (Buff and White). **SPANISH** (Any variety).—1, G. Holmes, Great Driffield. 2, W. Elliott, Bishop Auckland. *hc*, W. Bearpark. **BRAHMAS** (Any variety).—1, E. Leech, Rochdale. 2, J. Stalker, West Sleaford. *hc*, G. Todd, Bishopwearmouth. **GAME**.—*Black-breasted or other Reds*.—1, T. Robinson, Bishop Auckland. 2, J. Brough, Carlisle. *hc*, W. Rodgers, Bishopwearmouth. **BULLOCKS & WILLS**.—1, W. Stone, Any other Variety. —1 and 2, J. Robinson (Duckwings). **CHICKENS**.—1, J. Dixon, 2, J. Hardy. *hc*, T. Dent, Sunderland; W. Bearpark, Anderby Steeple. **HAMBURGERS**.—*Gold and Silver-spangled*.—1, H. Pickles, jun., Earby, Skipton. 2, W. Bearpark, Anderby Steeple. *hc*, H. Pickles, jun.; W. Whitfield, Hutton Station; G. Holmes, Great Driffield. *Gold and Silver-pencilled*.—1 and 2, H. Pickles, jun. *hc*, W. Hall; W. Bearpark. **CHICKENS** (Any variety).—1 and 2, H. Pickles, jun. *hc*, C. Armstrong, Bedlington (Silver-pencilled). J. Brown & Co., Water Works (Silver-pencilled). **EGGS** (Any variety).—1, J. Brown. 2, H. Pickles. **ANY OTHER VARIETY**.—1, R. Loft, Woodinsey (Sultans). 2, E. Hawkins, Seaham (Malays). **CHICKENS**.—Cup, E. Leech. 2, H. Pickles, jun. (Polands). *hc*, J. J. Waller, Kendal (Coloured Dorkings); T. W. L. Hind, Kendal (Dorkings); J. White, Warlaby (Grey Dorkings); G. H. Proctor (White Cochins). *c*, W. Bearpark; E. Brown (Spanish). **GUINEA FOWL** (Any variety).—1, G. Todd. 2, J. S. Chaloner, Benwell Lodge. *hc*, H. Forest, Durham; T. C. Harrison, Hull. **TURKEYS**.—1, E. Leech. **DUCKS**.—1, W. Stone, Whiteby. 2, E. Leech. *Any other Variety*.—1, E. Leech. 2, Rev. J. G. Milner, Bellerby (Rouen). *c*, Rev. J. G. Milner (Rouen Duckings); T. C. Harrison. **SELLING CLASS**.—1, G. Todd (Partridge Cochins). 2, G. H. Proctor (Buff Cochins). **BANTAMS**.—*Game* (Black-breasted and other Reds).—1, D. Hunter, Nile Street (Black Reds). 2, W. Grey, Tow Law (Black Reds). *hc*, W. Rodgers (Brown Reds); T. Wigham, Sunderland (Black Reds). **CHICKENS**.—Cup, T. Clark (Black Reds). 2, Hunter. *hc*, F. Steel, Halifax (Brown Reds); T. Clark (Black Reds). *Any other Variety*.—1, J. F. Fry (Duckwings). 2, J. Hurrell (Duckwings). *hc*, Bullass & Williamson (Lemon Piles). *Any other variety*.—1, S. & R. Ashton, Mottram (Black). 2, E. Youll (Black Rose-combs). *hc*, W. Dixon, Bishopwearmouth (Black Rose-combs). **CHICKENS**.—1, S. & R. Ashton (Black Rose-combs). 2, T. C. Harrison, Hull.

Mr. James Dixon, of Bradford, was the Judge.

LISKEARD POULTRY SHOW.

The second annual Poultry Show held at Liskeard on the 4th inst. was a great success, the entries having been three times as many as last year's, and some of the birds, especially in the *Dorking* and *Game* classes, being of high merit. The cup given for the best pen of *Game* was won by Mr. J. H. Reynolds, of Redruth, closely pressed by Mr. J. Jeken. A noted local breeder of *Game* fowl exhibited some fine birds in each of the *Game* classes, notably some *Henny* and *Tassel* chickens, said to be the purest strains of those scarce breeds, but being on the Committee he withdrew them from competition. Exhibitors visiting the Show were pleased with the care and attention given the birds by the Committee.

GAME.—*Black-breasted and other Reds*.—1 and Cup, J. H. Reynolds, Red rath. 2, J. Jeken. 3, J. Beard, St. Blazey. *Duckings and other Greys and Blues*.—1, J. Hancock, Liskeard (Silver-Grey). 2, J. H. Reynolds (Black). 3, Withheld. *Tassels, Hennes, and any White-legged Variety*.—1, W. Kenrick, Menheniott (Tassels). 2, G. Martin, Devonport. Extra 2, J. H. Reynolds (Hennes). 3, H. Roberts, St. Cleer (Hennes). **MALAYS**.—1, J. Toll, Menheniott. 2, C. White, Liskeard. 3, J. Bone, Liskeard. **DORKINGS**.—1 and 2, E. Burton. **SPANISH**.—1, S. R. Harris, St. Day. 2, Mrs. Smith. 3, J. H. Nickolls. **COCHINS**.—1, W. Humphreys, Liskeard. 2, J. Long, Plymouth. 3, F. Brewer, Lostwithiel. **BRAHMAS**.—1, Mrs. Smith. 2, J. Beard. 3, J. H. Nickolls. **POLANDS**.—1 and 2, J. Beard. 3, Miss Webber, Exeter. **HAMBURGERS**.—*Pencilled*.—1 and 2, S. R. Harris. 3, R. Courtney, Liskeard. *Spangled*.—1 and 2, S. R. Harris. 3, J. Roberts, Menheniott. **BANTAMS**.—1, C. White. 2, Miss Webber. 3, S. R. Harris. **ANY OTHER VARIETY**.—1, J. Nickolls (Black Hamburgs). 2, S. R. Harris (Minorca). 3, F. Brewer (Minorca). **SELLING CLASS**.—1, J. J. Waller. 2, Truro (Golden-pencilled Hamburgs). 3, W. Tolland, Liskeard (Crested Polands). 3, J. Hancock (Game Hennes). **DUCKS**.—1, J. E. Hawken, Lostwithiel (Aylesburies). 2, E. Burton (Rouen). Extra 2, Miss Webber (Mandarin). 3, S. R. Harris. **GESE**.—1, T. Burrows, St. Cleer. 2, S. Bone, Liskeard. **TURKEYS**.—1, Mrs. Smith. 2, Withheld.

PIGEONS.—*Carriers*.—1, E. Burton. 2, J. S. Richards, Truro. *Tumbler*.—1, E. Burton. 2, A. Bailey, Liskeard. *Jacobins*.—1, W. C. Herring, Menheniott. 2, Mrs. Lander, Menheniott. *Fantails*.—1, S. Richards. 2, J. Oliver, Liskeard. *Common*.—1, E. Burton. 2, S. Richards.

Mr. Leeworthy, of Barnstaple, was the Judge.

BLACKPOOL POULTRY SHOW.

The following awards were made at this Show, held on the 10th and 11th inst.

DORKINGS.—*Grey*.—1, T. Briden. 2, J. Robinson. *White*.—1 and 2, J. Robinson. *Cock*.—1, J. Robinson. **BRAHMAS**.—1, J. H. Pickles. 2, J. Watts, Spanish. —1, C. W. Brierley. 2, H. Beldon, Bingley. **GAME**.—1 and 2, C. W. Brierley

Middleton. *Cock*.—1 and 2, C. W. Brierley. *COCHINS*.—1, T. Stretch. 2, H. Green. *HAMBURGS*.—*Golden-pencilled*.—1, H. Beldou. 2, B. Bee. *Silver-pencilled*.—1, J. Robinson. 2, H. Beldou. *Golden-spangled*.—1, J. Robinson. 2, H. Beldou. *Silver-spangled*.—1, G. & J. Duckworth. 2, H. Beldou. *Black*.—1, C. Sidgwick, Keighley. 2, H. Beldou. *BANTAMS*.—1, J. Watts. 2, G. Anderson. *CREVE-CŒUR*.—1, H. Beldou. 2, E. Cross. *HORDANS*.—1, H. Beldou. 2, J. Robinson. *ANY OTHER VARIETY*.—1, J. Watts. 2, H. Beldou. *GEESE*.—1, M. Seamons, Aylesbury. 2, S. H. Stott. *DUCKS*.—*Aylesbury*.—1, M. Seamons. 2, J. Robinson. *Ducklings*.—1, E. Leech, Rochdale. 2, M. Seamons. *Rouen*.—1, T. Wakefield. 2, J. J. Waller. *Ducklings*.—1, J. J. Waller. 2, T. Wakefield. *Black*.—1, S. Burn. 2, J. Robinson. *Any other Variety*.—1, H. B. Smith. 2, S. H. Stott. *Ducklings*.—1, C. W. Brierley. 2, S. Burn. *TURKEYS*.—1 and 2, E. Leech.

CHICKENS.

DORRING.—*Grey*.—1, T. Briden. 2, J. Watts. *White*.—1 and 2, J. Robinson. *GAME*.—1, C. W. Brierley. 2, T. Wareing. *COCHINS*.—1 and 2, C. Sidgwick. *HAMBURGS*.—*Golden-pencilled*.—1, H. Beldou. 2, B. Bee. *Silver-pencilled*.—1, H. Beldou. 2, J. Robinson. *Golden-spangled*.—1 and 2, E. Brierley. *Silver-spangled*.—1, G. & J. Duckworth. 2, H. Beldou. *BANTAMS*.—1, H. Beldou. 2, B. Bee. *GEESE*.—1, E. Leech. 2, W. Brierley.

WHITBY POULTRY SHOW.

The following are the awards at this Show, held on the 11th inst.:

DORRING.—1, J. White, Warley. 2, G. Holmes, Driffield. *CHICKENS*.—1, J. White. 2, W. English, Pickering. *SPANISH*.—1, G. Holmes. 2, W. Elliott, Bishop Auckland. *CHICKENS*.—1, H. Beldou. 2, J. B. Stephenson. *GAME*.—*Black-breasted or other Reds*.—1, H. M. Julian, Hull. 2, T. Robson, Bishop Auckland. *Any other Variety*.—1, H. M. Julian. 2, J. Robson. *Duckworth*. *CHICKENS*.—1, T. Blackburn, jun., Broughton. 2, W. Sleightholm, Uxbridge. *COCHINS*.—1, J. Sichel, Chester. 2, J. Booth, Lythe. *C. G. Speedy*. *Whitby*. *CHICKENS*.—1, J. Dove, Northampton. 2, T. H. Readman, *hc*, G. Holmes, *c*, W. G. Purdon, Driffield. *BRAHMA POOTRA*.—1, E. Leech, Rochdale. 2, W. Whiteley, *hc*, E. Corney, Whitby; H. Beldou; W. Newton, Whitby. *CHICKENS*.—1, E. Leech. 2, J. Sichel, *hc*, W. Stonehouse. *FRENCH*.—1, H. Beldou. 2, J. J. Maillen (Creve-Cœur). *hc*, W. G. Purdon. *c*, T. Previval (Creve-Cœur). *HAMBURGS*.—*Golden-spangled*.—1, H. Beldou. 2, G. Holmes, *hc*, H. Pickles, jun., Enby; G. Garbutt, Sainsbury. *Silver-spangled*.—1, H. Pickles, jun. 2, H. Beldou. *hc*, G. Holmes. *Gold or Silver-spangled*.—1, H. Beldou. 2, H. Pickles, jun. *hc*, G. Holmes. *Gold or Silver-pencilled*.—1, G. Holmes. 2, H. Pickles, jun. *hc*, G. Holmes. *Gold or Silver-pencilled*.—1, H. Pickles, jun. 2, Rev. R. A. White, *hc*, J. Webster, *c*, H. Beldou. *Silver*. *GAME BANTAM*.—1, G. Holmes. 2, T. Blackburn, jun. 3, W. F. Edwistle, Cleckheaton. *BANTAM* (Any other variety).—1, H. Beldou. 2, T. Tinley, Whitby. *ANY OTHER VARIETY*.—1 and 2, H. Beldou. *Black*.—1, E. Leech. 2, T. Readman (Silver-pencilled). *Welburn (Java Fowls)*.—H. JUDGES.—Mr. James Dixon, Bradford; Mr. Harry Adams, Beverley.

STROUD POULTRY SHOW.

The meeting on the 10th, 11th, and 12th inst., was the first of the kind ever held in Stroud, and under the management of a most energetic Committee it was certainly one of the best first shows we ever met with. Saving a slight mistake in the classification of the Hamburgs in the prize schedule, the arrangements were as faultless as could have emanated from the most practised managers. The tent was as spacious and well ventilated; the pens the well-known ones of Mr. Billott, of Southampton; and in the matter of feeding, if error existed it was rather on the side of over-attention than of neglect. All this, coupled with the finest weather, brought together a host of visitors, and the success of the Show must have been very great.

Grey *Dorings* were especially good classes, but, as might be anticipated, mostly much out of condition. *Spanish* were in strong force, some of the best birds in the kingdom competing; and it is worthy of especial note Mr. E. Jones's cup pen was, even this late in the season, in point of condition equal to birds of early spring time. A remarkably good collection of *Cochins* was on view, and the good quality of the *Game* classes is equally worthy of record. Of *Hamburgs* the Spangled varieties took precedence in all cases, as by an oversight in the prize list they had to compete with the Pencilled breeds, the latter, as will be expected, showing just now in very faded feather. The *Game Bantam* class was perhaps the worst represented of any. *Aylesbury Ducks* were faultless, and in this class, as in *Geese*, Mr. Fowler, of Aylesbury, held undisputed sway. This gentleman's wonderfully well-shown pen of *Geese* took the victuallers' silver cup, being the prize of highest value in the schedule for the best pen of any variety of poultry exhibited. In the "Variety" Duck class *Buenos Ayrean*, shown by Mr. Saunders Sainsbury, took the first prize, and a pen of good *Carolina* the second position.

The *Pigeons* were well worthy of a close inspection. Carriers throughout were extraordinary, though many pens were badly matched

—viz., a really unexceptionable and a middling bird together. *Pouters* were as good as can be generally met with at our best shows, and to a remarkably good *Blue* pair of this variety the Pigeon silver cup was awarded.

DORRINGS (Any variety).—1 and Cup, J. Martin, Worcester. 2, F. Parlett, Great Baddow. 3 and *c*, L. Patten. *hc*, Rev. A. Kingscote; J. Lewry, Bolney Cockfield; M. Putney, Dorking; Hon. H. Wyllie; P. H. Jones; F. G. Phillips; G. Gregory. *c*, H. Yardley (2); C. Stephens, Eley; E. T. Dew, Weston-super-Mare; S. A. Wyllie; T. A. Dean (2); W. Stephens.

The Judges for poultry were the Rev. G. Hodson, of North Petheron, and Mr. Edward Hewitt, of Birmingham; and the Judge for Pigeons, Mr. Tegetmeier, of London.

THE HONEY SEASON, &c.

Your correspondent, "UTENHAEG," would be pleased to know the average of my hives, "all told." I can only tell him that I have in my home apiary fourteen stocks of Ligurians, and in another apiary, about two miles distant, I have eighteen other stocks; all with the exception of three, are in frame hives. The latter apiary consists principally of black or English bees. The bees in each apiary have been pretty freely experimented upon, for the purpose of making notes on or to refute certain statements lately put forth, the result of which will appear in another bee book at no distant period; and there is no question but this has been one of the most favourable seasons for my purpose. I have raised queens from Ligurian brood comb in eleven days, and worker brood has come forth in nineteen days from the eggs being deposited in the cells, and to-day I have examined a stock which has been thirteen days raising a queen. I saw her this morning running wildly over the cells; she was rather small, but well marked, and I shall anxiously watch her leaving the hive for her wedding trip, as I have done that of several other Ligurian queens which I have reared this season, and probably I may report the result.

It may be of interest to some of your readers to know that on May 21st I received a swarm of Ligurians, imported from their native Alps, which I at once transferred into a thirteen-frame hive. This swarm went to work in good earnest, and on July 11th had so far filled the whole of the frames as to induce me to form from it two artificial swarms. I did it thus—viz., I took four of the combs, which I put into a ten-frame hive, five of the combs (with the bees of course) I put into another hive of the same kind, and left the queen (I think one of the largest and finest queens I ever saw) "at home" with the four combs remaining, and on the 22nd of July each division or artificial colony had raised for itself a beautiful queen, which I have since found on examination to have proved fertile.

I cannot now give the average produce of my hives "all told," good and bad, having never weighed any, except the particular hive referred to in my previous communication, for I have found that experiments on my Ligurians in my home apiary have occupied so much of my time, that I have been

compelled to let my black bees take their chance until the end of September, at which time I hope to exchange the queens for pure imported Italians to reign in their stead.

I shall be interested to see the account of all "UITENHAGE'S" hives, good and bad, and I may state that most of the outside combs which I have taken already will bear comparison with those usually taken from "supers."

In reference to the Rev. G. Raynor's communication, I may just remark that I much question whether the queen is ever impregnated inside the hive, as my experience teaches me that impregnation always takes place outside the hive and "on the wing;" and I am also of opinion that the queen is generally impregnated prior to her leaving the hive with a swarm, in which case her progeny would not be affected by her being placed amongst an apiary of black bees.—SUDBURY.

[It is only first swarms that can be expected to remain pure, as these are usually, although not always, accompanied by the old queen. After-swarms have only virgin queens.]

COLONEL F. C. HASSARD, R.E.—The lovers of poultry will learn with regret that this gentleman has been ordered home, and will soon have reached England. Few who had any acquaintance with the Colonel will deny that to his individual efforts during his stay in Canada, especially in Toronto, is owing much of the improvement in the culture of pure-bred poultry which has recently become so visible in this country. As a poultry and Pigeon fancier he had in Canada no equal, while to his thorough acquaintance with the rules of English poultry clubs, and his superior knowledge of poultry, much of the recent improvement in poultry judging at our shows is to be attributed. With him originated the inception of a poultry club in Ontario. He communicated his views on the subject to a few fanciers, who sided him in the formation of a society, the benefits of which to poultry-breeders is a recognised fact.—(*Canadian Poultry Chronicle*.)

THE VINEGAR PLANT.

In answer to inquiries as to where this strange production may be purchased or procured, I may state that it is never offered for sale, but may be easily obtained by the following means. Leave a little vinegar in a small bottle to become stale (during hot close weather is best), till a film appears on the surface. This film is the spawn or mycelium of a species of mildew, and is the incipient state of the Vinegar Plant proper. If a few fragments of coarse brown sugar be now added it will somewhat aid its growth; but when the film has attained the thickness of parchment it is ready for transfer to syrup, where it soon becomes the housewife's normal Vinegar Plant.

Procure a large jar or bottle, and to two quarts of boiling water add half a pound of treacle and half a pound of the commonest brown sugar; stir well together, and when cool transfer the film from the surface of the vinegar to the surface of the syrup; cover up to exclude air, and keep in a warm cupboard. This film will now rapidly grow and form a thick, slippery, gelatinous mass all over the surface of the syrup, and in the course of six weeks or so the liquid will be changed to excellent vinegar. The Vinegar Plant can now be taken and divided into layers, or cut up into fragments, each piece of which, if placed upon fresh syrup, will rapidly grow and change the liquor into vinegar. The vinegar should be allowed to settle, and be strained before it is used.—W. G. S.

OUR LETTER BOX.

BOOKS (*John Chose*).—The "Poultry-Keeper's Manual," published at our office, is the best book on the subject, and can be forwarded free by post for 7s. 1 d. (*G. Lee*).—"My Bee Book," by the Rev. W. C. Cotton, is an interesting and instructive work, but the fact of its having been written nearly thirty years ago is sufficient to prove that it is not suited to the instruction of even a novice in the modern system of scientific bee-keeping.

CANKER IN PIGEONS (*Nonplussed*).—Diseases of the throat have this dry weather been wonderfully common, both with the human subject and with Pigeons, as if the very intense and lengthened dryness of the atmosphere acted as the reverse so frequently does. Try a strong solution of alum, applied with a feather twice a-day. Thirty years' experience in Pigeon-keeping convinces us that these birds will bear almost any amount of heat in their loft, but cannot bear any draught. Vary their food, giving peas now for a time.

ROUP IN PIGEONS (*W. M.*).—See what we have said above concerning heat and cold for Pigeons. Perhaps you ventilate overmuch, in other words, put the birds at night in a constant draught. Try a dose or two of charcoal powder, or a dose of carbonate of soda, or a pinch of alum; all these have been known to cure roup.

PIGEONS NOT BREEDING (*J. N. E.*).—Baldpated Trunblers are such ex-

cellent breeders, that, supposing your birds are of the opposite sexes, we can conceive no reason for their barrenness, except old age.

HIVING A SWARM OF BEES SETTLED IN A ROOF (*J. M.*).—You require skilled assistance to enable you to secure the swarm, which can only be done by opening the roof, and thus obtaining access to the space occupied by the bees.

BEE HIVES AT LISKEARD POULTRY SHOW.—Mr. W. J. Pettitt, of Dover, was awarded the silver medal for the best bee hive for cottagers' use at this show.

FRAME HIVES (*James Hall, Kedington*).—We have no knowledge of the hive to which you refer beyond what we can glean from the handbill, but we may confess to not being very favourably impressed with it. If you wish for a moveable comb hive we should recommend the one named after Mr. Woodbury.

OAK SILKWORM (—).—The following reply is from Dr. Wallace, of Colchester:—"The culture of the Yama Mai (Japan Oak) Silkworm in this country is not yet successfully introduced. Many have failed in Great Britain and Europe; nevertheless, there are several exceptions. In 1869, a German Baron obtained 37,000 cocoons, and others have likewise succeeded in various parts of the Continent. In England several gentlemen have reared this insect, more especially in the western and midland districts; but in the southern and eastern districts nearly all attempts have failed. I believe the cause of failure to be the exposure of the caterpillar to too dry an atmosphere. In a cool moist climate success has been obtained. I know of at least one hundred cocoons this year raised by three individuals. Correspondents in Japan have promised to send me full details of the mode they practised of rearing this valuable insect, and also some particulars of the climatal influences. Bombyx Mori culture on light soils and in such seasons as the present is highly successful in our southern and eastern districts."

METEOROLOGICAL OBSERVATIONS

COVENT GARDEN MARKET.—AUGUST 17.

THE markets have been less active during the week, and the demand in the provinces has also slackened as they become supplied from their own localities, so that a reduction in prices has taken place. Hothouse produce is more than sufficient for the trade. Peaches and Nectarines of good quality are being offered from the open walls, and range from 3s. to 6s. per dozen. Plums of all descriptions are very abundant. In the Potato trade in all its branches a fair amount of business is done.

From observations taken near London during the last forty-three years, the average day temperature of the week is 72.8°, and its night temperature 48.6°. The greatest heat was 89°, on the 25th, 1859; and the lowest cold 31°, on the 9th, 1861. The greatest fall of rain was 1.92 inch.

AMONGST MR. LAXTON'S PEAS.

FROM London the Great Northern Railway takes us to Stamford, or ought to have done so if the great lord of Burghley had not willed it otherwise. Now it leaves us at Essendine, a few miles distant, and from thence we are the passengers of the Most Noble the Marquis of Exeter. Stamford was a busy place in the old coaching days, and is now a very interesting one, celebrated for its churches and bells. Stamford might have been what

Peterborough now is—a brisk and busy centre of railway communication, had not the lord of the soil prevented the passing of the great railway near his portals. As it is, Stamford stands still; Stamford wants brushing up. It was not, however, to see the town that I went there, but the greatest man in Stamford, horticulturally speaking—Mr. Laxton, well known as a great horticulturist, as a successful introducer of new Peas—Peas, too, of a most wonderful character.

What an advance amongst our Peas during the last ten or twelve years! Our Pea lists, no doubt, are too long already, and if we are to believe all that is said of them, they possess all the requirements wanted, and are every year becoming earlier and superior. The greater portion, however, of these so-called new varieties are merely selections—selections it may be—magnificent improvements on the original, and consequently valuable. New Peas, however—Peas raised by careful cross-breeding—come only to us from the hands of a very select few. The first great Pea cross-breeder was Thomas Andrew Knight, for a long time President of the Horticultural Society, who raised for us many fine sorts remarkable for their thin skins and delicate flavour, not yet equalled; I allude to Knight's Tall and Dwarf White and Green Marrows, &c. Then came the late Dr. McLean, of Colchester, who gave us dwarf and early Marrows, such as Little Gem, Advancer, Premier, &c., of wonderful value. Next, or now, we have Mr. Laxton, who, although he has already done much, will yet do more. He is at present almost our only Pea cross-breeder. There are not many, it is true, who could give the time; there are but few who would have the patience, or the knowledge either. There is no greater enthusiast. And what an enthusiasm one must have for this sort of labour!

No one who has not attempted it can have the least conception of the time or labour that is involved in making a single cross amongst Peas. It may seem most incredible, it is nevertheless the fact, that from a single cross, the crossing of a single flower, some four or five hundred distinct varieties may be procured ere any one form is fixed or fit for sending out, which takes up a period of from five to seven years—that is, from the time of the crossing of the flower.

In the hybridised pod there may be eight peas; each of these when sown will produce from eight to ten pods containing each eight or ten peas—a total of more than five hundred peas the first season. These, according as the cross

may have been, may be either very similar or dissimilar. Mr. Laxton showed me some pods, the produce of a cross between the old Maple Purple and a white Pea, in which every pea was dissimilar—some round, smooth, white; some white, wrinkled; others blue, grey, mottled, brown, green, &c., not any two peas alike. All of these have to be grown distinctly, gathered separately, and again sown, or else discarded, if considered unworthy. These again will sport the following season as before, and more or less for some time. After a time, however, by great care in the selection of the dried seed in winter and "roguing" in summer, they leave off these vagaries, and become what is called "fixed," and fit to send out to the public.

Some new Peas have been sent out too soon—such as Laxton's Prolific Longpod, and this accounts for its mixed character, one portion of the sample being green, and the other white, the true variety, according to Mr. Laxton, being the white one. The condition of this Pea before the public is not due to Mr. Laxton, but to the vendors who had it from Mr. Laxton as an unfixed variety. It will thus be seen that the raising of new Peas and their introduction to our gardens are a most laborious affair, requiring the utmost patience, zeal, and perseverance, and also a considerable outlay, the recompense therefrom being little commensurate with the actual cost, excepting in the gratification of indirectly benefiting mankind.

One of Mr. Laxton's greatest triumphs as yet before the public is, no doubt, *Laxton's Supreme*. The pods of this are very large and extremely handsome. It belongs, however, to a class which is more remarkable for good looks than fine quality. With Mr. Laxton this Pea was not over-grand, whilst with Mr. Gilbert, at Burghley, it was superb. There are other two varieties as large and nearly as handsome as this yet to come out—viz., *Laxton's Quality*, a wrinkled Marrow, and *Laxton's Quantity*, a selection from it. Here we have a line of the green variety of Laxton's Prolific Longpod, a very excellent Pea, and side by side another—Carter's Hundredfold, said to be a cross-bred kind. They are, however, identical, as Mr. Gilbert, an experienced gardener, testifies.

I must just remember *Alpha*, the first step towards long podded early wrinkled Marrows, and a very fine Pea. This is now to be superseded by *William the First* as an earlier still, more wrinkled, and better sort. This is one of the most important introductions in the Pea line which will be amongst us next season, and will completely drive away such tasteless stuff as Ringleaders and First Crops.

I am afraid to speak of the many varieties Mr. Laxton has here, and of such high promise. One batch were from crosses between Ne Plus Ultra and Veitch's Perfection. Most of these were about 3 feet in height, earlier than Veitch's, with pods more nearly resembling Ne Plus Ultra. Then another lot of dwarfs, over one hundred in number, in little short lines, crosses from Little Gem, &c. Here was Little Gem itself as a test sort. All the seedlings were much of the same habit, many were earlier, others larger in pod, &c., some white, wrinkled, some blue, wrinkled. From these I expect something good. This is the style of Pea for general use. Here is another lot

between Alpha and Little Gem, and Ringleader and Little Gem, all showing marks of distinction and promise of merit. From some of these comes a deep green, early, wrinkled Marrow, a wrinkled Pea as early as Saugeter's No. 1, and as green as possible. This is a decided novelty and a great gain.

We have, again, some curious results from crosses of the old purple-flowered Maple Pea, the purple blood of which seems to drive the white Peas mad; they run into all colours, being white, brown, green, freckled, and speckled; something interesting Mr. Laxton will no doubt secure. Again, there are numerous crosses from the Sugar Peas, those of which the pods are eaten like Kidney Beans. What may come out of these one can hardly tell—enormous podders, no doubt. Lastly, and I found them growing at the farthest-off side of Mr. Laxton's garden, were, perhaps, the finest lot of Peas the world has ever seen; they were superior in size and appearance to Laxton's Supreme. I measured one pod which was quite 6 inches in length, full of large peas, and remarkably handsome. This was the last. I cared for no more.—ARCHAMBAUD.

THE GLADIOLUS AT SOUTH KENSINGTON.

THE general details of the Show having been already given in last week's Journal, I am left the more free to enter upon that part of the subject which is more especially grateful to me—not the comparative merits of the different exhibitions, but the value of the different flowers. One or two words, however, I must say. The Exhibition amply bore out what I have ever stated—that if you give real encouragement to a flower you will soon induce people to grow and exhibit it, and the value of such exhibitions no one can tell. If a few prizes of a pound a-piece had been offered, would they have brought men from Kelso, Darnbarrow, Taunton, Edinburgh, &c.? Should we have heard, as we did, the broad Doric Scotch on all sides of us? I am only sorry that we did not also hear the rich unctuous brogue of Cork and Dublin. Perhaps another year we may be so favoured. And assuredly our thanks are due to the Rev. Joshua Dix for having originated and carried out this scheme. Its success will, let us hope, induce him to try it again. I may just as well say, to show the value of such shows, that two of my acquaintances were so delighted with the flowers that they at once determined to grow them, and will purchase a selection of sorts—one of them, at any rate, to exhibit.

It is quite clear that the last two or three years have materially altered and improved the Gladiolus. Varieties that we then thought excellent will bear no comparison with those of later date. The flowers individually are larger, the tendency to be "winged" is less, and a larger number of flowers are opened together. Who, for example, would care to grow *Rose Victoria* when he can grow *Madame Desportes*, or *Napoléon III.* when he can have *Horace*? and hence a great change is seen in the character of the stands. Of the flowers, then, of last year—that is, sent out in the autumn of 1868, the following were shown in fine condition:—

Homère.—A long spike. A sort of light purple flamed with brilliant magenta.

Madame Desportes.—A magnificent bloom of this graced Mr. Kelway's stand. It was of the purest ivory white, with a violet feather in the lower petals.

Madame Dombroin.—Dwarf plant, but vigorous; well-arranged spike, somewhat in the style of *Homère*, but distinct.

Marie Stuart.—A very beautiful blush flower, tinted with rose and flamed with carmine. A most beautiful flower.

Michel Ange.—A very remarkable variety; long spike, dark purplish crimson, light centre, and the flower very curiously displayed—more like a Lily than a Gladiolus. I fear it is delicate in habit.

Monsieur Legouré.—A splendid fiery red, the petals with a white line on them; a grand flower. Vigorous plant.

Racine.—A magnificent spike of this was in Messrs. Stuart and Meis's stand from Kelso. A fine cherry colour stained with violet.

Schiller.—A pale primrose flower, large carmine spots, very handsome.

Agnes is too pointed, *Fœclen* and *Thomas M.* given have the flowers too far apart, *Romulus* is too loose, *Virgile* fine in colour, but somewhat starchy.

The eight above mentioned were all fine, and all shown in good condition.

With regard to the flowers of 1870—that is, those let out

last autumn, the following were shown well, and are worthy of a place in any collection:—

Armide.—A grand spike of this was exhibited by Stuart and Meis. It is a white ground tinted with carmine.

Agathé.—Fine spike of large flowers; light ground tinted with orange.

Delicatissima.—A beautiful light, delicate violet flower, well deserving its name.

De Humboldt.—Cherry red tinted with purple, somewhat of the colour of *Michel Ange*.

Horace.—Red with white spots, of the same style as *Napoléon III.*, but greatly improved.

Orphée.—A magnificent spike of this was in my own stand; it is a fine flower, rose ground flamed with carmine.

Robert Fortune.—Carmine-flamed, crimson centre.

Rosa Bonheur.—White, with a deep violet carmine spot. It has a peculiarity of doubling back the top petal, which a little detracts from its beauty.

Rosa Perfecta.—Rose-tinted violet, each petal marked with white.

There are others yet to be decided on, such as *Bijou*, *Livingstone*, *Elizabeth*, *La Candeur*, *Pericles*, *Spectabilis*, *Sylphide*, and *Sultane*, about which I may have to say more by-and-by.—D., Deal.

THE STRAWBERRY SEASON OF 1870.

I CONSIDER a dry season the best for Strawberries; it causes no diminution in the quantity of the produce, and the quality is vastly improved. Of course abundant supplies of water must be administered. Take, for instance, that fine but peculiar Strawberry *Dr. Hogg*; in a wet season it is very indifferent, but in a season like the present it has been unsurpassed.

The rainfall for the first six months of the year was not much more than half the usual quantity. In January we had 1.59 inch, in February 0.22 inch, in March 1.76 inch, in April 0.40 inch, in May 0.56 inch, in June 0.15 inch; in all 4.98 inches. Excepting by well-watered plants no runners were formed. The superiority of young plants was easily determined this year; the value of deep cultivation and high manuring equally so. For pot culture *Black Prince* is still grown as the earliest variety; it is a sure bearer, and always colours well. For the second crop *Premier* was grown this year, succeeded by *President*. *Premier* is not first-rate as regards flavour, but is a most robust grower, and bears an immense crop of large fruit of a bright dark red colour. *President* is one of the best both for pot culture and out of doors. For late bearing *British Queen*, *La Constante*, *Mr. Radclyffe*, and *Frogmore Late Pine* are most esteemed. *Dr. Hogg* is generally very deficient in colour when grown in pots under glass, although the fruit are of the largest size of any. *La Constante* is a great favourite; it is not to be compared with *British Queen* or *President* for flavour; the flesh is very firm, and it is the best variety to keep after it is ripe. The fruit is of a brilliant crimson.

The main point in successful cultivation is to have the runners layered early, and let the plants experience no check to their growth afterwards. The pots ought to stand on a hard bottom, and means should be taken to prevent the ingress of worms through the holes. I set each pot singly on a brick; the plants are by this method more fully exposed to the sun and air, and worms are effectually excluded. If bricks cannot be obtained the next best method is to form a bed of coal ashes, heat it hard, and make it perfectly level with a rake. Out of about 250 grown in the orchard house there were not more than two or three barren plants; two or three more were turned out because of weak or badly formed trusses.

Lucas and *Sauveur de Koff* I limited for the first time this year. They are both good. *Lucas* is the stronger grower and superior to the other. I think it will displace *La Constante*. I cannot concur in Mr. Glöck's estimate of *Sir Joseph Paxton*; it sometimes does well, but is uncertain and very much subject to mildew; for the last-named reason alone I have discarded it. Mr. Webb's estimate in the same page (99), is also very different from mine. The reason must be the difference in soil and climate. *Lucas*, *President*, *La Constante*, and *British Queen* he depends. I consider them four of the very best sorts in cultivation, and grow them largely both in pots, and out of doors. The soil here is of a light sandy nature, and not far from the gravel. I have planted sixteen varieties this year, and the best six of them as grown here are *President*, *Lucas*, *La Constante*, *Mr. Radclyffe*, *British Queen*, and *Frogmore Late Pine*. *British Queen* might be omitted, as it is not sufficiently

distinct from Mr. Radclyffe, and Premier substituted, as it comes in before President.—J. DOUGLAS.

DOUBLE GERANIUMS, AND WHAT THEY MAY BE.

AMONG the plants to which the present dry season has been favourable may be ranked the double-flowered Geraniums, which have gained friends where before they were merely tolerated as novelties. They have flowered well this season, and most likely there will be an increased demand for them next year. I fully expect in a very few years they will take a higher position in the flower garden than their most ardent admirers ever dreamt of, when varieties are produced possessing the necessary qualifications for an out-door plant, which those we now have scarcely do. Their well-doing this year is, I think, due to the exceptional character of the season, but I hardly expect the same success in future; for, as I write on August 10th, it is only reasonable to look for a greater amount of moisture during the remainder of the summer than we have yet had; and with that I expect the evils of former years will reveal themselves in the double Geranium; those evils being a gross leafy growth, with few flowers, and these apt to decay before making any show. Even the long dreary nights will accomplish this in a measure, whether there be rain or not.

I think with varieties having a greater disposition to flower than those we now have, and possessing some other properties which I shall notice, we may expect greater success than we have yet had. I venture to predict for the double-flowered Geraniums a more extended area of usefulness than the Tricolors are likely to have, and this is saying much in the face of the class in whose honour special prizes, nay special shows, have been given; but great favourites are not always lasting friends, and I expect half a dozen years hence double Geraniums will be more extensively cultivated than these sickly fashionables of the present day. As double flowers, in general, retain their individual beauty longer than single ones—for instance, the double Cherry, Peach, Stock, Rocket, and others—there is no reason why the Geranium should not do so also. The principal defect seems to be a disposition on the part of the centre of each truss of flowers to decay before we would like it to do so, and no doubt it is owing to the absence of rain, and very often dew, during the present season, that has preserved the flowers longer than usual. As there is no limit to improvement in flower culture, there is reason to hope we may hereafter be favoured with varieties capable of withstanding the destructive influence of moisture. Witness what was done with the Pansy many years ago; its thin flimsy petals were taught to assume a stiff, leathery substance, and to stand up unscathed against the fierce sun of midsummer; may not the Geranium also be brought to resist decay when it comes in the shape of moisture rather than lack of vitality? To accomplish this, however, I believe we must abandon some of the points insisted on by what may be called the red-tape class of florists. The code of laws they have laid down for the guidance of cultivators of this and other florists' flowers must be disregarded, and the compact truss or head of bloom so much insisted on ought to be transformed into a rather loose one. The individual flowers should be sufficiently far apart to let the air circulate freely amongst them, and, consequently, enable the blooms to shake off the moisture much sooner than they do now, and most likely a prolonged blooming period will be the result, especially if in addition to the quality referred to the plant also possesses a disposition to flower as abundantly as some of the single ones now do. I merely throw out these hints, thinking they may be of service to those who may be experimenting, and if in the course of their experience they produce a good double flower that is set somewhat loosely upon its stem, they should not throw it away until after a trial out of doors, and perhaps it may turn out better than some conforming more closely to the present standard.

As I have not been at many horticultural shows this season, I may not have seen the last new varieties of this section of Geraniums, but I hardly think those who supply the public with such flowers would venture to present them with a loose, open-headed one like that I have been describing as likely to be useful for out-door purposes. Variety is certainly wanting in another direction. Good whites, and other light-coloured kinds seem to be scarce, and yet they are as desirable as scarlets. Time, however, I have no doubt, will supply us with all these kinds; and with such good flowers as Wilhelm Pfizer, Marie

and Madame Lemoine, Andrew Henderson, Triomphe, and others, to begin with, flower-garden requirements will probably be met. By-and-by, when our Mrs. Pollock, Lady Cullinm, and others have to retire to the drawing-room, our flower beds may come out in all their glory with double Geraniums in sufficient variety to enable everyone to have his button-hole supplied with one.—J. ROSSON.

THE ONION CROP.

IN December last I trenched a piece of ground 25 yards square, to the depth of 2 feet, just deep enough to bring 3 inches of clay to the surface. After it had remained in a rough state for six weeks I forked in a good quantity of strong manure—principally refuse from the garden—and on the 10th of March sowed the seed in drills 18 inches apart. One half of the ground I sowed with the Nureham Park, the seeds of my own sowing; the other half I sowed with Danvers' Yellow and Giant Race.

To-day (August 15th), I have measured some bulbs of the Nureham Park, and I find that they are fully 13 inches in circumference. The largest of Giant Race are 11 inches in circumference, and Danvers' Yellow 10 inches. They have not had a drop of water except that which has fallen from the clouds, and we have only had very little here.—A. DONALDSON, *Latimers*.

ARAUCARIA IMBRICATA AT BICTON.

IT may be interesting to your readers to hear something about the Araucarias at Bicton in the present year. From two trees in the Araucaria avenue we have already gathered upwards of five hundred perfect seeds, a specimen of which is enclosed, and from several other trees, on which the cones are not yet ripe, we may safely calculate on securing at least five hundred more. The cones from which the produce here stated was taken averaged fifty perfect seeds to each; it may therefore be inferred that the Araucaria, when it arrives at maturity, will be a most productive tree.

There are in the nursery here only thirty plants averaging 1 foot in height which have been raised from seeds ripened at Bicton; and three others that were some years since planted in the pinetum average 1 foot 6 inches high. From the above data it is presumed that the Araucarias at Bicton have produced very few seeds in former years.

When writing on this subject it may be worth recording that the last year's seeds of Picea Nordmanniana, P. Pinusapo, P. amabilis, and many other good species have germinated very freely here this season; it is therefore hoped that those to whom my noble employer requested me to send a supply have been equally successful.—R. BRADY, *Bicton Garden*.

The seed sent was very fine, plump, and perfect.—Eds.]

PEA CULTURE.

I AM interested in Mr. Luchhurst's suggestion for protecting early Peas, at page 77; but would not the same end be answered, and the trouble of making the boxes be saved, by adopting for the first the plan he recommends for the subsequent growths?—say, by dusting the seed well with red lead, sowing as deeply as is consistent with good practice, sowing thickly, and then putting on the glass—laying it on the ground I mean. I assume that, apart from the red lead, mice do not mind seed when germinated, and although sparrows will take off the young tops, if the plants come up thickly they will not take all. Would it not be useful to mingle plenty of blacksmiths' ashes in the drills before sowing? The sharp ashes from the forge must tend to keep off slugs, &c.—H. VENTNOR.

CALIFORNIAN CONIFERS.

MR. HOBBS, in his excellent description of the Pines of California (pages 80 and 81), confounds Abies with Picea. The Abies has hanging cones with persistent scales. The Picea (amabilis and grandis) has upright cones with deciduous scales, and, as he justly remarks, the leaves bear two rows; they have likewise two white lines on their under side. This is a distinction which gardeners seldom notice, and it makes it very puzzling to botanists and those ordering of trees. It is not to be found in Bentham or an English flora, as the country does not furnish either specimen; but the whole family are excellently dis-

tinguished in Loudon's "Arboretum et Fruticetum," a work which is still to be had at old bookstalls; I bought mine at one, and it is well worth the small price the two volumes can now be had for. If it were better known, our gardeners' lieta would be greatly improved, and better understood by accurate students, who are their best friends.—B. H. W.

GARDENING IN THE LONDON PARKS.—No. 1. BATTERSEA PARK.

THE modern style of flower gardening has probably done more than anything else to draw the attention of the gardening world to the importance of a knowledge of the relative value of colours, and to the cultivation of correct taste in the arrangement of them. Like the painter or sculptor, we strive to obtain a sight of the works of masters in the art, not altogether with the view of closely imitating what we see, but rather to endeavour to grasp the intention of the artist, to see what his aim has been, to study the general effect of the whole, and so render the lesson useful to ourselves by applying its soundest principles in our future practice.

It was with some such thoughts as these that I went to see the flowers at Battersea Park, Hyde Park, and the Crystal Palace, and it is my purpose in these notes to give some description of what I saw at each place, with the hope that it may prove useful and interesting to those who are prevented by distance and other causes from seeing and judging for themselves.

Taking them in the order in which they are named, Battersea Park worthily occupies the first place, not simply because the tropical plants are its chief feature, but because at Battersea one sees evidence of great skill and ability in the singularly appropriate manner in which the grounds have been adapted for their intended purpose. The winding walks, the gently sloping banks, the abrupt eminences, the sheltered nooke, and the pleasant glimpses of water, all contribute to the formation of such a scene of beauty as is rarely to be met with; and at this season, when to all these fine permanent features are added the host of fine-foliaged plants from the tropics, which, by the skill devoted to their arrangement, display their curious growth and foliage to the greatest advantage, these gardens may be said to be quite unique, so skilfully has the Superintendent availed himself of the rich variety which the graceful forms and varied hues of the tropical plants afford—the novel effects succeeding each other so constantly that the interest excited by the first glimpse is fully sustained in every part of the subtropical garden.

In designing these grounds the aim of the artist was evidently to obtain as much shelter as possible, in order to screen the large foliage of the tropical plants, which soon loses its beauty if at all exposed to violent winds; this shelter is obtained by causing the walks to wind about in graceful curves, so as to form a number of semicircular spaces, behind which rise banks well clothed with a variety of trees and shrubs, the growth of which, while it is void of all stiffness or formality, is kept beautifully graduated downwards till it meets that of the plants it is designed to protect. As an example of how well this is done, I will instance one group of beds occupying the space in front of a long sweeping curve. Towards the highest part of the bank is a broad belt of Lilacs, next below this is a row of variegated *Aucuba japonica*, then a fine bold line of the dark-flowered *Nosegay Pelargonium Waltham Seedling*, next this a row of *Golden Pyrethrum*, with a front row of *Stachys lanata*. Close in front of this bank, at the centre and deepest part of the curve, is a fine long bed having lines of *Canna discolor* behind, then *Canna expansa rubra* of lower growth and with dark-coloured foliage, and a row of *Pelargonium Golden Fleece* in front. This bed has a very bold and striking appearance. In front of it, near the walk, are three circular beds, the middle one containing in its centre a splendid *Cycas revoluta*, with its elegant fronds spreading gracefully over a mass of *Coleus Albert Victor* beneath, while around the *Cycas*, but not near enough to crowd it or affect its beauty, were smaller plants of *Latania borbonica* and *Chamserops Martiana*, with an edging of the pretty grey *Santolina lavandulifolia*, which gave an appropriate finish to the whole. Of the other two beds, one contained a compact mass of *Lilium lancifolium rubrum*, and the other a crimson scarlet *Pelargonium*; both beds had edgings of *Centaurea gymnocarpa*. A few Palms springing from the turf among the beds imparted grace and lightness to the entire group, which is but one among many others equally striking and effective.

Another very long graceful curve, having, like the rest, its sloping bank of shrubs, had all round the curve at the base of the bank, but raised 2 or 3 feet from the actual level, a number of small semicircles cut into the bank, on each of which was enthroned a noble *Musa Ensete*, surrounded by other tropical plants. On the level surface of the turf, at the foot of the bank, were some fine groups of *Cannas* and various other fine-foliaged plants, interspersed with good specimens of *Scaevola elegans*, *Cordyline indivisa*, a fine *Latania borbonica*, and a beautiful plant of *Areca sapida*. In front of this group, on the turf beyond the walk, were a number of beds, some containing varieties of *Cannas*, and all interspersed with handsome specimens of *Palma*. A novel effect was here produced by a long narrow bed, the curves of which were so close to each other as to form a number of small semicircles, each of which embraced a neat circle of green Ivy; the sides of the bed were faced with a thick compact hedge of *Euonymus radicans variegatus* nearly a foot high; the soil of the bed was almost level with the top of this hedge. A broad line of *Pelargonium Cybister* ran along the centre of the bed, with a row of *Pelargonium Golden Fleece* on each side. This bold mass of colour lost all its harshness by the proximity of so much green foliage.

At another part of the garden is a fine group of *Acer Negundo variegatum*, occupying an elevated and commanding position in front of a belt of dark-foliaged shrubs. Passing round one of the numerous curves one cannot fail to admire the fine effect produced by this mass of silvery foliage, which is so placed that a walk leads straight to its centre, where the tallest plants are placed, the whole group being so arranged as to elope gently downwards from its centre to the outer row. A short distance from this group a striking contrast presents itself in a number of *Yuccas* clothing a steep bank.

A fine effect, different in character, and certainly as novel in design as any group to be found in the entire garden, is produced by four beds on the turf, in a line parallel to the walk; two of these beds are parallelograms, and two are circles; all of them are planted with the same kind of plants, but with the colours arranged in different designs. The soil of these beds, in common with that of most others here, rises abruptly from the turf, and thus a miniature ramp having a sharp slope is formed all round the beds. On the face of all the beds is a neat row of *Echeveria secunda glauca*, and in each of the long beds a band of *Alternanthera paronychioides* runs all round next the *Echeveria*. Along the centre of each bed are three separate small scrolls of *Golden Pyrethrum*, with a small star of *Santolina incana* on each side of the central scroll. Closely surrounding these, and entirely covering the remaining surface of the beds, is a compact mass of the splendid *Alternanthera amœna*, with foliage of a deep pink or crimson shade. In the circles a band of *Alternanthera amœna* is outside next the *Echeveria*, then comes a band of *Santolina*, then *A. amœna* again, then *Golden Pyrethrum*, then more of *A. amœna*, with centres of *Santolina*, the *Pyrethrum* forming a number of vandykes, the spaces of which are filled on each side by the colours given above. Behind these charming beds are two masses of *Cannas*, with an edging of the dull grey *Veronica incana*, the quiet tone of which acts as a capital foil to the bright colours in the front beds. I have described this group fully, because the plants themselves, and the pretty designs into which their colours are interwoven, are such as are suitable for any flower garden however small.

Passing from this bright scene round one or two curves we come upon another equally striking, and far more uncommon—the miniature Alps, with their summits clothed with *Antennaria tomentosa*, which really conveys a very good idea of the perpetual snow it is intended to represent. From the "snow line" downwards to the ravine and lower slopes of the "mountains" are a host of alpine plants, the majority of which are of such diminutive growth that the plants of *Echeveria metallica*, which are interspersed among them, tower above them like giants. The quaint forms and the dwarf, compact growth of this rich collection of alpine plants offer an interesting study of a class of plants but too little known; the agreeable and natural manner in which they are here seen growing, and the novel effect of the whole scene, are also well calculated to fix the visitor's attention.

Turn we now to a very different scene, but quite as effective in its way, at another part of the garden, in a quiet nook, shut in and overshadowed by the spreading branches of trees. On one side of the walk is a group of *Tree Ferns*, so disposed as to exhibit the full beauty of their graceful proportions, and on the other side a narrow glade stretches away till it is lost among

the trees. All along the sides of this glade are Tree Ferns, their graceful fronds almost touching each other, and spreading out over other kinds of more lowly growth, forming a charming vista full of quiet beauty and repose.

Having thus given a sketch of some of the most striking scenes with which these gardens abound, I will now proceed to describe a few of the principal beds, most of which occupy raised spaces on the banks by the sides of the walks. A good effect was produced by a broad band of *Canna Rendatleri*, with abundance of its orange-coloured flower spikes; in front of this was a row of *Solanum laciniatum*, with deeply serrated foliage and pale blue flowers, and outside, an edging of *Amaranthus melancholicus ruber*. Another bed had a band of *Canna limbata*, with pale green foliage; in front of this was *Canna zebrina coccinea*, of medium height, with bronze foliage, having a handsome edging of *Santolina lavandulifolia*. A bold mass of *Wigandia caracasana*, with broad deep green leaves, had a fine effect, somewhat spoilt, however, by the rough and unsightly stakes supporting the plants. Another interesting bed contained the curious *Solanum pyracanthum*, with narrow foliage deeply serrated, having a number of spines or thorns of a bright orange colour on the stems and the upper sides of the leaves. In front of these were some plants of *Amaranthus tricolor*, with the rich leaf-markings beautifully developed. A long border contained *Canna limbata* and the fine *Canna Bihorelli*, with a good edging of *Scarlet Pelargonium*; another had two rows of *Canna purpurea spectabilis*, a fine variety, with deep bronze foliage. In front of this was a row of *Canna Sellowii*, a dwarf kind with green foliage; the edging was *Pelargonium Golden Fleece*. A mass of *Canna zebrina coccinea* was surrounded by a row of *Pelargonium Dr. Lindley*, with an edging of *Statice* in fine flower; this bed would have been better without the *Pelargonium*. In another bed was a fine, bold mass of foliage, consisting of *Canna limbata*, with *Ricinus purpureus*, and with an edging of *Funkia subcordata*. A circular bed of *Coleus Berkeleyi*, interspersed with *Abutilon Thompsoni*, had a very novel effect. In another bed was *Solanum macrophyllum*, with *Solanum marginatum* next it, then a row of alternate plants of *Amaranthus melancholicus ruber* and *Golden Chain Pelargonium*, with an edging of *Sempervivum montanum*. A fine effect was obtained in a circular bed by planting the centre with *Coleus Prince Arthur*, out of which sprang a few small *Musas*; round this was a row of pink-flowered *Lantanas* (*Delicatissima*, I think), with an edging of dwarf *Ageratum*. Another bed had a central mass of *Coleus nigricans*, out of which sprang a number of *Abutilon Thompsoni*; round this was a handsome line of *Pelargonium Daybreak*, a very fine variegated kind, the foliage having a broad silvery margin, and next this was an edging of the bright crimson *Alternanthera amœna*. This was a very handsome and attractive bed. Some of the beds were bordered with a broad line of a gold-blotched *Ivy* (*Hedera Helix aureo-maculata*, I think), which looked well. Many of the variegated *Ivies* are very valuable for this purpose. A small circle had a pretty design, formed of *Alternanthera apathulata*, *Golden Pyrethrum*, *Blue Lobelia*, and *Santolina incana*. Nor must I omit some good groups of *Ficus elastica*, conspicuous by their glossy green leaves and long, crimson, taper buds.

From other groups I may select *Polymnia grandis*, *Arundo Donax variegata*, *Canna metallica* with very dark rich foliage, and *Canna expansa*, a dwarf kind with bronze foliage, as plants possessing distinct and striking features. One or two lines of *Artemisia Stelleriana* had a very dull and ragged appearance, and it was to be regretted that so paltry a plant, without one good quality to recommend it, should find a place among so many plants of sterling merit. Some lines, too, of *Plumbago capensis*, though not so objectionable, were somewhat ragged in appearance, and had a very scanty crop of flowers. It must, however, be acknowledged that in the entire garden there was little, if anything, to cause one to indulge in a "growl;" on the contrary, the very high degree of skill exhibited in the selection, arrangement, and culture of the plants, their health, vigour, and uniform excellence, and the neatness and order which everywhere prevailed, all formed cause for hearty congratulation to all concerned.

I must not conclude this notice without referring to the numerous healthy examples of *Palms* and other fine-foliaged plants interspersed among the beds. The kinds most worthy of note were—*Phoenix reclinata*, *Chamærops Fortunei*, some fine plants of the elegant *Cordylina indivisa*, *Scaevola elegans*, *Ferdinanda eminens*, *Areca sapida*, and our old friend *Chamærops humilis*, a fine *Musa superba*, and nobler than all

the rest, the splendid *Musa Ensete*, the Abyssinian *Banana*. The largest plant of this was probably 12 feet high; one enormous leaf springing erect from its centre was perfect, but most of the other leaves had apparently been lacerated by wind. This stately denizen of the tropics has its stem sheathed in the bases of the leaves, which spring upwards and outwards, often being 10 or 12 feet long. Though attaining such noble dimensions the texture of the leaf is of exquisite delicacy; the bright red midrib, standing out boldly from the under surface of the leaf, contrasts most beautifully with its lively green colour. Beautiful as the plant is at Battersea this summer, it must be seen growing under the shelter of glass to be fully appreciated, for there its huge foliage acquires a delicacy of appearance far surpassing that which it presents in the open air. The fine plant growing in the Crystal Palace is well worthy of inspection.

The able manner in which all formality is avoided in the gardens at Battersea is an important consideration, for sure I am that a much greater degree of enjoyment must be derived from pleasure grounds so beautifully diversified, and offering such a charming contrast to the flat monotonous style which has hitherto obtained an almost universal adoption than from the latter; but this is a subject which to my mind is far too important to be dealt with here, and I therefore propose at some future time to devote a paper specially to it.—EDWARD LOCKHURST, *Egerton House Gardens, Kent*.

BEEET FOR DECORATIVE PURPOSES.

Or the many subjects that within the past few years have been pressed into the service of the flower gardener, there is none which seems to me so much out of place and character as Beet. Look at it as we may, intermix it as we choose—whether in the front or at the back of a border, near to the eye or distant from it—the impression given by the dark bronzy purple foliage of *Dell's Crimson* is that of a kitchen garden, whilst the *Chilian Beet* reminds me of a field of *Mangolds*. Flowers in a kitchen garden may be tolerated, they are there for a purpose—to afford cut flowers; but for vegetables in a flower garden there can be no such excuse so long as suitable plants having no culinary use can be found. But are there no plants so good as Beet? I imagine there are, and better subjects for a flower garden.

Dell's Crimson Beet is the most compact and close-growing, and it has the property of keeping well furnished at the base, the root being hidden by the dense leaf-growth even in a front line. The foliage is *Dracæna*-like, arches over from the centre, and its colour is very uniform. Individual plants hardly vary in this respect, but present a dark bronzed purple, a hue that may well be termed metallic. They are very regular in growth and size, and there are no "runners"; indeed it is by far the best variety I have seen. Of its value as a decorative plant there can be no question. It is much bolder, has more of an oriental aspect than any of the *Iresines*, *Amaranthuses*, or *Alternantheras*, and may be used with or without them. Unlike them, however, it is hardy, does not require to be reared in pots, and takes up no time nor house room. It may lie in the seed-closet until April, and then be sown where it is to do its duty. Besides, it comes in for the table quite as well as Beet grown in the kitchen garden. It will grow in cold localities where *Iresine*, *Amaranthus*, and *Coleus* do not succeed, and it is equally at home in a wet cold summer as in one like the present. It is just the plant for places where a mass or lines of a dark purple colour are required with the least amount of labour and expense. But it is only a Beet; if one can get over that, which I cannot, it will not fail to please.

Sown in April it attains a good size by the end of June, and is in its beauty all through July, improving as the season advances, and is never finer than when taken up in November. The first or second week in April is when I should sow it in order to have it in condition in July, but I would not sow until the first week in May if it were not wanted to produce an effect before August. Of course it will grow in any soil. Sow the seed in drills, cover with light soil, and thin out the seedlings to 9 inches apart. Some sow in pans and transplant, but I do not perceive any benefit in the practice; on the contrary, if the weather be dry after transplanting many plants will probably run to seed and must be pulled up, spoiling the mass or line. I have not seen a more select stock than *Dell's Crimson*. It remains to be seen how long this Beet will continue true to its characteristics.

Of the *Chilian Beet* I cannot say much, this being my first

year of growing it, but unless it prove better than it has done, I shall discard it. The seed was obtained from a first-class firm, so that I have no reason to doubt its being true to name. The plants vary in the colour of the leaves; some plants have yellow stalks and veins, others red, but of the "deep waxy orange," and "vivid polished crimson." I have not seen any more than are developed in yellow or red Mangold, whilst the growth is coarse—very different from the refinement we aim at in flower borders or beds. It may do for shrubby borders, but not, I think, for flower gardens; in fact, I do not see why the Silver Beet should not have a place as well as this novelty. In the same way we might adopt in the flower garden other kitchen-garden plants. Where is there a more stately plant than the Globe Artichoke, so silvery in its foliage, and what plant has such a finely cut foliage as the Carrot?

The Chilian Beet I shall not grow again unless some one seeing it (and I have it in all the colours spoken of by "Q. Q."), should between now and November express himself in its favour. I have it in a conspicuous part of the kitchen garden; no one but myself seems to notice it—proof enough of its little attractiveness and beauty. In the flower garden I have no doubt it would soon be noticed, and might be thought from its novelty very beautiful, until it became known that it was nothing more than Beet with various-coloured leaves, green largely predominating in all.—G. ARNEY.

A GLIMPSE OF THE ROSES IN THE NORTH AND SOUTH.

I HAVE received the following communication from Mr. Henry Taylor, of Fenscote, Bedale, Yorkshire. It is reliable, as he is a first-rate propagator, cultivator, and judge of Roses, and not a mere scribbler.

"I have been to see Mr. Harrison's Roses, at Darlington. He has 20,000, one-half on the Manetti stock, and the other half on the Briar; both are fine, but he has a strong clay soil, which suits the Briar. Amongst the Roses of 1870 these were good—Albion, Baronne Chaurand, Blanche Meun, Ferdinand de Lesseps, Louise Wood, Eugénie Verdier, of immense size and the best of the year. The following were good and promising:—Jules [Semre?] Madame Dustour, Jeanne Guillot, La Motte Sanguine, good and free; Charles Lee, Henri Ledebaux, Clémence Raoux, Leopold II., Black Prince, Madame Norman, Ville de Lyon, Marquise de Montmart (properly Montmartre). Teas—Belle Lyonnaise, Adrienne Christophle, Madame Levet, Montplaisir. He marks the following Hybrid Perpetuals as extra fine:—Monsieur Woodfield, Nady Fibres, Felix Genero, and Thyra Hammerich." He adds further on in his letter, "Madame Auguste Verdier is a magnificent Rose, very large and perfect, a new Rose." Then again, "Velours Pourpre of 1866 is one of the best dark Roses, a fine Rose not much known. I have budded it."

At the same date I received a letter from my esteemed friend, Mr. William Paul, in which he says, "I am of opinion that Felix Genero is quite first-rate."

Roses are now blooming well again here. What a wonderful stock is the Manetti! We are told that we cannot grow Roses big enough for exhibition except on Briars. Such is a fallacy. The Rev. Mr. Going, vicar of Walworth, came here with his friend Mr. C. Ingram, and, being astonished at the size of the Roses, he measured with my marked tape one Rose, and found it to be 6 inches in diameter. I have had numbers of Roses 4 inches and over. What a man does, and what he can do and ought to do, are two different things. I brought down on myself satire, sarcasm, and the sardonic laugh some years ago for saying what I shall now repeat, that we have lots of possessors of Roses, and prize-winners, and scribblers, but very few experienced Rose-cultivators!

The best of the Roses of 1870, so far as I have been able to try them, are Princess Christian, Mademoiselle Eugénie Verdier, two beauties of great substance—on important point—and Marquise de Castellane.—"D., Deal," brought here beautiful blooms of Louis Van Houtte. My plant has made no sign.—W. F. RADCLIFFE.

VINE PESTS.—Many of the continental vineyards have been attacked this year by a grub which infests the roots of the plant. M. Marchand proposes the extermination of this pest by watering the soil with sulphureted hydrogen water, which

is well known to be very fatal to small animals.—(Student and Intellectual Observer.)

[This doubtless refers to the Phylloxera vastatrix.—Ens.]

SOME FLOWERS AND GRASSES SUITABLE FOR DRYING.

POSSIBLY some of your numerous readers who do not possess a stove or other heated structure in which to grow flowers all the year round, find it at times very difficult to obtain them for the decoration of the dinner-table and other purposes of house ornamentation. To those so situated I would recommend the following flowers and Grasses, all of which come under the general head of Everlastings, as suitable for drying, and so capable of being turned to account when fresh flowers may not be obtainable.

Of these the Helichrysums are a most interesting class of plants. They are easily cultivated, and, if the flowers be cut before the disc becomes fully expanded, will retain their colour for upwards of two years. *Rhodanthe Manglesii* and some of its varieties are also well worth growing for the same purpose, but they require a warm situation. *Ammobium alatum* is another, and, as its generic name indicates, will thrive in a poor sandy soil. *Waizia*, or *Moraa grandiflora*, I may mention, requires the protection of glass, unless in the more southern counties of England, where it may be planted out of doors after the middle of June. The *Aphelexis* is allied to the *Helichrysum*; all of the species are greenhouse evergreen shrubs, but they are not all hardy. The *Staticee* are a numerous class, and so useful that they must be included in this list. Several kinds of *Gnaphalium*, together with the varieties of *Gomphrena globosa*, or the Globe Amaranth, are more or less pretty, especially the latter, and well deserving more extended cultivation. *Humea elegans* is not by any means to be despised. When dried, its bronzy-red spikes show to great advantage when other things of the same character are not so plentiful. The *Xeranthemum* is a true Everlasting; the flowers, after being dried, may be, and are, dyed of any colour, and it can be grown from seed sown in the open border. *Acerelinium roseum* must also be in this list. Many others might be named, but these are sufficient for the purpose at present.

In the way of Grasses, as suitable for use with the above-mentioned, the following will be found to afford much satisfaction to those who have not hitherto grown them, and are not well acquainted with this elegant tribe of plants:—*Agrostis argentea*, *A. pulchella*, and *A. nebulosa*; *Briza maxima*, and the lesser species, *B. gracilis*; the graceful and useful *Eragrostis elegans*; *Lagurus ovatus*; *Stipa pennata*, or the common Feather-grass of the seed shops, a British plant capable of propagation either by root-division or by seeds, and will grow in any common soil. The Pampas Grass is also found useful; the elegant and stately inflorescence of this fine Grass can be easily preserved, and retained in use for a considerable time.

Such are a few of the more useful of flowers and Grasses capable of preservation. Those unaccustomed to their use are scarcely aware of the excellent effect they have when grouped in epergnes and such-like for the decoration of the dinner-table.—(The Gardener.)

CHAPMAN'S PATENT FLOWER-CASES.

I AM convinced that these cases must come into very general use. I lately sent by rail to a flower show twelve blooms of cut Roses, and they arrived without a petal shaken; and to the Royal Horticultural Society's late Show at South Kensington I brought up twelve *Gladiolus*, which won the first prize, and I took them home again without the least damage. It was the first case for *Gladioli* Mr. Chapman had made, and all who saw it were delighted with its success. The comfort of merely having to take out your box and put it on the exhibition-table is something to be grateful for.—D., Deal.

THE FLOWER TRADE OF ST. LOUIS.—It is but a few years since the entire flower trade of the city was in the hands of a few old women, and the list of flowers on sale was of the most limited character. St. Louis was held up in contrast with Chicago and other cities, and denounced by interested strangers as displaying an utter want of enterprise. We have watched the indications of progress in this direction, especially during the last ten years, and find an amazing expansion and develop-

ment. We have now commercial floral establishments, green-houses, gardens, &c., that are a credit to the community, and an illustration of progress in the love of the beautiful that cannot fail to work a marked effect on the health and moral character of the community. The total sales for a single week this spring come to the very neat amount of 3550 dols. The annual sales of a single firm for several years amounted to 12,000 dols. In regard to the character of the stock for sale, it embraces every article in the greenhouse, conservatory, and open garden; with all the equipments for parlour, window, and table floral ornamentation. In the department of bouquets and cut flowers what amazing progress has been made. The finest flowers of the garden and conservatory, arranged in the most artistic styles, with all the most recent accompaniments, as rich and costly holder, vases, baskets, &c. The houses and grounds are generally in excellent order, and the collections embrace everything new as it comes out in every department of floriculture, whether in Europe or the United States. The displays made at some of our fairs and horticultural exhibitions fail to furnish an adequate idea of the variety or extent of the floral trade of our city, and this is yet in its infancy.—(*Rural World*)

KENFIELD HALL AND ITS CONIFERS.

In passing by the South-Eastern Railway through the Weald of Kent the traveller remarks that it is a level tract highly cultivated, plentifully interspersed with woods and coppices, Hop gardens and orchards; that there are small meadows and equally distinctive corn fields separated by hedges of every conceivable shape, with considerably more than the usual number of dwelling-houses met with in a purely agricultural district, only it is still in these buildings are seen until one is close to them, as the woods and orchards conceal the comfortable farm houses and cosy cottages with which the district is studded. No high embankment gives the traveller a distant view, and only occasional gaps in the almost continuous line of coppice, trees, orchard, or Hop garden that hem in the railway afford glimpses of farm-objets. It is only when the train pulls up at Aford that another kind of scenery presents itself, especially if the journey is made in the direction of the ancient city of Canterbury. The heavy Wealden clay and comparative flatness give place to gently rising hills, which by degrees assume greater altitude, and gradually Hop gardens and orchards give place to corn fields of considerable magnitude, and should there be any portion of such fields in tillage, the colour reveals at once that chalk predominates. Corn and green crops are the principal objects cultivated, the valleys being meadow land, with now and then orchards and Hop gardens, and it is not unusual to see the crests of the hills clothed with wood. This undulating country bordering the valley of the Stour between Asford and Canterbury, along which the line of railway runs, is not without its interest. Occasionally mansions are seen, and still more frequently the parks attached to them. The parks of Eastwell, Godmersham, and Chilham Castle form conspicuous objects along the line of route, but it is to one some distance from the railway that I would here more especially call the attention of the reader.

About three miles eastward from Chartham station and six from Canterbury is Kenfield Hall, one of those commodious brick edifices whose erection might, perhaps, date from the beginning of the last century. The road thither from Chartham leads over some of those chalybeate downs which afford such excellent materials for roads; flints in great quantities were to be seen wherever the surface was not hidden by the crops, for these uplands were invariably arable land, the valleys being generally meadows; but care had been taken to break the largest of these stones, so that rarely was anything larger than ordinary road metal to be seen, so that the action of the harrow and other agricultural implements should not be impeded.

Passing along the crest of one of these ridges some little distance, we at length obtain a glimpse of the residence we are bound for, occupying a position on a sort of natural terrace facing the north, and overlooking the valley which lies between us and the grounds. The house is so well sheltered by timber that only a portion of it can be seen at a time until it is nearly reached, when its elevation is found to be more than might be expected, although there is still higher ground to the south of it. The carriage front is at the north side, the various offices being to the west, while a more spacious front opens to the south, where there is a neat and well-stocked flower gar-

den. The dressed grounds, occupying many acres, surround the whole on all sides but the west, which abuts on the park. The mansion and grounds are in the centre of a well-wooded park of large size, and sufficiently broken by undulations to render it interesting without being romantic. The character of the soil is much superior to that of the downs I have noticed. The soil of the dressed grounds, including the pinetum, is a rather stiff loam, such as one often meets with at the base of chalky hills, and much deeper than is generally the case.

A good-sized flower garden on turf extends some distance southward of the house, ample space being allowed between the beds, which in no case approach each other nearer than 10 feet, while they are each of not less than 6 or 8 square yards. The design of the whole was pleasing, and the beds were all filled with well-selected plants of the usual character. I noticed very good beds of *Geraniums* Lady Cullum, *Mrs. Pollock*, *Beauty of Calderdale*, and other ornamental-leaved varieties, as well as kinds cultivated for their flowers, *Lord Palmerston* being by no means the least important. The most striking bed was a circular one about 12 feet in diameter, composed entirely of *Centaurea c. nobilissima*, *Coleus Verchaffii*, and *Golden Pyrethrum*, the last-named being used as an edging. The rich colouring of the *Coleus* and *Centaurea* I have never seen exceeded. Other beds to the east of the house were of a more mixed character. A piece of interesting rockwork, forming a suitable screen between this part of the garden and the carriage entrance at the north-eastern corner, was well worthy of inspection, for the fragments of stone composing it are said to have been taken from an old religious edifice in the neighbourhood that had been demolished. Curved corbel, portions of clustered columns, and capitals with some foliage in an exceedingly good state of preservation attest the quality of the stone, which assuredly was not obtained in the neighbourhood. Relics like these give a charm to rockwork, which mere flints and petrified clay fail to do. There was likewise no lack of plants suitable for such a place. A very fine *Samaris* (*Rhus Cotinus*), at a short distance, in full flower attracted my attention; this very handsome shrub is not planted so much as it deserves to be, neither is the common *Berberis*, which in another part of the grounds was really beautiful.

Having described the flower garden and its appendages as adjoining the mansion on its southern, eastern, and north-eastern sides, I shall now proceed eastward, and as there are plenty of walks leading in that direction, I will follow the most southerly one, by which I soon come to the choice Conifers and shrubs for which this place is noted. Broad, well-kept gravel walks in easy graceful curves intersect the grounds in all directions, now and then approaching the boundary fence so as to afford a peep into the park, and at other parts skirting a mass of shrubbery on one side, with a thriving Conifer on the other, the intervening spaces being closely-shaven turf. Some of the shrubbery was necessarily dug ground; but even the marginal belts of these were in many places made accessible by neatly-formed turf walks curving through them. The centre of this extensive area, the ground originally level, had been broken into agreeably-shaped mounds in the most natural manner possible, and these, being planted with choice specimens, gave an ever-varying character to the scene.

The only attempt at formality was a bowling-green or croquet-ground forming a circle upwards of 100 feet in diameter, and sunk about 2½ feet below the surrounding level. Flights of steps descended to it on opposite sides with fairly-grown specimens of Irish Yews flanking the steps, and on one side a pretty summer-house occupied an elevated position overlooking the circle, the other being approached by an important walk. The quality of the turf forming the bottom and sides of this fine bowling-green showed that pains had been taken to secure a suitable depth of good soil for the grass to grow in, which is not always the case where extensive ground works are carried out. The undulations of the ground are, I believe, wholly artificial, for although a long period of dry weather had preceded my visit (early in August), and many meadows and grass fields had not thrown off their russety garb, there did not appear to be any place in the grounds more burnt up than was common everywhere, while the general aspect of the Pinuses and other shrubs was such as indicated the most robust health, with the exception of those which formed the belt or boundary to the north; but as these were for the most part common trees and shrubs planted for shelter, and, consequently, exposed to cold blasts, their weather-beaten appearance to windward is not to be wondered at. The valuable trees inside had sustained no

injury, and the past winter had done scarcely any damage to the collection at Kenfield.

I will now describe more particularly some of the contents of the pinetum. First on the list is the Wellingtonia, which here, as in most places, grows most luxuriantly, the tallest tree being 33 feet high, and the spread of its branches at bottom 26 feet. Here I may remark that the specimens of this tree at Kenfield (and there were many of 31, 28, 26, and 23 feet high and downwards), differed in outline from those met with in most places, where the general outline is a cone with the greatest diameter at 2 or 3 feet from the ground. This is the case with most of the Wellingtonias at Linton, while at Kenfield it was just the reverse; the trees there resembled a cone placed upon a sort of circular base of 2 feet in height or more, so that although the diameter of the tree above described was 26 feet at the bottom, it would not be more than 21 feet at 3 feet higher up, but from thence to the apex it formed as true a cone as could be desired. Both it and the other trees were densely clothed with branches covered with healthy foliage, and promised to vie with any indigenous tree. There was but one exception, a tree whose history I should be anxious to learn, as I expressed my suspicions it might go the same way as one at Linton did. However, all the others were pictures of beauty.

The Deodar was also well represented, and handsomely-clothed trees met the eye at almost every turning, and what is more, they seemed to retain the Deodar character, which is not the case with all the early-planted specimens of this tree, for many are gradually merging into the Lebanon form, losing alike the glaucous hue and pendant habit of the original Deodar. I believe these trees suffered but little, if any, either in 1860 or 1866, and many of them are assuming the dimensions of useful timber trees. A group of *Abies Menziesii*, occupying a rather prominent position in the grounds, promises to far eclipse the Common Spruce, which formed part of the outer belt; for, while the former were healthy and vigorous, and evidently 50 feet high, the latter showed unmistakable tokens of disease that will carry them off ere long if they be allowed to stand till then; this is the fate that has befallen them at Linton. The Spruce seems to luxuriate until about twenty years old, then it comes to a sort of standstill; a shabby, half-dead appearance carries it on some ten years more, and it then succumbs. Whether *Abies Morinda* and *A. Menziesii* be destined for a longer existence remains to be proved. Certain it is that *A. Menziesii* at Kenfield was all that could be wished. *A. Morinda*, though healthy, was less rapid in its growth; but there were some fine specimens of *Pinus Cembra*, which, I may remark, is not so much sought after as it deserves to be. Its upright, almost cylindrical form, contrasts strongly with the spreading habit of *Pinus excelsa*; there are good specimens of both at Kenfield, but the inclination of the latter to grow upwards was manifest there, as at other places; however, the density of the rich glaucous foliage, and its horse-mare-like texture, will ever render this tree a favourite. *Pinus ponderosa* was not so good as I have seen elsewhere; in fact, this is seldom met with in good form. The same, however, could not be said of *Pinus macrocarpa*, which was all that could be desired; and one that I would have called *P. Sabiniana* was likewise good. *Pinus Benthamiana* was promising, but had not had time to attain the dimensions of the others, while, perhaps the prince of all the *Pinus* family, *P. insignis*, was unsurpassed in beauty of form and healthiness; it had, however, suffered in the winter four years ago, but was a fine, handsome tree. *P. radiata* was said to have suffered more, and had since been destroyed. Most excellent specimens of *P. austriaca* were met with in various directions, some thriving better in the outer belt than the Spruce Fir. *P. Jeffreyana* and others were also well represented.

Of the *Picea* family there were several good specimens of *P. Pinsapo*, one large tree growing in the outer belt was fully exposed to the cutting north winds, which are so trying to all kinds of trees, and which last winter affected our native evergreens as well. It was, however, satisfactory to observe that this popular species had not suffered more than others, and certainly not so much as the Spruce; most of the specimens, however, showed a tendency to be dumpy, unwilling to grow upwards, which is a fault with some others of the *Pinus* tribe. *Picea cephalonica* was better, but this also has in most cases a disposition to spread laterally, still its beautiful green tint will always entitle it to a place. The prince of this section, however, is undoubtedly *P. Nordmanniana*, of which a fine specimen 26 feet high, and of symmetrical growth, occupied a prominent position, and well deserved it. *Picea nobilis* was also a fine

tree, but less fortunate in its site; it had, like others of its class elsewhere, borne fruit a year or two previously, but its upright growth gave promise of maintaining that superiority amongst its brethren which its name implies. Of the same glaucous hue was a remarkably fine tree of *P. magnifica*, the height of which I unfortunately omitted to ascertain. Promising specimens of *Picea Lowii*, *lasiocarpa*, and *Parsonsi*, perhaps all the same species, were also noticeable. *P. lasiocarpa* has, perhaps, the longest foliage, which is also awl-shaped, and at Kenfield it promised to become a tree of some magnitude, its growth being rapid, and its form good. I found here, as at many other places, that *P. Webbiana* had succumbed to some of the hard winters of late years. *P. amabilis* and *grandis*, also thought to be synonymous, were likewise good, and a very promising plant of *P. bracteata* appears likely to be amongst the first of its series in this country, and to all appearance will become a favourite. I believe it has not been long introduced, but still sufficiently so to establish its hardiness.

Near some of the Conifers just named were excellent specimens of *Cryptomeria japonica* and *Lobbii*, the former being about 30 feet high. *C. elegans* was also in a promising condition, being upwards of 7 feet in height, while *C. Lobbii* rivalled *C. japonica* in height, and still more in luxuriance, but as the difference between it and *C. japonica* is so slight, perhaps both may merge in one hereafter. *C. elegans*, however, is one of the handsomest Conifers of recent introduction. Of *Cephalotaxus Fortunei* there were both male and female plants, the two differing widely in appearance, but they may only be regarded as shrubs of moderate growth, or even lower than that. Not so, however, the Japan *Retinospora*, of which good specimens of *squarrosa*, *obtusa*, and *pisifera*, stood out conspicuously, the last named promising to become a good-sized tree, while the silvery graceful appearance of *R. squarrosa* contrasted well with plants of a deeper hue. *R. leptoclada* also promises to rival the Irish Yew in form and size, although differing widely from it in foliage. Some variegated forms of *Retinospora* were also pointed out, but their liability to return to the original condition impairs their interest.

I believe all the dwarf forms of the *Pinus* family were well represented. By far the finest specimen I have seen of *Sciadopitys verticillata*, the Umbrella Pine, was shown me, as well as *Abies Kumpferi*. The specimens of *Abies clauseniana*, *Pinus pygmaea*, and others, contrasted strongly with the upright form of *Thuja Lobbii* and *Menziesii*, each of which was upwards of 20 feet high. *Thuja gigantea* was here, as elsewhere, less robust, and somehow is hardly deserving the name it bears, as its growth is slower, its form cylindrical, and the head rounded rather than conical. *Thujaopsis borealis*, however, was flourishing, and equalled *T. Lobbii* in sturdiness of growth. One or two good plants of *T. dolabrata* were also pointed out, as well as the more recently-introduced *T. latevirens*, but it was hardly large enough to give an opinion upon, as were also some other varieties or species of *Thuja*, and possibly several of those which now present a marked difference may in time merge into others, and the same with *Juniperus* and *Cupressus*. Conspicuous amongst the latter were *C. macrocarpa*, 30 feet high; *C. funebris*, more inclined to spread than grow upwards; and *C. Lawsoniana*, by no means so satisfactory here as I have met with it elsewhere, although plentifully planted. Other species, as *Cupressus McNabiana*, and *majestica*, were good.

The *Juniper* family were also in force, and, as I have noticed elsewhere, their inclination to fruit seemed to check their growth, but I confess my recollection of this interesting section is not sufficiently clear to deserve recording. One or two excellent plants of *Taxodium sempervirens* ought not to be passed over, as I do not think better specimens can be found. One of these in the interior of the grounds had not received any injury during the past winter, yet another exposed to the north winds had suffered; both were high fine timber-looking trees. *Araucaria imbricata* was hardly so much at home, but it was, nevertheless, upwards of 30 feet high. *Liocedrus chilensis* was as good and as promising as it usually is, while one of the most conspicuous of all *Pineas* in many places, *Abies Douglasii*, fell short of what might be expected of it. Although there was a good full-sized tree of it, yet the proper robust character and dense deep green hue were wanting, proving that the soil did not exactly suit it. The too great abundance of calcareous matter, however useful it may be for the welfare of a number of plants, is inimical to the well-being of the Douglas Fir. There was, however, a very fair specimen of the deciduous *Cypress*; and though the equally interesting *Salisburia adiantifolia* was much

smaller, it was a good specimen of its kind. The more recent introductions were also duly represented, for Mr. Thomson, the proprietor, who for thirty years and more has been an ardent admirer of Conifers, and has during that time added to his collection all that were worth having, still secures anything new that may appear, and the collection lacks but little to make it unique. Other shrubs also were not forgotten, for I noticed a border containing an excellent collection of Hollies, and now and then the whole was enlivened by the beautiful bloom of *Althæa frutex*, Virginian Sumach, and other gems of the shrubbery.

I have said the pinetum, or pleasure-ground enclosure, was surrounded by the park; it ought also to be mentioned that the former is so large as also to enclose within it—nay, almost conceal from view, the kitchen garden, where some good vegetables are growing in spite of the dry weather, and the Peach trees on the walls were loaded almost too heavily. Outside the kitchen garden, but still within the dressed grounds, there was a group of plant houses and pits, the latter partly hidden from the pleasure grounds by a fernery. They were all in excellent order, but the space already occupied by the description of the pinetum forbids my entering into details here. I must not, however, omit to mention a very promising young orchard two or three acres in extent, where there was as fine a lot of Plum, Apple, and Pear trees well loaded with fruit as can be met with anywhere. The Pear and Apple trees were mostly pyramid-trained, and planted about 8 feet apart. The Plum trees were grown as standards, and were heavily laden with fruit.

This plantation is outside of the park, and on the way to it I passed a Horse Chestnut tree in which one branch was growing into another, forming a natural graft in a manner I had never before seen. The tree was of good size, and at 12 feet or so from the ground a limb, about as thick as a man's body, extended from the trunk in a diagonal direction at an angle of upwards of 40°, and about 3 feet higher up the bole another limb, much smaller than the last, projected at an angle of about 25° or less, so that at some 10 feet or so from the bole the two limbs crossed and united, the junction presenting none of the swellings or excrescences so common in grafting, the bark being as smooth and uniform as on any part of the tree. A short distance from the junction the limb broke out into branches. The appearance was that of a well-constructed brace, and no doubt the graft acted as such; but although I have often enough seen natural grafting in Beech and other trees, I never saw anything to equal this, and Mr. Thomson, who takes especial notice of trees and their various peculiarities, pointed it out to me as deserving of notice.

The park is well studded over with groups of trees and single specimens, especially Horse Chestnuts and Thorns, with some good Oaks and Ashes. Mr. Thomson, who is also a great admirer of the common Yew and Scotch Fir, pointed out a piece of woodland on the crest of one of the distant hills in which were some good specimens of the English Yew that he made an especial point of preserving. The wild Cherry, or *Gascogiu*, he also admired, as well for its beauty in autumn when its foliage dies off crimson, as in spring when its snow-white blossoms give such a charm to woodland scenery. I believe he has planted this tree extensively in places where its beauties will be seen to advantage; and in a district where cultivators, as a rule, have denuded it of all its beauties, an admirer of Nature's noblest productions like Mr. Thomson must be looked on as a benefactor.—J. ROBINSON.

[Our readers will remember that some time ago Mr. Covey, at Kenfield, replied through our columns to an inquiry made about the height of Wellingtonias, and we hope others having fine trees of this species will also favour us with the dimensions, as well the soil and situation in which the trees are growing; for although the Wellingtonia seems to accommodate itself to almost every place, there is no doubt certain soils suit it better than others.—EDS.]

ORCHARD-HOUSE PRODUCE.

I SEND an account of this year's produce. I have gathered and sent to table 850 Peaches and Nectarines, and 100 really good well-finished bunches of Grapes out of the orchard house, of which I wrote some time ago. The Peaches averaged 9 inches in circumference, and the Nectarines 8 inches. The largest Peach measured 11½ inches in circumference, and weighed 11½ ozs. I think even the most sceptical (no one can

be more so than I was three years ago), must own that orchard houses are really useful, profitable, and highly ornamental. They are more especially adapted for the villa residences near London, where a Peach wall is out of the question, but orchard houses might easily be erected, and with them the crop is almost a certainty, at least with anything like good management.

I find the syringe my most useful friend, having had no symptoms of insects, and the trees rejoice in frequent applications of house sewage made lukewarm by diluting it with hot water.—J. H. DAVIS, *Hazelwood, Upper Norwood.*

NEW VERBENAS AND GOLDEN FEATHER PYRETHRUM FOR BEDDING.

"AYRSHIRE GARDENER" condemns the new and improved Verbenas as being utterly incapable of enduring any hardship. I do not know any of the old sorts of Verbenas which will endure hardships such as the Zonal Geraniums have to undergo. If a Verbena will not stand dryness at the root, and cold and want of light during the winter, it is condemned. Small half-rooted plants are pricked out from cutting pots into beds in May and June, and expected to grow and flourish. Daily waterings are as sure to injure these plants as dry-and-dust treatment. A watering once or twice a-week, with a little liquid manure each time, is enough for any Verbena; and every plant ought to be well rooted and established in 4-inch pots before bedding-out, and the foliage healthy, free of thrips, red spider, and green fly. If only a little more pains were devoted to Verbenas there would not be such an outcry against them.

Contrary, again, to "AYRSHIRE GARDENER'S" experience, I can see Golden Feather Pyrethrum as good now as ever. Instead of waiting for the flowers to open and cover the plants, if the flower-spikes are cut closely down at the first appearance of a head of bloom, the plants will continue dwarf and bushy to the last. Though the heat blanches the colour, it is, however, quite as golden now, where this treatment is pursued, as Crystal Palace Gem or Cloth of Gold Geranium.—AN AMATEUR.

IN "AYRSHIRE GARDENER'S" interesting notes on bedding plants in your last issue, I was sorry to learn of his failure with, and condemnation of the above subject as a summer bedding-out plant, inasmuch as here it has proved all that could be desired. If I may judge by last season's experience of its attributes, I will venture to say it will continue so until the end of the season, with no more trouble bestowed upon it than is accorded to the various other occupants of the parterre, with their peggings-down, picking off of seed heads, &c., the only attention required by the Golden Feather being by occasional picking off of the flowers as they appear.

I may add, we have Golden Feather Pyrethrum here doing duty in charming contrast with large beds of *Stella Nosegay* Geranium, to which it affords an effective margin, the greenish yellow of the latter affording a pleasing harmony with the scarlet crimson inflorescence of the latter. And as an edging to such as *Coleus Verschaffeltii*, *Iresine Herbstii*, *Centaurea ragusina*, blue *Lobelia*, *Verbena Purple King*, &c., I have also found it to be most effective, proving in some instances more satisfactory than *Cloth of Gold* Geraniums will only flourish in a comparatively rich and moist soil, whereas the Golden Feather is not so particular as to the condition of the medium in which it grows, unless dust dry. I trust, with due respect to "AYRSHIRE GARDENER'S" opinion, that your readers who have not as yet patronised the Golden Feather Pyrethrum as a summer bedding plant may not be deterred from giving it a trial next season, as I am confident that with due attention to picking off the flower heads as they appear, and to keeping the roots in a growing state by an ordinary amount of moisture, success will be thereby insured.—WILLIAM GARDNER, *Gardener, Lower Eaton Park, Stratford-on-Avon.*

BEDDING PLANTS IN 1870.

(Continued from page 130.)

IN continuing my remarks on bedding plants this season I will now proceed to the Zonal Pelargoniums, and will take the flowering section first—that is to say, those grown for the beauty of their flowers, and not of their foliage, and in which

the foliage is only a secondary consideration, though it must be always borne in mind that coarse large leaves, or straggling footstalks to the leaves, are a great drawback to the merit of a Geranium, however good the flowers may be.

It is difficult to classify Geraniums now by their colours, as there is almost every gradation of shade in reds, from a dark crimson to an orange scarlet, and so on; but I will endeavour to take the different colours in order as nearly as I can, beginning with the crimsons and crimson scarlets.

Of these, the best two with me have been Waltham Seedling and Bayard. The first is a trifle the darker, and the latter the brighter; they are quite distinct in habit, and ought both to be grown. Bayard, now that I have given it a season's trial, is certainly the best crimson scarlet I have grown in beds, and I must confess myself mistaken as to the size of the truss, which in some notes I sent you in the spring I said I thought would not be so large as Waltham Seedling, but it is, on the contrary, larger. It is very free-blooming, and the trusses last well; its only fault is that the stalks are hardly strong enough for the heads and fall about, and in this respect Waltham Seedling is better, as the flower stalks are short and stiff, and show every head. Good as Bayard is, Mr. Pearson has better varieties in store, which he has not yet sent out, especially some seedlings of this year, which I have twice carefully looked over, and of which I will send some notes at a future time. I think, also, Douglas Pearson, Thomas Speed, Duke of Devonshire, William Thomson, and some others he sent out this spring, are quite as good, if not better.

Other crimsons I have tried this year have been International, Eclat, Lord Palmerston, and Le Grand. International does not flower freely enough. Eclat, though it has a very fine truss, is too long in the flower stalk, and too coarse in the foliage. Le Grand is at times very good, but the flowers do not stand sun well, and it runs to seed. A very promising variety which I had in a trial bed is Stanstead Rival (Downie, Laird, & Laing); it is a brighter and lighter-coloured crimson than those before mentioned, a very fine truss, and free-blooming.

Two other very good sorts of dark crimson I have not grown myself, but seen elsewhere, are Vesta and Glory of Waltham. The first was highly spoken of at Chiswick last year, and I have seen it very good this; very dwarf and compact. The latter I saw very good at Studley Royal (Earl de Grey and Ripon's), under the care of Mr. Clark, the rich dark green of the foliage harmonising very well with the colour of the flower. Lord Palmerston is so well known I need not make any remarks on it. It is an old favourite, and I do not like to discard it; it is exceedingly good as a late bloomer. It is, however, far surpassed by Duchess of Sutherland, though they are not of exactly the same shade of colour, as Duchess of Sutherland is brighter, and it is a first-class dry-weather plant. It has been in full beauty now with me ever since I came back (21st of June), and is as full of fresh flower stems now as ever. Something of the same shade of colour is Lady Kirkland, another of Messrs. Downie, Laird, & Laing's seedlings, and which was kindly sent me on trial by Mr. Charles Turner. It has the largest head of bloom I have almost ever seen on a Nosegay Geranium.

I will take the scarlet and orange scarlet sections next, as Cybister, Lady C. Grosvenor, Multiflora, Grand Duke, William Underwood, and Rival.

Cybister has again been very good, but rather too leggy in habit; it, however, does not run to seed in dry weather. Lady Constance Grosvenor has been far better with me this year than last, and has bloomed much more freely; the colour is undeniably good, brighter than Cybister, and the habit more dwarf and spreading; its only fault is that the flower stalks are not strong enough for the truss, and it is, consequently, much better in dry weather than wet. Multiflora has not been so good as I expected; it has, however, a very nice dwarf habit, but the flower trusses are not large enough individually, though they are very freely produced; but it is of a very rich colour, and the individual blooms are large. Grand Duke is an orange scarlet, with an immense truss, good footstalk, and vigorous habit; of the same sort of growth as Le Grand, but a freer bloomer, and would be a splendid sort for a large bed or a ribbon border. It might be coarse in wet weather, but is certainly very good in dry.

William Underwood is the best red Zonal with me, but like all of the Zonals I have ever tried, it does not branch freely. I am gradually discarding all the Zonals (as I said in the spring), for this reason. I have tried a great many, as Clipper, Dr. Lindley, Herald of Spring, Miss Martin, &c., and always

find, that though by pinching-in closely in the spring, and putting them out as bushy plants, they make good beds at first, yet unless planted very thinly they never branch, and the same number of stems almost will be found on them at the end of nine or ten weeks as they had when planted out; moreover, although the individual flowers are more circular and of a better form, yet it is seldom they make a very large truss, and now that the Nosegay section are so much improved by crossing, some of the blooms of the Nosegays are almost as good in shape as the old Zonals with double, or, I might say, three or four times the amount of truss.

Of all the Zonals, Rival has, to my mind, the finest-shaped flower, but though I shall try it another year, I do not think it will stand wind or rain. Glow is another very fine scarlet, but the centre of the truss is too crowded, owing to the stalk of the individual flowers being too short.

Among the orange scarlets of the Hybrid Nosegay section, two that were sent out this year by Downie, Laird, & Laing are very good, Lady Hawley and Sunlight. Of the two, I prefer Lady Hawley; it has an immense truss with a good stiff footstalk, which holds the truss erect, the habit is also good, and I shall be much mistaken if it do not prove a great acquisition. Kentish Fire and Masterpiece were planted out too late in my trial beds this year to give them a fair trial, as they had been too long in small pots; both, however, I think are good varieties.

I hardly know whether to class Godfrey among the orange scarlets or the next class I shall name, the Reds. It is very free-flowering, but the footstalks are too long; still, it is a good variety.

I will defer my remarks on the other colours till another week. I only wish, in conclusion, to ask some of those who are now cutting their beds of Geraniums to pieces to get cuttings to try the plan of striking them later, when they finally have to pull the garden to pieces in the autumn, putting them in small pots, five or six cuttings in a 4 inch pot, and placing them on shelves close to the glass in vineries or elsewhere. It is a great mistake to think that plants are hardened by being kept cold during the winter; and cuttings struck in this way, and kept growing all the winter through, soon overtake cuttings that are taken off now, struck in the open border, and then potted off for winter; and still more will they surpass those that are pricked close together in boxes or pans to be struck in the open air now, and stored in these pans all the winter in cold frames. Warmth during winter will not make Geraniums tender, so long as they have plenty of light and are near the glass.

The earliest and best Geraniums I had this year were some I put into the stove in November to grow on for cuttings; and the cuttings I struck in the stove in January and forced on were more forward and better plants than those struck in the open air in August, were earlier in bloom, and have lasted quite as long—in fact, I cannot in any one instance see that they have less bloom now than those which were more backward in coming into flower. They were removed from the stove into a light double-span house the third week in March, and were not moved out of this house till they were taken out to be planted in May. I tried this with several sorts—Bayard, Grand Duke, Eclat, Godfrey, Blue Bell, Lady Constance Grosvenor, Violet Hill, Ne Plus Ultra, &c. Of course it would not do in stoves where climbers were growing over the roof, or where shade is used for ornamental-foliaged plants, but where Geraniums can have plenty of light and are not too far from the glass there need be no fear of making them tender from too much warmth during the winter. The best use for cold frames is not to winter plants in, but to put them into in spring, using vineries and other houses during winter.—C. P. PEACH, *Appleton-le-Street*.

(To be continued.)

EXPORTING CUTTINGS OF FRUIT TREES TO AUSTRALIA.—In the form of cuttings, all the new varieties of fruit trees may be introduced with the certainty of success. The importance of this will strike all who have experienced the losses and disappointment attending the importation of the trees. The introduction of new varieties is by this means rendered a very simple and inexpensive matter. A case of 6 cubic feet capacity will contain some thousands of cuttings, the trees of which would require a space equal to many hundreds of tons measurement. Another advantage with the cuttings is, that the case may be hermetically sealed and stowed away like ordinary merchandise; whereas, special instructions as to care (which

is seldom exercised) have to be given as to the stowage of the cases containing trees.—(Report of the Horticultural Society of Victoria)

NOTES AND GLEANINGS.

INTERNATIONAL EXHIBITION OF 1871.—We are requested by Her Majesty's Commissioners to state that there is no foundation for the rumour that the International Exhibition appointed for 1871 is to be postponed by reason of the war. The first of the series of Annual International Exhibitions of selected works of fine and industrial art and scientific inventions will take place next year, as already announced.

— Mr. W. Taylor, gardener to J. Yates, Esq., Lunderdale House, Highgate, informs us there is a fine specimen of the *LITTEA JUNCEA* now in flower at that place. The spike is 15 feet in height.

— We are requested by the Council of the Royal Horticultural Society to state, that in consequence of the works now in progress for the Annual International Exhibitions of next and following years, the ROYAL HORTICULTURAL SOCIETY'S GARDENS at SOUTH KENSINGTON, will not be open free to the public on the 26th of August, the anniversary of the late Prince Consort's birthday.

WORK FOR THE WEEK.

KITCHEN GARDEN.

EVERY attention should at this period be given to the high cultivation of winter crops. Where sufficient labour is provided at all times, not a weed should be allowed to show its head. When, unfortunately, weeds have done so, the use of the spade is recommended instead of the hoe. Besides, it is as economical in the first instance, excepting in very hot and dry weather like the present, for, unless the hoeing be succeeded by a raking, the hoeing will in general have little effect. Moreover, the benefits of exposing the soil to the air are very considerable, especially in ciferate soils, such as those of most of our kitchen gardens. All the *Cabbage* tribe, from the Early York Cabbage up to the Cauliflower, should be soiled up the stem as high as possible. When such crops are on poor land a dressing of guano or fowls' dung at this period would be of eminent service. It might be introduced as in South America in the cultivation of Tobacco, Indian Corn, &c.—viz., by hand around the stems of the plants. It is advisable to mix it with four times its bulk of dry old tan, sawdust, charcoal dust, or anything which will duly separate its particles. This process should, of course, precede the soiling. Where plants of this family are liable to "club" this course will be found of much service, as they frequently depend for their existence on a few late-made roots. Let a good breadth of *Coleworts* be planted out in well-prepared ground; as before observed, the Onion beds will be available. Let the winter *Cauliflowers* be sown directly. Late plantings of *Endive* must be made forthwith. The plants will be eligible to move with balls of earth into frames in November. The soil must be very rich. This is an excellent time to make a sowing of the Brown or Bath Cos and Hammersmith *Lettuces* to remain where sown through the winter. The beds should be elevated considerably, the higher the better, and the seed scattered broadcast rather thinly. A rich border should now be prepared, and planted with the Bath or Brown Cos *Lettuce*; these will carry on a supply from the open ground until Christmas, if protected. *Leeks* are most useful in a variety of ways, and should now be soiled up after the manner of Broccoli; a dressing of guano may be introduced previously, if the soil is not sufficiently rich. The old *Strawberry* rows should now have attention. The leaves of the runners will shade the principal leaves of the mother plant, and therefore some gardeners mow down the runners in order to throw sunlight on the leaves left. Mowing down the old plants is an absurd process which some still adhere to. If the *Tomatoes* are over-luxuriant, cut away a portion of their roots.

FRUIT GARDEN.

Go over the fruit trees and stop about half the shoots, beginning, of course, with the strongest, for a general stopping at this time would probably be of little further service than to induce the production of a mass of useless spray; whereas stopping the stronger shoots, or those which incline to grossness, will direct the sap into the weaker ones, which will be strengthened, while the buds on the shoots that have been stopped will become full and plump without starting into growth. The only effectual method, however, of curing a gross habit of

growth, when it occurs in ordinary seasons, is root-pruning, or keeping the roots within proper limits by means of shallow well-drained borders; and should it be found that the shoots after stopping incline to start into growth, it will be advisable as soon as the fruit is gathered to open a trench at a moderate distance from the stem of the tree, and to cut the stronger roots. This will be of the greatest service in checking growth, and will probably do more towards securing ripe wood than anything else that could be adopted.

FLOWER GARDEN.

In many neighbourhoods bedding plants are only just coming into full beauty. Go over them frequently, and without loss of time remedy any defects that may be perceptible, for the flower garden this year will be enjoyed but for a comparatively short season; and now that the plants are in beauty every means should be used to render them as enjoyable as possible, by maintaining the most perfect order and neatness. Where the stock is clean and growing vigorously this will involve considerable labour, and it will be necessary to look over the beds frequently, pegging down where necessary, removing decayed flowers, and cutting back such of the shoots as may incline to encroach upon the edging of the beds. Keep herbaceous plants neatly tied up, and cut off the lower-stems of any that are becoming unsightly. Take advantage of every leisure hour to put in cuttings, and use every possible dispatch with this work until there be in a fair way for rooting a good stock of such plants as are known to be difficult to winter except as well-established plants. Make gravel walks perfectly clean and smooth by weeding, sweeping, and rolling, as may be necessary, and keep climbers on walls within due limits. Propagate *Hollyhocks* by cuttings. Mark good seedlings, digging up all single and semi-double varieties. Take off the tops of seedling spikes, if not already done; it throws strength into the remaining flowers, and encourages the formation and growth of the seed. A few *Crocuses*, *Snowdrops*, &c., may be planted soon to obtain an early bloom.

GREENHOUSE AND CONSERVATORY.

Continue to look over climbers, borders, &c. Large specimens which had been removed out of doors to give room, will soon require to be replaced in these structures; indeed, the whole of September will occasionally call for business of this kind. The earth worm is a greater enemy to pot plants in general than low temperature. Look well after late-flowering plants. The late *Heliotropes*, *Scarlet Pelargoniums*, *Petunias*, &c., if preceded with as recommended weeks since, will now be somewhat potbound, and will in that state, with the application of weak liquid manure, produce abundance of blossom on a light shelf until the beginning of December. *Lachenalias* should be instantly repotted, and the *Persian Cyclamens*, if planted out in spring, will now be fine bushy plants full of young leaves. They must be taken up forthwith with all the soil possible, potted carefully, and placed in a cold frame or propagating house; a bottom heat of 75° would be an advantage, with a very moderate atmospheric temperature. After three weeks of this treatment they may be introduced to the greenhouse, where they will produce their fragrant blossoms in abundance from November until April.

STOVE.

Many of the earliest growths of *Orchids* showing signs of ripeness in the leaf and plump pseudo-bulbs, may be removed forthwith from the excitement of the growing house. Any situation in the light where a temperature averaging 60° night and day can be guaranteed, will suit them well. A very moderate amount of atmospheric moisture will suffice.

COLD PITS.

Young stock in cold pits intended to flower next season, should be exposed to the midday sun, in order to ripen the wood, taking care not to do this so rashly as to injure the foliage. This, however, will only be proper in the case of such things as have already made plenty of young wood, but it is advisable after this season to be anticipating the approach of winter, and to use every means to forward the growth of valuable hardwooded plants in order to have it somewhat firm and able to resist damp, and that as soon as possible.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

Owing to the dryness most work was held over, except a free hoeing of the surface, and digging and trenching all vacant

ground, to be ready for planting when rain comes, or we can obtain water. Frequent hoeing, even though there be few or no weeds, greatly helps to prevent the escape of what moisture is left in the soil. In ground which had been rather heavily cropped, we found scarcely a trace of moisture at the depth of 18 inches. Planting, without being able to water, was out of the question. We find all round here that Potatoes are beginning to grow again; the sooner they are taken up the better, as the tubers become hard and stringy when fresh ones are allowed to come from them.

FRUIT GARDEN.

Many trees, as Peaches on walls, are so suffering from these dry bright days that we would have soaked the roots if we could have done so. We may have to resort to some mode of shading to preserve the crop, but unless a change come soon all fruit will be smaller than usual. Trees in houses, whether in pots or otherwise, have been greatly assisted by slightly shading the glass with whitened water. We have been forced to apply it to almost every house, to enable us to do with as little moisture as possible. We have used gauze netting for ventilators, in some cases removing the ventilators—to keep wasps and flies out, but now, after doing this, few wasps are to be seen again, though for three or four days they were in myriads. Melons, as a rule, have been good this season, being none the worse, perhaps, of having had less of the syringe than usual. It must be pretty well put aside when water has to be carried from three to four miles.

ORNAMENTAL DEPARTMENT.

With a little picking flower beds and borders still look very well in places where Peas have been burnt up as if with a hot blast from a furnace, and even Cabbages blue-coloured and hard. With rain to refresh the grass, the flower garden will stand out the season. We are doubtful as to the results with another ten days of this weather. The lawns have neither been mown nor machined for a long time, except in the case of little pieces here and there, that were too long for the daisy knife to manage. It was altogether too dry for Daisies to show themselves, but Bents, Plantains, and the pretty yellow Lotus corniculatus would appear, and the knife soon settled them.

Walks.—These have needed little care this season, but we were apprehensive that they might trouble us in the autumn if it should prove damp and drizzly, and then walks are difficult to clean. We have had them all put in good order, which we generally do rather earlier in the season. The sides were neatly cut, the walks hard-swept, and then a slight sprinkling of salt was thrown all over them, followed by enough of fine sandy gravel passed through a half-inch sieve; the back of a rake was passed over this, and then they were rolled when dry. As soon as rain enough comes to wet the walks they will be swept to take out all inequalities, and when well rolled will give little more trouble through the autumn and winter. By adopting this plan we rarely break the surface of these walks, and in general they are dry, smooth, and pleasant to walk on in all weathers. The slight sprinkling of hard sandy gravel causes them to look bright and fresh, especially after they have been rolled when damp. But for that sprinkling we would not salt walks so late, as they would be apt to be damp, and even to adhere to the feet in winter. The slight sprinkling of sand above the salt neutralises that tendency, whilst it also insures the salt being equally absorbed instead of being washed to the sides. Salt when merely scattered over the surface acts most effectually when so scattered in dry weather. It is also the easiest way to apply it, and the salt is quite as effectual as when presented in a strong solution of hot or cold water, which we could not contemplate. Even in dry weather the salt will disappear in a few days. It is no ornament to the walks, however, so long as it remains white, and it does not do to traverse walks and lawns alternately. The slight covering of sand remedies both inconveniences; it also ensures a dry surface instead of a clammy one in winter.

Now is a good time to sow Mignonette for winter and spring blooming, Stocks for spring blooming, and many hardy annuals, &c., to be protected a little in winter. Such as Schizanthus, Collinsia, Clarkia, Nemophila, as well as Wallflowers, potted, come in useful for cut flowers in spring, and good pots of them in full bloom look very well. A fine specimen of Collinsia bicolor might grace any drawing-room.

Pinks, Cloves, Carnations, and Picotees.—We are rather late with cuttings of these this season. The better kinds of Carnations and Picotees do best layered if suitable "grass" can be had, but they strike freely enough as cuttings, and a cutting can often be obtained when a layer could not be made without

some trouble. Pinks and Cloves of all kinds may be struck now, either under hand-lights or in a frame, if just a little mild bottom heat be given them. They will do planted out in fresh sandy soil, with a little sand at the top. If at all doubtful, the best Cloves and Carnations might as well be put round the sides of a small well-drained pot, and the pot be plunged, for then there is the advantage that you can renew the mild heat if it be wanted. Where space in a frame can be spared, this plan involves far less trouble on the whole than layering.

No kind of cuttings can be more quickly made. It is seldom that a knife need touch them. We think that years ago we detailed the simple process, which also has the advantage of mutilating to the least possible extent the old plant. Proceed thus:—Take hold of the shoot that you are to take the cutting from in your left hand, to keep it firm and steady, and take the point of the shoot in your right hand near to the second joint, give a sharp pull, and out it comes at the joint cleaner and more neatly than ever you could cut it with a knife after much stripping of leaves. Sometimes a little film may be left at one side, and that should be removed with a clean knife. In general nothing whatever is wanted, but the cutting or piping will be in the best possible condition for planting. A clever lad will slip out these cuttings as quickly as one can write a letter in one of these words.

Propagating Bedding Plants.—This must often depend on circumstances. Where there are reserve gardens for cut flowers, it may be done early. We have not such a garden, and there is always a little reluctance to spoil the contour of a bed or border, which taking many cuttings from a small place is sure to do. On the same principle the question may be settled as to the advisability of taking large or small cuttings. Had we plenty of room for wintering, and other matters suitable, we would take off strong cuttings of Scarlet Geraniums, insert them at once in small pots, and winter them in these pots. We might save time at first by planting the cuttings in an open border, and then lifting and potting, but ultimately we should gain but little, and the plants struck in a border are likely to be more succulent than those struck in a pot. One advantage of large cuttings is, that provided some of the larger leaves are removed, they need little or no protection or shading, as there will be enough of moisture stored up in the cuttings to enable them to bear sun and air before roots are formed. Even light drooping does them little harm. We seldom, however, for reasons indicated, take large cuttings, and thus we break as little as possible the outline of the bed, and save a great many in little room in winter, but we give them a little help in spring. Some gentlemen looking at large plants in vigorous growth in beds would scarcely credit that these plants were cuttings from 1½ to 2½ inches in length last September. These we generally place thickly in pots and shallow boxes, preferring the latter, leaving them about 1½ inch apart. The cuttings when obtainable are chiefly short, stubby side shoots slipped off close to the scouter stems, and most of these cuttings, therefore, will have the point or axis of growth. With such small cuttings, especially of the variegated Geraniums, it is well to protect them at first with old sashes, mats, or calico, the last the best, until the base of the cuttings swell so as to be ready to protrude roots.

With such plants as Verbenas, Heliotropes, Pentstemons, Salvias, Iresines, Coleus, &c., we prefer the small side sheets as cuttings, and such plants as Verbenas we put in more closely than Geraniums, seldom giving them more room until spring, when they are cropped for more cuttings, and encouraged with weak manure-waterings. The most of these plants are the better of being placed under glass, kept close during sunshine, and, if near the glass, shaded. If from 20 to 24 inches from the glass they will not need shading if given a skiff from the syringe about midday. We like to get these at least partly in before we begin with Geraniums, as they always succeed best when struck cool—that is, in a cold pit or frame without any artificial heat. The heat of the sun during the day we neutralise by keeping them cool at night—by giving air then, the best of all securities against damping. From 6 or 7 p.m. to 7 or 8 a.m. the young cuttings will bear a little air well, and be all the more robust in consequence.

We frequently use small pots, as 60's and 48's, for Verbenas, and sometimes shift into larger pots when the cuttings are well struck, but we prefer wooden boxes averaging 3 inches deep for our main stores, and just of the size we can find wood to suit, but averaging a foot in width and 2½ to 3 feet in length. The pots are generally filled from a fourth to a third with drainage,

then rough nodules of fresh loam over the drainage, then finer light soil, followed by a surfacing of lighter still, with more sand. The boxes need no drainage. They are chiefly made in rough weather from rough packing boxes, or boards which have been merely sawn, not planed. The extra waterings, therefore, can escape quite fast enough at the sides. These boxes, if old, are well cleaned before being used, and old and new alike are well painted with fresh limewash. This is a great preservative against fungi, which otherwise are apt to attack rough wood in damp places. These boxes are easily moved from place to place, a matter of importance where much moving is to be done. A thin layer of rough nodules of the turfy soil is spread over the bottom of the box, very likely with the addition of a little charcoal, then a finer layer of sandy loam, followed by one finer still, with more sand in it, and a little charcoal dust at the surface, the whole pressed down moderately firm. If at all moist, we put in the cuttings before watering, and then the watering settles the soil firmly about them.

From years of experience and observation we can safely state that the health and robustness of the cuttings and young plants depend more on the freshness of the soil than on its richness. It is safer to aid the roots with weak manure-waterings than by mixing crude manure with the soil. We have seen fine heaps for such cuttings made from old Cucumber beds, decayed leaves, dung, and plenty of sand, but the cuttings often turned out very unsatisfactorily. We prefer sweet fresh sandy loam, and made so if it cannot be found naturally. This we pass through sieves to obtain the requisite qualities—rough, but not in pieces much larger than beans for the bottom, lighter and finer above, and the top layer finest of all. This takes very little more time. All half-rotten leaves or dung for the bottom we discard, as they are the fruitful source of fungi and decay at the roots. We do not object to a little sweet, thoroughly decayed, well-aired leaf mould, finely sifted, mixed with the upper layers, along with a little fine charcoal dust, but if the leaf mould be not sweet and well aired beforehand, we would rather be without it altogether. We have known hundreds and thousands of struck cuttings ruined, because the propagator placed a good handful of half-decayed tree leaves over the drainage. Of course, they would often do no harm, but very frequently they become dangerous as a regular feeding ground for fungi.—R. F.

TRADE CATALOGUES RECEIVED.

F. and A. Dickson & Sons, 106, Eastgate Street, and Upton Nurseries, Chester.—*Catalogue of Dutch Flower Roots, &c.*

W. Cutbush & Son, Highgate.—*Bulb Catalogue for 1870.*

H. Curtis & Co., Devon Rosery, Torquay.—*Descriptive Catalogue of Selected Roses.*

Dick Radcliffe & Co., 129, High Holborn, London, W.C.—*Autumn Catalogue of Dutch Bulbs, &c.*

Downie, Laird, & Laing, Stanstead Park, Forest Hill, London, and 17, South Frederick Street, Edinburgh.—*Descriptive Catalogue of Dutch Flower Roots.*

TO CORRESPONDENTS.

* * * We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

Books (*Constant Reader*).—There is no such book. If you read what Mr. Moore said at Oxford, which is reported in last week's Journal, and Dr. Hogg's address, which you will find at page 84, you will meet with all you require to know. (*Henry*).—A new and very much enlarged edition of the "Fruit Manual" is now in preparation, but it will not be published until a few months hence.

DOUBLE GERANIUM CROWN PRINCE.—Mr. Cannell, of Woolwich, has sent us blooms of his new double Geranium Crown Prince, which was awarded a first-class certificate at the last meeting of the Floral Committee, showing that the colour is much more intense than that of Madame Lemonie, while the plant has the advantage of not being so gross in habit as most of the double varieties.

ABNORMAL CARNATION (*A. B. A.*).—The structure of your Carnation is much the same as that of the Wheat-ear Carnation, wherein all the floral organs assume the form of bracts. The difference between yours and the Wheat-ear is, in the latter the spike is elongated like an ear of Wheat, whereas in yours it is contracted in the form of that of the Canary-grass. You will find all these curious vegetable forms very ably treated on in Dr. Masters's "Vegetable Teratology," a work which every gardener ought to possess, and which we shall take an early opportunity of describing.

GRAPES SHANKING (*G. Musk*).—The Grapes are what are called shanked, a disease generally attributable to bad soil, overcropping, and other conditions, but of which we believe the cause is little understood. We have seen Vines grown in pots and not overcropped, but well treated, produce shanked fruit.

GRASS LAWN (*H. A. E.*).—If you break up your present lawn and sow it down now, it will not be sufficiently solid and thick for you to play croquet on it next summer. The best way will be to take up the whole, select the best turf for relaying, and procure good new turf to make up the quantity required. When your turf is up procure some heavier soil to mix with the staple, and add also a liberal dressing of cow manure, potash salts, and bones. Next season you will have a good turf. This should be done after this dry weather has gone. (*Grass Plot*).—As you object to re turf your lawn, you had better clear out all those patches where the grass has failed, and sow them with a mixture of lawn grasses, which you can procure from any seedman. In autumn top-dress the whole with well-rotted manure, or in February give a dressing of guano and superphosphate in equal proportions.

PEACHES NOT SWELLING (*J. Green*).—It is not from any effect of the sun plus, but from the dry season, that your Peaches have not grown so large. If you had opened a trench round the roots and given them a good watering, in all probability the fruit would have been much larger than they are.

LEAF-SHAPED ROSE PETAL (*H. D. Nash*).—It is simply a proof of the origin of the petal from a leaf. It is a curious freak.

GLASS WALLS (*F. Fane*).—Apply to Mr. Beard, Victoria Works, Dury St. Edmunds—that is, if you mean his glass walls, and not those of "OBSERVER."

NAMES OF PELARGONIUMS (*N.*).—We cannot undertake to name florists' flowers. The French Marigolds are good; we have seen better-marked and larger. The Pelargonium sport is of no value.

CRICKETS ATTACKING NECTARINES (*G. S.*).—The insect gnawing the fruit of Nectarines in your orchard house is the common house cricket, which often in hot summers quits the kitchen hearth and takes up its quarters in congenial situations out of doors.—I. O. W.

PYRETHRUM SEED SOWING (*Subscriber*).—The Golden Pyrethrum seed may now be sown in a sheltered situation in light sandy soil, and the plants may be taken up in October, potted, and wintered in a cold frame or greenhouse. They will be fine for planting out in spring. The Golden Pyrethrum, however, is quite hardy, and the seedlings may be pricked off about 3 inches apart in October, or even as late as November, on a warm border of sandy soil, and they will form good plants for planting in April or May.

FERNS FOR LILY HOUSE (*An Amateur*).—We do not understand what you mean by a Lily house, unless it be a house for aquatic plants, in which case any or all of the exotic Ferns introduced would succeed if it were not that they require shade, which aquatics do not. If you can afford shade to the Ferns without making the house too gloomy, or can do so without shading the aquatics, then you may have stove or greenhouse Ferns, according to the temperature of the structure.

DOUBLE PETUNIAS LOSING COLOUR (*H. E.*).—The double white and purple-blotched Petunias lose colour through decreased vigour in the plants. We advise you to take off cuttings of the young growths now, and strike them in a cold frame or in a hotbed; when well rooted pot them off singly in small pots. To spring shift the plants into larger pots as required, using a compost of two parts turfy loam, one part leaf soil, and one part old cow dung, with a free admixture of sand and charcoal. Keep them in a cool, airy position near the glass, and safe from frost. The flowers will be finer and the foliage larger than on old plants.

POTTING SHOW PELARGONIUMS (*Idem*).—The plants should not be placed in their blooming pots at the first potting after being cut down. Shake them out—that is, remove all the soil from their roots, and place them in pots large enough to hold the roots without cramping. When the plants have made fresh roots and need repotting, as they do when the roots are matting round the sides, they may be put into their blooming pots.

CLEMATIS FOR NORTH WALL (*Idem*).—We have not found the new Clematis Jackmanni, &c., succeeding on a north wall, but C. Vitalba, C. Frankfurtensis, and C. Viticella do tolerably well; the first-named we have seen very fine.

EVERLASTING FLOWERS (*Twelve-years Subscriber*).—We do not think if the words in which the prize is offered are strictly interpreted, that you could exhibit dried Laguruses and other ornamental Grasses in "a collecting of Everlasting Flowers." The heads of such dried Grasses are only a part of the flowers.

Figs (*R. H. W.*).—We propose doing as you suggest, but we must have all that our correspondent has to say on the subject before we decide.

VARIOUS (*Kittie*).—The common wood Hyacinth is the Scilla non-scripta of botanists, the Harebell of common nomenclature. Very little frost and damp destroy the Gaspalum lanatum. Your proposed planting will do very well if you have the crimson or red Tom Thumb Tropaeolum. The latter will want picking off superfluous leaves and seeds as they come. To raise Echeverias for edgings next year, sow at once, merely covering the seeds, prick off the seedlings as soon as sown, and keep airy and rather dry in winter.

SULPHUR ON HOT-WATER PIPES (*A. B. C.*).—If you put the sulphur on the hot-water pipes, either by making a paint with water, or milk, or lime to make it adhere better, the Grapes will not be injured if the heat of the pipes be not above 100°, and a little air be given at the top of the house early in the morning.

CUCUMBERS DAMPING OFF (*Tilney*).—Thrips and neglecting to fertilise the flowers will not cause the fruit to go off at the end. It arises from the growth not being free enough, owing to a deficiency of bottom heat, or a cold and moist atmosphere at top. We think a little more bottom

heat with a brisk top heat would set all right. Vegetable Marrows are indifferent bearers this year, owing to the dry weather.

WOODLICE IN CUCUMBER FRAME. (*M. J. J. J.*)—Place a boiled potato wrapped up in a little hay in a small flower-pot, and lay the pot on its side near the haunts of the woodlice. A number of such baits put down at night, and the contents emptied in the morning into a bucket of boiling water, will considerably thin the woodlice.

PEACHES DISEASED. (*Mrs. W. F. Knutshill.*)—The Peaches are suffering from gum, and probably the trees are also. The cause of this is the roots of the trees having got into an ungenial soil. In autumn let the roots be uncovered and examined, and as some of them will in all probability have thrown down tap roots into the subsoil, let these be cut off, and all the remaining roots encouraged near the surface.

MESSEMBRYANTHEMUM CULTURE. (*H. T.*)—The culture of these plants is not difficult. They require to be grown in a compost of equal parts of light turfy loam, sandy peat, lime rubbish, charcoal or broken pots, and silver sand. If the loam is poor, one part of old cow dung may be advantageously added. Mix the whole well. The pots must be well drained. Small pots only are necessary, or rather they should be small compared with the plants. Put in spring, or when the plants begin to grow. Propagate by cuttings laid on a shelf in the sun a few days to dry at the base, and then insert them in the above compost, with an equal quantity of sand added to it. In summer they succeed out-doors on rockwork in an open, very sunny situation, and are very suitable as window plants for warm south aspects. In winter they need to be kept secure from frost, and ought to have no more water than will prevent the stems and leaves from shrivelling. When growing they require a plentiful supply of water, at other times dryness. Some of the best are *M. densum*, *M. rotundum*, *M. strictum*, *M. conspurcans*, *M. falcatum*, *M. rebratum*, *M. spectabile*, *M. cordifolium*, *M. variegatum*, *M. coccineum*, *M. maculatum*, *M. falcatum*, *M. echinidum*, *M. album*, *M. cylindricum*, *M. bicolorum*, *M. palmatum*, *M. leve*, *M. aurantiacum*, *M. spinosum*, *M. aureum*, *M. barbatum*, *M. polyanthum*, *M. tuberosum*, *M. incurvum*, *M. denticulatum*, *M. blandum*, *M. difforme*, *M. heterophyllum*, *M. cocciniferum*, and *M. inclaudens*. If planted out in summer they will need to be taken up in autumn, potted, and wintered in a house with a temperature not below 35°, nor higher from fire heat than 45°, keeping them near the glass and dry. They are not Everlastings.

PEACHES. (*J. W. Popham.*)—We do not know the Dymond Peach, and never heard of the name. The grower who sold it to you ought to be able to give some account of it. The variety which he supplied you with for Royal George, may probably be Early Victoria, as that is a dark-coloured Peach, and with glandless leaves.

SHOOTS OF VINE DYING. (*B. C. H.*)—This decay and the Grapes shanking, indicate that the roots of the Vine do not supply a sufficiency of sap. They have either descended into a bad subsoil, or they have not a good supply of moisture and nourishment. Give an abundant watering once a week with tepid weak liquid manure, and mulch the surface of the border.

NAMES OF PLANTS. (*Julia.*)—*Achillea Millefolium.* (*D. B.*)—*Cuscuta Trifolia.* (*M. Catterbeck.*)—*Catappa sylvatica.* It does not bloom until of a large size. (*J. S.*)—1, *Asplenium bulbiferum*; 2, *Neprolepis exaltata*; 3, *Urtica erecta* all three for 4, *Platyoma rotundifolia*; 5, *Haltimium elegans*; 6, *Achillea cymosa*; 7, *Achillea*—*Atriplex portulacoides* of Linnaeus, now frequently referred to the genus *Obione*; 8, *portulacoides* of Moquin. (*M. A.*)—Without seeing the flowers of your scented-leaved *Pelargonium* it is impossible to say if it is better than existing named varieties. The leaf you sent will be that of *Achillea Millefolium*. A piece of a Fern frond enclosed with your letter is *Adiantum bipidulum.* (*J. G. S.*)—No. 4 is *Lysimachia Nummularia*, and 5 *Lantana vulgaris* fl. pl.; No. 3, *Gnaphalium marginatum*. The rest in a future issue. (*D. A.*)—1, *Scilla Liliata*, apparently a *Melissa*; specimen in this and the next far too imperfect; 2, a *Habrothamnus* or *Cestrum*; 3, *Cassia levis*. Send better specimens when you make inquiry again. (*E. P.*)—*Palma adiantifolia.* (*S. B.*)—1, *Lactuca dilatata*; 2, *L. tuberosa*; 3, *Lemna spicata*; 4, 8, and 9, all forms of *Athyrium filix-foemina*; 5, *Lactuca Indivisa*; 6, 1, *Polypodium calcareum*; 9, *Polytrichum Lomatites.* (*A. Suber.*)—1, *Bugusia* (or *Complobotrys*) *refugens*; 2, *Eranthium leucocarpum.*

POULTRY, BEE, AND PIGEON CHRONICLE.

A TRIP INTO GLOUCESTERSHIRE AFTER POULTRY.—No. 1.

THERE are many charming bits of scenery in England which are, as yet, to be lying away from railway stations, scarcely known so much as they deserve to be. Or, if they have a railway, it is but an unsatisfactory thing, a single line, which in slowness, perhaps, is meant to be a pleasing reminder of old coaching times; sometimes, too, it comes to an end at apparently nowhere particular, and, perhaps, at a very small station, where two men are yawning, thus making a pretence of doing something, or a lively boy, the only vigorous inhabitant of the district, is whistling a tune which was a popular one ten years ago. But there are often charming bits of scenery close by; one such it was my happy lot to see last week in the district lying near Dursley, in Gloucestershire. Although the Romans left their mark about Dursley, yet something more ubiquitous even than that conquering power gave many of the names to the places around—namely, pasturage and a shepherd's life. Thus in Dursley we have deer-lic; the next parish is Uley—i.e., Ewe-lic; the next Otten, from old-pan; and Lampen Hill from lamp-pan. Doubtless, the shepherds gave the names, and all, save the first, tell of their quiet pasture life.

The valley of Uley is, indeed, a choice piece of scenery—high hills covered with beech trees, there a natural growth; then in contrast to the thick woods, one here long hill, Uleybury, so unlike its well-clothed brothers, and a valley with wood—perhaps too much—and, marvellous this dry season, a glimmer of water and perfectly green grass. Place in this scenery a couple of Gothic churches, a picturesque mansion or two, one smaller, yet its ivy, and its stone tiles, and its air of comfort and refinement, make each traveller instinctively say, "What a nice old place! Who lives there?" I check rein before that house, where lives and has long lived a brother cleric, a brother poultry fancier, and a brother rosarian—a threefold binding-chord. Mine is a second visit, so I know what to expect and whom to look for—the kindly parson himself, his wife, and oh, marvellous! his small family. Then there will be his man Hosea (a parson's man should have an Old Testament name). Then there will be the gardener, apparently given-up entirely to roses, though there is a cabbage here and there; there will be the Dorkings, and the Game Bantams; there will be the selecting and packing-off the poultry for the coming show; there will be the master taking a last loving peep and saying, "I wonder what prizes I shall get—perhaps none at all, for those wretched judges may not see the beauties of my beauties, and yet (here hope sparkles in his eye), I think, that Dorking cockerel will do something." (N.B., He did.) There will be Hosea, gravely and cautiously putting the show roses in their case, dipping the moss in the water, filling the glasses, sorting the roses, and thinking they will get a prize. Hosea was right, they did.

Wednesday morning we start from the valley of Uley for Stroud, driving—that pleasantest way of getting through a short journey in fine and warm weather. Soon we emerge from the lovely valley and begin to climb that long steep hill, Lampen Hill, with a forest of beech trees on our right, and a dip of many hundred feet on our left. Pity we cannot, as far as locomotion is concerned, do away with all hills. Look at the wise Londoners, they only had one hill, Holborn Hill, and they have done away with that. Railways also know no hills; in fact, hills, except to look at, are sad nuisances. The late Mr. Cobden once talked of crumpling-up Russia as he could, suiting the action to the word, crumple up a newspaper, which, perhaps, contained an article against him. I wished he had lived to lower all the hills by filling up the valleys in the roads.

Having at long-last climbed that tedious hill, we come into the stone-wall country, leaving a little on our right Kingscote Park, which has been in the hands of the Kingscotes for nearly a thousand years. A Nigel de Kingscote came over with the Conqueror, and Colonel Nigel Kingscote now represents, as his forefathers did in many generations, a division of Gloucestershire.

Further on, the country improved until we get among decidedly pretty scenery. At Horsley, there stands an empty unused jail, which ugly building though it be, we may look at with pleasure, as it is a happy indication of improved morals. But we get on to Nailsworth, and still the scenery improves, passing Amberley, which gives a title to Earl Russell's eldest son. Reaching soon Woodchester, we are, I suppose, in the golden valley of Stroud, and beautiful it is; not a close-shut-in valley as some of our North Wilts combs are, nor yet a wide valley with hills so far off as scarcely to come into the landscape—wide, and not too wide, with hills well-shaped and well-wooded, indeed the whole of the golden valley has a park-like appearance, so well-grown is the timber. Among the scattered hamlets one caught sight now and then of a fine gable, or ornate house of the Queen Anne date, but factories are also in the valley, which, though indicating wealth and a comfortable livelihood to many, add no beauty to the scene. Art put alongside of Nature must not only, in order to add to the beauty of the landscape, be high art, but must be altered and improved by the hand of Nature, an alteration and improvement stretching over many years before it harmonises with Nature. Thus, how a new monument, or a new church smites the eye; but let the church tower or spire meet the winds of Heaven for years and years and get well weather-stained, how (as witness hundreds of old churches) it adds to the beauty of the view; but new factories can never be improved. This train of thought reminds me of Shakspeare's words in the Winter Tale—

"Yet nature is made better by no mean,
But nature makes that mean: so'er that art
Which, you say, adds to nature, is an art
That nature makes,—the art it elf is nature."

derton & Scholes, Hollinwood. *hc*, T. Walker, jun. *Silver-spangled*.—1 and Cup, H. Beldon. 2, H. Pickles. *Chickens*.—1, H. Pickles. 2, H. Beldon. *hc*, J. H. KEIGHLEY AGRICULTURAL SOCIETY'S POULTRY SHOW.

This was held on the 19th inst. The following are the awards:—

COCHIN-CHINA. *Buff*.—1 and 2, W. A. Taylor, Manchester. 3, T. Stretch, Ormskirk. *Chickens*.—1 and 2, W. A. Taylor. 3, C. Sidgwick, Keighley. *hc*, C. Sidgwick; T. Stretch. *Any Colour*.—1 and 3, W. A. Taylor. 2, H. Beldon, Gostock. *hc*, T. Stretch. *Chickens*.—1, W. A. Taylor. 2 and 3, C. Sidgwick. *c*, J. H. Dawes, Birmingham. **SPANISH** (Black).—1, C. W. Brierley, Middleton. 2, H. Wilkinson, Farby. 3, H. Beldon. *Chickens*.—1, C. W. Brierley. 2, H. Beldon. 3, J. W. Cannon. *hc*, J. J. Booth. **HAMBURGERS**.—*Silver-pencilled*.—1, H. Beldon. 2 and 3, H. Pickles, jun., Earby. *Chickens*.—1 and 2, H. Beldon. 3, H. Pickles, jun. *Silver-spangled*.—1 and Cup, H. Beldon. 2, H. Pickles, jun. *Chickens*.—1, H. Beldon. 2, H. Pickles, jun. 3, T. Fawcett, sen., Baildon. *Golden-spangled*.—1, J. Newton. 2, H. Pickles, jun. 3, H. Beldon. *hc*, W. Driver, Keighley. *Chickens*.—1, W. Driver. 2, T. & W. Walker, Denton. 3, C. E. Palmer, Highthorn, Warwick. *hc*, H. Pickles, jun. *Golden-pencilled*.—1, H. Beldon. 2, H. Pickles, jun. 3, S. Smith, Northwarren. *Chickens*.—1, H. Pickles, jun. 2, H. Beldon. 3, T. Kinder, Middlethwait. *Black*.—1, H. Beldon. 2, T. & W. Walker. 3, H. W. Bingsworth, Ilke. *Chickens*.—Cup and 3, C. Sidgwick. 2, S. Haldiffe. *hc*, J. Cockeroff, Hawkecliffe, Keighley. **PORTRAI**.—1, 2, and 3, H. Beldon. *Chickens*.—1 and *hc*, H. Pickles, jun. 2, H. Beldon. 3, J. Bowker, Keighley. **DORINGS**.—1 and 3, T. Briden, Earby. 2, W. A. Taylor. *Chickens*.—1, T. E. Kell, Wetherby. 2, T. Briden. 3, J. J. Waller, Kendall. *Game*.—*Red*.—Cup, C. W. Brierley. 2, T. & J. Robson, Bishop Auckland. 3, W. Spencer, Tharworth. *Chickens*.—1 and 2, J. Carlisle. 3, H. Jennings, Alton. *Any other Variety*.—1, C. E. Farley. 2, H. M. Jubb, Hull. 3, T. & J. Robson. **T. SURFLEIGH, HALL**.—1, H. Beldon. 2, H. Pickles, jun. and Co., Keighley. 2, M. Jowett, Clayton. 3, Green & Sutcliffe, Queensbury. **ANY OTHER DISTINCT BREED**.—1, J. H. Pickles, Birdale, Southport. 2, H. Beldon. 3, E. Leech, Rochdale. *hc*, W. Wildy, Cosham. *Chickens*.—1, E. Leech. 2, W. O. Quibell, Newark. 3, W. A. Taylor. **BANTAM**.—*Game*.—1, G. Anderton, Accrington. 2, W. F. Entwisle, Cleckheaton. 3, T. Dyson. *hc*, F. Steel, Halifax. *Chickens*.—1, G. Noble. 2, W. F. Entwisle. 3, H. Greenwood and Buckley, Accrington. *hc*, F. Steel; W. F. Entwisle. *Any other Distinct Breed*.—1, J. W. Cannon. 2, S. & R. Ashton, H. Beldon. *Chickens*.—1, H. Beldon. 2, T. C. Harrison, Hull. 3, W. H. Robinson, 1 oncle. **DUCKS**.—1, E. Leech. 2, J. Clayton. *Aylesbury*.—1 and 2, H. D. Leech. 3, T. Wilson, Farnhill. *Any other Variety*.—1, J. Dixon, Bradford. 2, C. W. Brierley. 3, T. C. Harrison. *hc*, S. & R. Ashton; J. Dixon. **GEESSE**.—1 and 2, E. Leech. 3, Rev. G. Huxley, Stillingfleet. **SELLING CLASS**.—*Cock*.—1, H. Pickles, jun. 2, J. Berry, Silsden. 3, H. Beldon. *hen*.—1, J. L. Booth. 2, H. Wilkinson. 3, J. Berry. *hc*, H. Pickles, jun.

PIGEONS.

Cup for best pen, E. Horner, Harwood. **PORTER OR CROPPER**.—*Cock*.—1 and 2, E. Horner. 3, J. Hawley, Bingley. *hen*.—1, W. Harvey, Sheffield. 2 and 3, J. Hawley. 3, E. WHITBY POULTRY SHOW.

We published last week the awards made to the poultry and Pigeons at the Whitby Agricultural Society's thirty-sixth annual Show. The weather being extremely fine and the visitors very numerous, the receipts at the gates were much greater than at any former Show. The arrangements were everything that could be desired. The *Dorkings* did not form a large class; the prize chickens were very good. Many of the *Spanish* were in deep moult; the first-prize chickens, however, were good. In the class for Red *Game*, Mr. Julian was first with a very good pen of Black Reds; and Mr. Robson, of Bishop Auckland, second with an excellent pair of Brown Reds. The two pens of *Duckwings* belonging to the same gentleman were also first-rate. Of

Brahmas there was a large entry, but many of them were much out of condition. Some of the chickens were of great merit. The *French fowls* were tolerably numerous, and the two prize pens of great merit. Most of the *Hamburgh* classes contained some good birds, but the entries were not so numerous as we should have wished. The *Ducks* and *Geese* were well represented; and all the classes of *Pigeons* contained many first-class specimens.

The local cups for the best pen of chickens, of the large breeds, was awarded to Mr. Readman, for *Cochins*; that for *Game* or *Hamburghs*, to Mr. Webster; and for *Ducks*, to Mr. Barn, for a good pen of *Black East Indian*.

PENISTONE POULTRY SHOW.

The seventeenth annual Show of poultry took place at Penistone on Thursday last, upon the admirably adapted grounds belonging to Mr. Unwin. There may have been years when the number of entries have been larger, but the different classes have never been better represented. The poultry included some of the finest birds in the kingdom. The prize for *Dorkings* was carried off by a very fine pen. *Spanish* were well represented. The *Polands* shown were remarkable for their excellent quality. Of *Hamburghs* there was a large display, and finer birds could not be found. The *Game* classes caused some excitement, the several kinds shown being admirable. The competition between Mr. C. Chalouner and Mr. F. Sales was exceedingly keen. The *Cochin-Chinas* were poorly represented, owing to most of this class of birds being out of feather. However, Mr. Harvey showed one excellent pen.

DORINGS.—1, Hon. H. W. Fitzwilliam, Wentworth Woodhouse. 2, W. Harvey, Sheffield. *Chickens*.—1, W. Parkin. **SPANISH** (Black).—1 and 2, Burch & Boulter, Sheffield. *Chickens*.—1, E. JUDGES.—Mr. William Wood, Sheffield, and Mr. Thomas Wilkinson, Holmfirth.

DEANE AND BOLTON POULTRY SHOW.

This was held on the 18th inst., at Deane, near Bolton, in connection with the Agricultural and Horticultural Show, and the day being fine there was a large attendance of visitors. The following are the awards:—

SPANISH.—1, F. & C. Howarth, Newfield, Haslingden. 2, C. W. Brierley, Middleton. **DORINGS**.—1, C. W. Leaverley. 2, J. Watts, King's Heath, Birmingham. *hc*, J. Stott. **GAME**.—1 and 2, C. W. Brierley. *c*, J. Wallas. *Cock*.—1 and 2, C. W. Brierley. *hc*, J. Wallas, Deaton. **COCHIN-CHINA**.—1, J. Stuch, Tamworth. 2, C. W. Brierley. *c*, G. Anderton, Accrington. **BRAMS**.—1 and 2, J. H. Pickles, Birby, Southport. **HAMBURGERS**.—*Golden-pencilled*.—1, T. Wrigley, jun., Tonge Hall, Middleton. *Silver-pencilled*.—1 and 2, J. Platt, Deane. *Golden-spangled*.—1, T. Bolton, Handforth. *Silver-spangled*.—1 and 2, J. Fielding, Newchurch. **POLANDS**.—1 and 2, P. Unsworth, Lawton, Newton-le-Willows. **ANY OTHER VARIETY**.—1, C. W. Brierley. 2, S. H. Stott. **BANTAMS**.—*Game*.—1, T. Sharples, Forest Bank, Rawtenstall. 2, G. Anderton, *hc*, T. Sharples; J. Wallas. *c*, N. Cook, Choultun; J. Howarth, Holcombe Harriers, Colburnton. *Any other Variety*.—1, N. Cook. 2, S. & R. Ashton, Rochdale. *hc*, N. Platt, Deane. **BURNS**.—*Aylesbury*.—1, E. Leech, Rochdale. 2, S. H. Moore. **EXTRA CLASS**.—1, Withheld. 2, D. Bromley (Blue Carriers).

JUDGES.—Mr. S. Fielding, Thretham, and Mr. T. S. Ridpath, Outwood Hall, Hanforth.

WOODSOME POULTRY SHOW.

The Woodsome Society's fifteenth Show was held on the 17th inst. The arrangements were good, the birds well attended to, and the exhibitors treated with the utmost courtesy.

Dorkings are neglected in this part, and there were no entries, and of *Spanish* and *Cochins* there were very few specimens. *Game* were adult birds, and not in the finest bloom, though good in hand. Of *Brahmas* there were some good specimens, the first-prize pen being in excellent order. The second-prize birds were better in marking, but out of feather. The *Hamburghs* were all good. In the *Game Bantam* class the competition was very close; the awards were made to *Black Reds*. In the class for any other variety of *Bantams*, *Blacks* were first, and *Japanese* second. The *Roman Ducks* were large, and the winners correct in points, though some of the rest were bad in head.

Of *Pigeons*, the best Carriers were a good pair of Duns, and two winning Pouters were good in limb and feather. Fantails were of but moderate quality, as also the Barbs, but the Trumpeters were good.

The *Rabbit* classes contained some good specimens, notably the Lop-ears, and a handsome Silver-Grey Buck.

SPANISH.—1, H. Beldon, Goltstock. 2, H. Staden, Woodsome Lees. COCHIN.—CHINA.—*Cinnamon or Buff*.—1, H. Beldon. *Any other Variety*.—1, J. White, Whitley Neighbour. 2, H. Beldon. JUDGE.—Mr. E. Hutton, Pindsey, Leeds.

WHITBY CANARY SHOW.—Was it not Dickens who, at the close of a preface, said with reference to the familiar cover in which the monthly parts of *Lis* works appeared, that he would some day put forth his "two green leaves" again? Whitby, the first Show of the season, has put forth its two green leaves, and I hope it is in the hands of all fanciers. It is an excellent schedule containing nineteen classes of Canaries, three of Mules, and two of foreign birds, for open competition, exclusive of district prizes. The Show is advertised for September 13th—rather early it is true, but it is held in connection with the flower show; and I can assure exhibitors that, apart from the great care and attention bestowed on the birds (which of itself is one distinctive feature of the Whitby executive), they will be seen by a concourse of visitors such as they will not, probably, greet again on this side of the Palace Show. Now, sire, what kind of a season have you had? Who is to the front this year? Let us see what you have moulted through for Whitby, and may the best man win.—W. A. B.

A HUNGARIAN METHOD OF CONTROLLING THE FERTILISATION OF THE QUEEN BEE.

The following article from the pen of Mr. A. Sémlietz is translated from a recent number of the German "Bee Journal":—

"Some time ago I was informed by the Chevalier de Azula that Mr. Johann Dax, of Güns, Hungary, had a method of insuring the fertilisation of a queen bee by any drone which he chose to select, and under his own immediate supervision. He stated that Mr. Dax excised a royal cell the day before its occupant would hatch out, and placing it in a cage permitted the young queen to emerge therein. She was afterwards transferred with a few workers to a suitable receptacle, and a selected drone being introduced, fertilisation was speedily accomplished.

"Following these instructions I performed several experiments last spring, but was in every case unsuccessful. Having occasion early in the autumn to proceed to Penkafeld, in Hungary, I resolved to extend my journey to Güns. Here I found Mr. Dax, who received me cordially and imparted much interesting information collected by him in the course of forty years' practical experience in bee-culture, besides allowing me to peruse a manuscript treatise embracing his observations and opinions, under the head of 136 questions and answers, forming literally a bee-keeper's catechism.

"It follows that the pure fertilisation of queen bees, and the best means of securing it, soon became the subject of conversation, and he unreservedly described his mode of accomplishing that object. As he generously allows me to make this information public, I now do so for the benefit of bee-keepers generally. The importance of the discovery, if it should prove reliable, induces me to publish it at once, although I should have preferred testing it first more thoroughly myself. The few experiments which I have been able to make failed, as it seems to me, only because the weather was so cold that I could

not prevent the embryo queens from becoming chilled in their cells; but that it is possible, by using the requisite precautions to procure the fertilisation of queens in the manner described by Mr. Dax, I consider unquestionably true. I now proceed to details.

"We require for our purpose in the first place, an ordinary pipe cover made of very fine wire. This is fastened to a small piece of wood less than a quarter of an inch thick, and thus becomes a regular queen-cage. The wood must, however, be sufficiently large to entirely cover the feeding-hole at the top of the hive, and must also have a circular aperture which will permit a queen cell to pass easily. Another thin bit of wood is also required, to which a royal cell is fastened by means of melted wax, and this, being laid on the queen cage with the royal cell passing through its central aperture, closes it entirely. We next require a piece of perforated zinc 6 or 7 inches square, and lastly a glass box 6 inches square by 7 inches high. This is entirely open at the bottom, and has small openings at the top for ventilation, as in a lantern. Through one side of the frame of this glass case is passed a pointed wooden skewer, on which we can easily hang a bit of honeycomb. These are all the materials required.

"If a hive contain many royal cells we must note the date on which each becomes sealed over, and on the seventh day a queen cell must be cut out and fastened with a little wax to the covering board, which must be put over the opening of the queen-cage with the cell projecting inside, taking care that sufficient space is left to permit the queen to crawl out. We then open the feeding-hole at the top of the hive from which the cell has been taken, and put the queen-cage over it, allowing it to project into the hive as far as the wood to which it is fastened will permit. A piece of paper should then be pasted over all, so that no heat may escape, and a blanket may be laid upon this. By raising this blanket and the bit of wood to which the cell is attached we can readily ascertain whether the queen has emerged from it or not. We then wait until the fourth or fifth day, or, in short, the first fine day after the third, which is the day on which queens usually take their wedding-flight. The little cage is now raised with all the bees which adhere to it, the feeding-hole covered with the perforated zinc, and the glazed box, which must be furnished with a bit of honeycomb, placed on the top. The bees and queen are then introduced through the ventilator at the top into the box to the number of at least one hundred, and if those adhering to the cage are not sufficient the perforated zinc must be slightly drawn back until enough have ascended. The glazed box is then darkened, and between the hours of eleven and three a drone is added, when you may watch their intercourse. If this does not occur on the first day, which, however, is generally the case, before three o'clock, it will take place the next day about the same time.

"Mr. Dax assures me that having tried this process many times, he has almost always succeeded with the first drone, but that the second never failed.

"In addition to the undoubted veracity of Mr. Dax himself there are other good reasons for presuming that a properly conducted experiment would ensure a successful result. Why should not fertilisation occur within the hive itself? Because in the crowded condition of the colony it evidently could not be effected without a disturbance and commotion endangering the life of the queen, and under these circumstances it has been provided that natural instinct should compel the queen to leave her hive for this purpose. Even if the bee-keeper should interfere by catching, confining, and removing the queen, she would still be in a state of alarm and endeavour to effect her escape and return to the hive—excitement and distress subduing every other passion or natural impulse. Whether a queen thus removed be liberated in a roomy chamber and permitted to fly amidst workers and selected drones, or allowed to take wing in the open air, restrained only by a silken filament, the desired result will rarely be attained; but under the treatment prescribed by Mr. Dax she becomes neither alarmed nor excited, being born in a state of confinement, and when permitted to mingle with a few workers she feels free and at her ease, and readily yields to her natural impulse to provide for the increase of the little colony. If then a mature drone be introduced, fertilisation is almost certain to follow, because from the small number of workers present (clustered also for the most part on the inserted honeycomb), no interference or commotion need be apprehended. These are the reasons which induce me to look with confidence for a successful result."

The above process certainly appears by far the most likely of any that have yet been devised to secure the desired end, and I

much regret that it is now too late in the season for me to submit it immediately to the test of experiment.—A DEVONSHIRE BEE-KEEPER.

THE BIGGEST PIE ON RECORD was made at Lowther Castle, in Westmoreland, in the year 1762, and was sent up as a present to the King. It contained 2 geese, 4 ducks, 2 turkeys, 4 wild-fowls, 1 wild goose, 6 wild ducks, 3 teal, 2 starlings, 12 partridges, 15 woodcocks, 2 guinea-fowls, 3 snipes, 6 plovers, 3 water-hens, 6 widgeons, 1 curlew, 46 yellow-hammers, 15 sparrows, 2 chaffinches, 2 larks, 3 thrushes, 1 field-fare, 6 pigeons, 4 blackbirds, 20 rabbits, 1 leg of veal, half a ham, 3 bushels of flour, 2 stoues of butter. The whole pie weighed 22 stone. This must have been the original pie commemorated in the nursery rhyme—

"When the pie was opened
The guests began to sing
'Is not this a dainty dish
To set before the king?'"

—(Food Journal)

OUR LETTER BOX.

BREEDING TURKEYS AND GESE (*A Constant Subscriber*).—Most breeders prefer early-hatched young hen Turkeys, and seldom keep them after the second or third year. Young cock Turkeys are preferred, especially if the hens are old ones, but there is little objection to using a three-year-old bird; we do not advise an older. You may use very old Geese, but you want fresh and young ganders. We have known a Goose doing good duty at eight years old, and we have been told of some that were positively patriarchal. We do not advise you to keep Aylesbury Ducks after the second year—that is, after breeding from them two seasons. None of the non-sitters will last so long as those that become broody. We advise the Toulouse as the best breeding Geese; but as they do not sit we say of them, and of Aylesbury Ducks, Renew your stock frequently.

LEGS OF PILE GAME FOWLS (*H. L. C.*).—There is no fixed colour for the legs of Game fowls, but in almost every instance willow are preferred. Some, however, like yellow for Piles, especially in the Worcestershire district. Of late years willow and lead-coloured seem almost to have monopolised the strains. White, yellow, and carpare seldom seen. There was a time when yellow were thought almost indispensable to Duckwings, but now they have nearly disappeared. Of course every bird in the pen must have the same shade, but if that were accomplished we should look only to the more important points of the birds.

BREEDING PHEASANTS (*Pheasant*).—We know no other. Lengthy treatises on these subjects are made up of non-essentials. Young hen Pheasants lay the earliest eggs. Two-year-old birds lay the largest number. The old hens require to be put to young cocks, and they will then go on well for years. It is well, however, and nothing is easier in a well-managed preserve, to turn out the hens after they have bred the second time, and put others in their places. The number of pens you have for adult birds must depend on the number of birds you wish to keep up. Your old birds are now, of course, out of the laying pen, and in the winter pen. Let those that have already bred two seasons grow their wings and fly away. Replace them with young birds from which you have bred this year for the first time, and in the pen they vacate put this year's points. By doing this you will always have a succession of two-year birds, and at no extra expense. These young hens that are to lay next season, and afterwards be your two-year-olds, should have their wings cut now, and be penned. A Pheasant that has had its liberty, although tame-bred, never, if caught again, becomes a tame bird to be depended upon for breeding in pens.

GAME CHICKENS—DUBBING (*Pile*).—It is very rare to find chickens that are deserted by the hen at a mouth do any good; but they should never be allowed to perch, as the breast bone must thereby become crooked. There is no cure for it, and it is a disqualification everywhere. Chickens that are deserted by their mother, should for some weeks be allowed to roost in their rip. They huddle together, and keep themselves warm, and it is better for them, while their bones are forming; whereas if they perch while they have cartilage instead of bone, their legs cannot support them, and their breasts rest on the perch. The bone is soft, and takes the impress of it. They may be dubbed at six or seven months old, but care must be taken not to perform the operation while feathers are forming. They are then in cockers' parlance in "bloody stub," and cannot bear the operation. Scissors used by grooms in clipping horses are good for dubbing. They are curved. The gills are taken off close, and the deaf-ears. The cuts are black the next day, and they soon clearise. The birds suffer so little, that if all that is removed be chopped up, they will eat it directly. It takes two persons to perform the operation properly.

FATTENING DUCES (*J. H.*).—With Ducks as with human beings, exercise is not favourable to fattening. Shut them in a small pigstye if you have one; if not, in some place of the same character. Feed them on oats, bran, and oatmeal, put in a shallow vessel—say from 1½ to 2 inches deep, add a little gravel, and cover the whole with water.

COLOUR OF THE EYES OF ARCHANGEL PIGEONS (*S. Smith*).—We never impugn the judgment of judges, for their decision is, as to any certain show, a final decision. However, we think that orange eyes suit best with the plumage of the Archangel, and prefer them decidedly to pearl colour.

RABBITS—LOP-EARED, SPANISH, ANDALUSIAN, AND PATAGONIAN (*Inquirer*).—The Lop-eared Rabbit is the variety, the point of which is length of ears, and the longer the better. A specimen with ears 23 inches long is good. The colour is of no importance if rightly distributed over the body. The Andalusian is a native of Spain, of large size, weighing from 12 to 18 lbs., colour grey, hair glossy and smooth. The ears are generally long and dangling, as if inclined to be half lop, at least, longer than in all the other varieties, Lop-ears excepted. This is at times also designated the Ram Rabbit. The Patagonian is another large variety more frequently found in France, and the sort seeming to be the

greatest favourite here is of a light yellow, or almost cream shade, so called; weight about from 12 to 15 lbs. Ears shorter and more erect than those of the Andalusian. The last two varieties are scarce, but they are valuable for the table.

CANARY (*Bird Fancier*).—Write to W. A. Blakston, Esq., 22, Norfolk Street, Sunderland.

GOLDFISH (*H. L.*).—Mr. G. H. King, 190, Great Portland Street, London.

OATS GROUND, &c. (*Inquirer*).—Crushed oats are oats crushed between two fluted rollers. Ground oats are the whole grain, including the husk, ground to a coarse flour, and oatmeal is the kernel of the grain only, ground to a coarse or a finer meal.

CANVAS HIVE COVER (*M. J. P.*).—We are unable to say where this can be obtained.

MOUSE AND BEETLE TRAPS (*Perplexed*).—For information respecting the prices of the inventions to which you refer apply at 10, Essex Street, Strand, London.

COVENT GARDEN MARKET.—AUGUST 24.

Our chief demand is now among the rougher descriptions of goods which are supplied in very large quantities, and, consequently, the sale must be forced at a low price to dispose of it. Continental supplies are also heavy, notwithstanding the interruption caused by the war. Potatoes are good and a fair steady trade is doing.

From observations taken near London during the last forty-three years, the average day temperature of the week is 70.8°, and its night temperature 47.3°. The greatest heat was 91°, on the 7th, 1868; and the lowest cold 25°, on the 7th, 1856. The greatest fall of rain was 1.50 inch.

THE GENUS SAMBUCUS, OR ELDER.

EVERYONE is acquainted with the common Elder, Elder berry, or Boortree. Although a native of this country, it is but little valued, but some cultivate it in gardens or shrubberies for ornament, as well for its flowers and berries. The former yield by distillation Elder-flower water, and from the berries Elder wine is made. The flowers are white and yellow, in very large heads, and agreeably fragrant; and they are succeeded by purple or black berries in autumn. The foliage is little different from that of the Ash, but wanting its light shining green, otherwise the tree might be taken for a low-growing bold-foliaged Ash. It grows anywhere. From old associations, or some such cause, it is allowed a place near almost every homestead, particularly those with any pretension to age, but it is seldom planted, or if so only to a very limited extent.

To the gardener, however, the Elder, though common, is one of the most valuable of trees; I regret its valuable properties are not more appreciated. In the first place, it acts as a preventive and destroyer of insects. If a quantity of the leaves be put into as much water as will cover them, and boiled until it becomes quite black, the liquor, after having been strained and cooled, may be applied through a fine-rosed watering pot to trees or bushes infested with caterpillars. Poured over the nests of ants it will drive them away; and the fresh leaves put in the runs of moles will soon cause them to disappear. The Elder is also valuable on account of its succeeding where few other trees will grow. In the smoky atmosphere of towns it thrives admirably; it succeeds as well in a confined as in an open space; and near the sea, in places where there are no trees, it attains in a short time a degree of vigour which is quite surprising.

In towns and near the sea, great difficulty is experienced in getting anything to grow to afford shelter for more tender subjects. I was much struck with the screens of Elder which I recently saw near Sunderland. The points most exposed were sheltered by hedges or screens of Elder, and it was remarkable what growths they had made, and what a fine shelter they formed to the plants they enclosed. Rough-looking though these hedges were, yet where the growth of more trim hedge plants is very slow, and in many cases impracticable without some protection, the value of the Elder is considerable; for, besides growing better than anything else, it effects in two or three years all we look for from a hedge. Some fine screens 5 and 6 feet high had been formed in three years from the cuttings. The cuttings are put in after the leaves fall in autumn, the ripened wood of one or more years' growth being cut into lengths of about a foot, and inserted to within an inch or two of the top, the uppermost joint only being left above ground. From 9 inches to a foot is the distance they are put in at, and all the attention they require is to be kept clear of weeds. If watered a few times in summer with sewage, the growth the first year is wonder-

ful. In fact, three years only are required for a screen of Elder 6 feet high and as much through, where the Thorn and Privet in that time can hardly make headway, and do not grow more inches than the Elder does feet.

Useful as the Elder is in smoky town gardens and positions near the sea, it is as useful in shrubberies in more favourable situations, being one of the few low trees or shrubs that succeed under the shade and drip of large trees, so that it ought to be in every pleasure ground. There are varieties of it which cannot fail to please, and which are deserving of more extended cultivation. The most beautiful variety is, I think, the cut or Parsley-leaved Elder (*Sambucus nigra laciniata*), the foliage being finely divided, and the plant not so strong as the common Elder. It has a very elegant appearance: it is also of very free growth. There is a sub-variety of this with yellow-striped leaves, which is far more ornamental than many vaunted novelties. It is, however, more tender than the preceding, and does not do well in exposed positions. The white-variegated form of the species (*S. nigra foliis-argenteis*) is a good distinct variegated shrub, not so vigorous as the parent, nor so capable of enduring exposure, and the same remarks apply to the yellow-variegated kind, which, though very ornamental, has the disadvantage of not succeeding in cold situations, though the Elders thrive in all but very bleak positions.

Ornamental as all the preceding are by their foliage, flowers, and fruit, none of them can compare with the red-berried Elder, which I think is *Sambucus racemosa*, though I am not sure of the proper name of this species, but it is one of the finest of all flowering deciduous shrubs. In May it is one sheet of white, every shoot bearing large heads of bloom, at a distance not unlike those of the Snow-ball (*Viburnum Opulus*), but which, if more closely examined, are found to be of a greenish yellow, and they continue long in beauty. The flowers, however, constitute but a small part of the plant's attractions, for the berries are of the finest coral red, rendering the plant so conspicuous at a distance as to be quite a feature. So bright are the berries in colour that those of the Mountain Ash are dull beside them. The berries are produced in clusters or heads, like the flowers, and are of the brightest red or scarlet of any berry I know. Their full colour is attained about the middle of July, but at the beginning of August they are highly ornamental, and they continue so until late in the year. In the beauty of its berries it eclipses every shrub that I know, and here it is growing in a variety of positions—beside the rich purple of the Berberis, both sheltered and exposed, and under the shade of large Sycamore trees—in all of which it shows advantageously. To see it in perfection it should be grown in a mass in an open situation, but protected from northerly and easterly winds; but even where exposed to these winds it maintains its ground, where Cupressus Lawsoniana, Portugal Laurels, and Rhododendrons are severely injured, and it survives under trees where the Yew, the common Laurel, and the Portugal Laurel have failed.

In appearance it much resembles the common Elder, but is more shrubby and compact. In smoky towns and

near the sea it is quite at home, and must prove invaluable in such localities. There is a variety with white and another with purple berries. I believe it is a native of several parts of the south of Europe. Those who do not already possess it should next autumn add a mass of it to their shrubberies. It is not particular in regard to soil and situation, and is easy of propagation by cuttings of the ripe shoots and by seeds.

—G. ABBEY.

POT VINES.

THE economical value of pot Vines has often been called in question; indeed, I have often heard people say, "Grapes produced on pot Vines are never worth eating." It is quite true they are often very inferior, nor is it surprising that such should be the case. Badly grown and badly ripened canes are often fruited in pots; and frequently where no fault can be found with the Vines they are expected to bear far too many bunches, and are not half fed nor attended to during their growth.

Gardening must generally be considered a luxury except in the case of the commonest vegetables. Supposing the problem to solve be how to get Grapes when they are worth, say, from 7s. to 10s. a-pound in the market, I think it is a great question whether this cannot be done more cheaply by growing pot Vines than by forcing permanent ones; besides which, nothing is more beautiful than a pot Vine loaded with well-ripened fruit.

Having seen at Chatsworth last spring the best house of pot Vines I ever saw grown, I asked Mr. Speed to tell me how they had been managed. They were standing on a shelf covered with white spar, such as is brought out of the Derbyshire lead mines, consequently not a root had grown out of the pots. Every eye had been allowed to break and produce a shoot, and each shoot had made six leaves before being stopped. From the time leaves were produced, till the fruit began to colour, the Vines had never had water without guano in it, the plan being to give very weak doses constantly in place of stronger ones at longer intervals. A quantity of Peruvian guano broken small and passed through a fine sieve stood in a large pot, and the foreman put as much as his closed hand grasped into a large watering-pan each time he filled it. I have never weighed this quantity, but it must be a small amount to the gallon.

One thing struck me—that was the very careful way the watering was performed. The man had in his left hand a small wooden hammer with which each pot was struck, and if the sound produced did not indicate a want of water the plant was passed by. During the hot weather the pots were examined twice a-day, so that no plant could suffer from want of water, or receive it before it was required.

I should think the Vines carried on an average 8 lbs. of Grapes, and yet many of them had only four bunches, and none more than five, and they were as well coloured as one would wish to see. As the Vines were trained to meet in the centre of a narrow double-roofed house, and the leaves of the Vines just met all the way up, the whole roof was covered by foliage, and the crop looked a very heavy one. It was one of the prettiest sights I ever saw. Where less skill and attention can be bestowed on pot Vines, it is a question if they had not better be placed on a rich bed of soil and be allowed to root through; but as I never before saw so good a lot of pot Vines as these were, I thought some of your readers might like to know how they were cultivated.—J. R. PEARSON, *Chilwell*.

A FEW SUPERIOR BEDDING PLANTS.

I HAVE read with interest what your correspondent, Mr. Peach, and others have lately written in the Journal on bedding plants, especially Geraniums, and I have a wish to recommend to your readers two which are by far the best that I have ever tried or seen—namely, *Vesuvius* and *Glorious*, raised and sent out by the Messrs. Smith, of Dulwich.

I have tried all the most highly commended varieties sent out during the last twelve years, and these two are the most effective bedders that have ever come under my notice. Taking into consideration habit and wonderful productiveness of bloom, in combination with substance of petal as points of merit, they have no equals that I know of. For distant effect, *Vesuvius* in particular, from its lively shade of scarlet, is most valuable. Contrary to the habit of most Geraniums, the more they grow the more productive are they of their fine trusses of bloom, borne on stiff stalks. When forced in moist stoves in winter their blooming powers are most conspicuous, as they

throw up a truss from nearly every leaf. *Glow*, raised by the same firm, is also a good bedder, but compared to the two referred to only second-rate.

Imperial Blue Ageratum sent out this year I regard as one of the finest bedding plants introduced for many years. There are four beds of it here, and they are a perfect sheet of beautiful lavender, while its habit is all that can be wished. In the distance it is much more effective than *Viola cornuta* or *Lobelia speciosa*, while its habit is preferable to either of these. *Tropaeolum Cooperi* for a sheet of orange scarlet, and its adaptation for scroff work, has no equal that I know. Golden Feather *Pyrethrum*, so severely condemned by some, surpasses any of the golden-leaved Geraniums. If raised from seed it seldom blooms much the first year. It requires, like most bedding plants, liberal culture.—D. THOMSON, *Drumlairig*.

A TRIAL OF PEAS.

I ENCLOSE a statement of the results of a trial of Peas, mostly well-known sorts, thinking it may be interesting and useful to some of your readers to know how they have behaved in such a season as the past on a heavy soil in the cool moist valley of the Lea. The first two sorts were sown on the 11th of March, the remainder on the 23rd of March. They were hoed frequently, but never watered.

Sutton's Ringleader.—Sown March 11th; fit for use June 10th. Height, 2½ feet.

Sangster's No. 1.—Sown March 11th; fit for use June 12th. Height, 2½ feet. Pods rather larger than *Sutton's Ringleader*.

Mutton in Paro.—Sown March 23rd; fit for use June 16th. Height, 1 foot. Pods large and well filled.

Nutting's No. 1. Whisked Marrow.—Sown March 23rd; fit for use June 16th. Height, 15 inches.

Advancer (McLean's).—Sown March 23rd; fit for use June 23rd. Height, 2 feet. Long, well-filled pods, and good cropper.

Champion of England.—Sown March 23rd; fit for use June 25th. Height, 4½ feet. Heavy cropper; pods of good length and well filled.

Hundredfold.—Sown March 23rd; fit for use June 25th. Height, 4½ feet. Heavy cropper; pods large and well filled; hard, and of indifferent flavour.

McLean's Wonderful.—Sown March 23rd; fit for use June 25th. Height, 3 feet. Good cropper; pods of good length, but not well filled.

McLean's Dwarf Prolific.—Sown March 23rd; fit for use June 27th. Height, 3½ feet. Good cropper; pods of good length, but not quite full.

Cullingford's Champion.—Sown March 23rd; fit for use June 27th. Height, 4½ feet. Fair cropper, bearing most towards the top; pods of medium length, four or five peas in each.

Laxton's Supreme.—Sown March 23rd; fit for use June 27th. Height, 4 feet. Medium cropper; pods large, but not well filled.

Princess Royal.—Sown March 23rd; fit for use June 27th. Height, 3 feet. Heavy cropper; pods large and well filled.

Yorkshire Hero.—Sown March 23rd; fit for use June 28th. Height, 2½ feet. Fair cropper; pods of medium length, four or five peas in each.

Ne Plus Ultra.—Sown March 23rd; fit for use June 30th. Height, 5½ feet. Pods large and well filled, good cropper.

McLean's Premier.—Sown March 23rd; fit for use June 30th. Height, 3 feet. Pods of good length and well filled; a good cropper; fine flavour.

Veitch's Perfection.—Sown March 23rd; fit for use July 2nd. Height, 3 feet. Heavy cropper; pods of good length, and very well filled.

The Prince.—Sown March 23rd; fit for use July 3rd. Height, 3 feet. Good cropper; pods medium length, five or six peas in each.

British Queen.—Sown March 23rd; fit for use July 4th. Height, 6 feet. Good cropper; pods large and well filled.—WILLIAM PAUL, *Paul's Nurseries, Waltham Cross, N.*

LE BOTT'S HAND DRILL.—Among the helps to gardens which the ingenuity of inventors has placed within our reach, a good place must be given to the hand drill, which has been already highly recommended, but of which I had no experience until this season. One knows the sort of haphazard way in which seeds are too often sown, patches of plants coming up in one place, while there is a blank in another. Sometimes we see seed sown through a quill placed in the cork of a bottle containing the seed, but this is a poor way of endeavouring to counter-

act the evil. Now nothing can be more effective and handy than Mr. Le Butt's hand drill. The seed is sown evenly, and by the use of the brass collar the drill can be adjusted to any description of seed. I have found it very useful, and can recommend it to any who like efficiency and neatness in their gardens.—D., Deal.

GERANIUMS GROWN IN RUTLAND DURING 1870.

I HAVE tried many varieties, but find none better than the following:—

For Bedding.—Stella and Cybister, both do well here, especially the latter; Trentham Scarlet; Christine, rather too seedy this dry summer; Sutton's Scarlet Perfection, the very best scarlet bedder I have ever grown, being dwarf, compact and a free bloomer, with well-shaped flowers; Indian Yellow; Orange Nosegay; Monsieur Martin; Captain Daley; Admiration; Dr. Hogg, good, but goes to seed rather too much; Mr. Eyles; Hon. Gathorne Hardy, the best Nosegay Geranium I have grown; and International.

Double Geraniums.—Gloire de Nancy, Madame Rose Charmeux, Madame Lemoine, and Marie Lemoine, are all good bedders.

For Pot Culture or Vases.—Donald Beaton, Lord Derby, Chieftain, Commander-in-Chief, Marie Van Houtte, Clipper, Mrs. William Paul, and Monsieur Conner.—E. C., Oakham.

STRAWBERRIES WORTHY AND UNWORTHY OF CULTIVATION.

In the retained list of kinds (page 121) I notice the following:—Oscar, Myatt's Eliza, Goliath, Duc de Malakoff, Comte de Paris, and Ajax, all most uncertain croppers in this northern locality. I have tried each of them, but have long since discarded them. On the other hand, in the rejected list I notice Comte de Zans, Cornucopia, Excellente, Lecocq Pine, and Wonderful—kinds that I have grown for years, and I cannot recall an instance in which they have failed to give satisfaction to the grower.

Again, in the list of retained kinds, those stated to possess especial merit are marked with an asterisk. I notice a variety apparently considered unworthy of that distinction, which I think the best Strawberry I ever saw—namely, W. J. Nicholson. I saw a very fine plantation of this variety at Eglescliffe on the 11th of July, the quantity and size of the fruit being something wonderful for the season, and I was assured it was the first to ripen in any quantity there, having completely beaten kinds like Sir J. Paxton. Its habit is good, with nice bright green foliage; the fruit, sometimes wedge-shaped but generally conical, is very bright in colour, with rich, juicy, melting white flesh—in fact, I think this the best of any of the large-fruited varieties possessed of fine flavour that I ever saw, and those who have it not would do well to procure it at once.

I have seen another fine seedling, raised by M. Gloede, called James Veitch, which must, I think, prove an acquisition, though I have not tasted it. The fruit, however, is very large, and the plant appears to be a capital cropper.

The following are a few of the kinds I have noticed as generally doing well wherever I have seen them grown in the north—viz., Lucas, Cockscomb, Wonderful, Cornucopia (capital for preserving), La Constante, Comte de Zans, Ascot Pine Apple, W. J. Nicholson, Dr. Hogg, Mr. Radcliffe, President, and Sir J. Paxton.—J. W., *Middlesbrough-on-Tees*.

DIFFERENCES ABOUT ROSES.

MADAMEISSELLE MARIE RABY having been before the public since 1865, and universally acknowledged by all Rose-growers to be good, has at last been admitted by Mr. Radcliffe among the good Roses, as having been fully proved by him. I suppose in about two years' time we shall be told by the same authority that we may safely grow Madame la Baronne de Rothschild or La France. Some persons may prefer to try if even a scribbler's opinion be sound rather than wait for a fiat issued from Okeford Fitzpaine.—AN AMATEUR.

Cabbage plants three times in the season—say the first week in May, the first week in June, and the first week in July. The moth which lays the eggs will not light on the plants on account of the smell of the root, and the root is a good manure.—A CONSTANT READER.

THE ROYAL HORTICULTURAL SOCIETY. PROPOSED VISIT TO NOTTINGHAM.

THE Council of the Royal Horticultural Society having determined upon each year holding a summer exhibition in some important town in Great Britain, a meeting was held August 25th in the Mayor's parlour, at the Exchange, to take into consideration the desirability of forwarding an invitation from Nottingham for their first exhibition in 1871 to be held in that town. Lord Belper presided, and there were also present the Mayor, Mr. H. Sherbrooke, Mr. E. J. Lowe, Mr. J. L. Thackeray, Mr. J. H. Lee, Mr. R. Birkin, Mr. J. Barber, Mr. Ald. Herbert, the Rev. J. M. Valpy, Messrs. Chapman, Cann, the Rev. Samuel Reynolds Hole, Messrs. Armitage, Johnson (Town Clerk), Tarbotton, Starey, Ayres, Speed, of Chatsworth; Anderson, of Newstead; Pearson, of Chilwell; Cooling, of Derby; Caparn, of Newark; Gibbons, of Bramcote; Spencer, of Beeston; Edwards, of Nuttall; Fratingham, of Beeston; Cookson, of Carrington; Johnson, of Colwick; Read, of Pleasley Vale, &c. The following gentlemen, not being able to attend, sent their approval of the project:—Mr. Ingram, of Belvoir Castle; Mr. Lamb, of Colston Bassett; Mr. Tillery, of Welbeck; Mr. Henderson, of Thoresby; Mr. Miller, of Worksop Manor; Mr. Barton, of Oxtou; Mr. Cruikshank, of Kingston; Mr. Merryweather, of Southwell, and others. In opening the meeting,

His Lordship observed that no doubt those present were aware of the object which had brought them together. The Royal Horticultural Society had held its meetings in the country, but always at the same place and at the same time as the Royal Agricultural Society. He understood that now, however, they were of opinion that it would be more advantageous to hold a separate meeting, and some gentlemen believed that if there was an application from Nottingham it might be held there. The meeting was called for the purpose of considering the desirability of sending an invitation, and as Mr. Lowe would be prepared to state all particulars, he should at once call upon him to do so. (Hear, hear.)

Mr. Lowe remarked that he had received a number of letters from different persons who were unfortunately absent from the meeting, amongst others from Earl Manvers, who was at the Isle of Wight, but who would have been glad to have attended and given his cordial support. Sir Henry Bromley had also written, but as his train did not arrive until ten minutes to twelve o'clock they could not expect him there at eleven o'clock. Sir Henry expressed himself very anxious that they should get the Society to hold its meeting at Nottingham; and added that he should like to see an artisans' prize cup worth ten guineas, towards which object he should wish to give five guineas himself. (Hear, hear.) He had had letters also from the Mayor of Newark and others, but he would not detain the meeting by reading them. As Lord Belper had said, the Royal Horticultural Society had for the last four years gone into the provinces once a year with the Agricultural Society, but it had now increased so much in importance that it felt that it ought no longer to play second fiddle to any other society. It had therefore determined upon holding a show by itself in some town not then frequented by the Royal Agricultural Society. Hearing of this he spoke to some of the members of the Council, and asked if Nottingham sent a proper invitation whether there would be any chance of success in obtaining the first independent meeting of the Royal Horticultural Society there. To that question he received a very favourable reply, and he believed that, though there were other towns in the field, they stood a better chance than any other. (Hear, hear.) He next wrote to the Secretary of the Horticultural Society to inquire the conditions on which they would come, and received this reply:—"I am favoured with your letter of the 4th inst., and, in reply, beg to inform you that the sum required as a guarantee fund is £700 when the Royal Horticultural Society is visiting the provinces, and the following will give you an idea of the amounts collected for special prizes in the towns visited by the Society—viz., at Bury St. Edmunds we offered £423 1s., they collected £238 6s. 6d.; at Leicester we offered £478 10s. 6d., they collected £362; at Manchester, we offered £497 16s. 6d., they collected £394 9s.; at Oxford we offered £510 6s., they collected £251 0s. 6d." From this it appeared that the prize

AVOIDING CABBAGE CATERPILLARS.—A correspondent lately asked how to keep caterpillars from Cabbages. I have found it a good plan to sow a little dry root between the rows of

list of the Society had gradually risen from £400 to £500, whilst the local subscription list had been from £250 to £390. With regard to the local list, he thought the sum was so small, that when spread over so large an area there could be no difficulty in getting it; and with respect to the £700 required as a guarantee fund, when they considered the importance of the exhibition, and the fact that it was kept open for four days, they would see that there was little, if any, of that money really needed. He believed none was required at Manchester, and he did not know what would be required at Oxford this year. Such a show as the Royal Horticultural Society's now was Nottingham had not yet witnessed. Two years ago the Society held a meeting with the Agricultural Society at Leicester, but that was at a time when plants were out of their glory. When the Society came forth into the provinces when plants were just in perfection, he was not exaggerating if he said that the show would be one which if once seen would never be forgotten. He was a strong advocate for Nottingham to receive the Horticultural Society, for he thought it would be a great honour for them to get the first independent meeting of the Society held here. He hoped they should succeed in doing so. (Applause).

Mr. Thackeray moved "that the present meeting considers it desirable to invite the Royal Horticultural Society to hold their great provincial flower show in Nottingham in 1871, and that the Lord-Lieutenant, as chairman, be requested to communicate this wish to the President of that Society." He considered that it would be a great honour if they could get the Society to hold its meeting there. He had no doubt as to its financial success, and should have no objection to becoming one of the guarantors, so confident did he feel on the subject. There were few towns where the artisan class were greater cultivators of flowers than in Nottingham, and it would be a means of great instruction, as well as a treat, to them to inspect the show of such a Society. As regarded the site, he thought the best place would be the Arboretum; and he did not see any difficulty in setting it apart for such an occasion. (Hear, hear.)

Mr. Lee seconded the resolution, and said he sincerely trusted that the application to the Society might be successful.—The motion was carried unanimously.

Mr. Barber said he supported the movement which had been started. Like all other movements, however, it required the sinews of war. As Mr. Lowe had explained, the amount of subscription required was not very large, and he thought there would be no difficulty in getting the necessary fund. Besides the subscription, a guarantee fund of £700 was required to be raised, and should any portion be needed, those gentlemen who guaranteed the money would be called on *pro rata*, according to the amount of their guarantee. In some cases no portion of the money was required, as for instance, at Manchester. He begged to move "That a guarantee and local subscription list be at once commenced, as an evidence that Nottingham is prepared to give the Royal Horticultural Society a proper reception." (Hear, hear.)

Mr. Starey seconded the motion, and remarked that the show would be a means of pleasure to a great many in the neighbourhood who were fond of horticultural pursuits. The amount required was very little when spread over the town and county, and if they all did a little towards it, there would not be the slightest difficulty in obtaining it. For his own part, he could only say that he should be very pleased to assist. (Hear, hear.)

The motion was carried *nem. dis.*

Mr. Leivers proposed that a committee be formed, consisting of the Mayor, chairman; Mr. J. Smith Wright, treasurer; and Mr. Lowe, secretary, together with Mr. Sherbrooke, Mr. Milward, Mr. Edge, Mr. Seely, M.P., Mr. Smith, M.P., Mr. Akroyd, Mr. Newton, Rev. S. R. Hole, Dr. Robertson, Sir H. Bromley, Messrs. Windley, Birkin, jun., Forman, Farmer, Shilton, Knight, Day, Gadd, Ingram, Speed, Cruickshank, Pearson, Evans, Henderson, Tillery, and Lamb, with power to add to their number; also that the Mayors of Derby, Leicester, Grantham, Retford, and Newark be invited to form district committees, to co-operate with that at Nottingham.

Mr. Goodall seconded the motion, and it was carried.

The assemblage, presided over by the Lord-Lieutenant (Lord Belper) was a most respectable one, representing all classes, and with a large sprinkling of the practical gardening element. Nothing could have been more unanimous than the tone of the meeting. Every person seemed willing and anxious to do all that he could, and the offers of material support were such as to leave nothing to be desired. One special feature may be noted, and that was, Sir Henry Bromley, who was unable to

get to the meeting in proper time, suggested that a ten-guinea cup should be given to artisans for Roses, to which he offered to subscribe five guineas. This is a very good beginning, and in the right direction, and though it was not announced at the meeting, we have reason to know that, should the exhibition be held here, Lord Belper has promised twenty guineas towards the special prizes. We therefore think it is only necessary for us to make a united effort, and success is certain to crown it. Other towns, York, Manchester, and Leeds, are competing against us; but there is no doubt the Council will recollect that these towns for years past have had their large flower shows, while in this locality a really first-class show would be an entire novelty, and hence we assert the chances of complete success are greater here than they can be in any place where large flower shows are common. Then, as a gardening centre, there is no town in England that can compare with our own. Every second man you meet, whether dressed in fustian or fine linen, is a gardener, and many of them cultivators of superior skill. Where great flower shows are common, success cannot be so certain as where there is novelty added to the attraction; and here, anything really great, such as the Royal Horticultural Society could place before the visitors, would be something that must command success.—(Nottinghamshire Guardian.)

BLOOMING GLOXINIA SEEDLINGS.

LET me add, as a corollary to Mr. Luckhurst's article on Gloxinias, that where there is a stove, or even, I should imagine, any kind of forcing pit, there is not the slightest occasion to keep Gloxinia seedlings for twelve months before blooming them. On the 28th March last I sowed a pan of Gloxinia seed, which produced many hundreds of seedlings. At our flower show on July 10th I had two of these in bloom, and since then I have had scores in fine bloom and in endless variety. All that was done was to give them one or two shifts and bring them on in the Cucumber house. I came to the conclusion that the Gloxinia was the most satisfactory florists' flower to raise from seed that I had ever sown.—ALFRED O. WALKER.

PICKING AND MARKETING FRUIT.

NOTHING adds so much to the profits of fruit culture as a good system of picking and marketing. Often a single shipment of Strawberries will vary from 40 to 100 dols. in price, according to the neatness of the appearance of the fruit, its quality, and its condition.

Josiah Hoopes, in the *Delaware Republican*, in a series of articles on fruit culture, gives many judicious hints on this important subject. In regard to the gathering of ripe fruits of different kinds, he says that no fruit should be taken from the tree or plant during a damp time, and especially when the dew is plentiful in early morning. Each specimen should be taken from the tree one by one, handled as if they had been so many eggs. The slightest bruise or even abrasion of the skin is the sure forerunner of a dark spot, which will eventually change into some form of rot. The spores or seed of fungi are always ready to assist in the work of dissolution, and the slightest scratch gives them a foothold for their destructive work. Scarcely any varieties of the largest fruits colour and ripen so well if left to perfect themselves on the tree, and especially is this true in respect to Pears. Summer varieties, as they approach maturity, loosen their hold somewhat on the limb, and by gently raising the fruit they will easily detach themselves at the proper period. This is an excellent test, and may always be relied on. To colour up fruit nicely, all that is necessary will be to spread a blanket on the floor of a cool room, and then thinly and evenly place the fruit on the floor. A second blanket must be spread over them, and in a short time the effect of this treatment will be apparent. Pears perfected in this manner rarely have the meanness of their naturally-ripened companions; nor do they prematurely decay at the core as when left on the tree. Peaches are too frequently gathered before attaining full size, and when this is the case we need not expect good flavour. They must obtain this requisite before gathering; although it is not necessary to delay picking until very mellow. As a general rule, all small fruits are gathered too early; and, as high colour is not a sign of maturity, many experienced fruit growers are frequently misled. Never pick Strawberries because they are red, nor Blackberries solely on account of their dark appearance. Each should remain on the plant for some time thereafter. Straw-

berries picked with the calyx adhering will always carry better and be less liable to decay than if carelessly pulled off without this appendage. And so with Cherries also, as the cavities made by parting with their stalks are liable to engender speedy decay. Neither do they present so fine an appearance on the table, or in the fruit baskets of our market gardeners as when temptingly displayed, each with its stalk attached. The foregoing remarks in relation to the proper time for gathering fruits are equally applicable to Grapes. These generally colour long before they are mature; and thus many a novice in fruit culture frequently forms an unjust opinion of his varieties simply from testing unripened specimens. Grapes should always be severed from the Vine with strong scissors or trimming-shears, and never twisted or broken off.—(*Horticulturist*)

MELONS IN A GROUND VINERY.

AFTER raising some plants in a warm orchard house, I placed them under a ground vinery, without any bottom heat. There were three sorts, all sown on the same day—Windsor Prize, Beechwood (for which I have to thank you), and Achopnesor-rischer. Windsor ripened on the 6th of August, and Beechwood on the 13th. Both sorts are now finished. The third sort, which is said to grow out of doors on a ridge, has not yet ripened; so under glass it seems to have no advantage over sorts which are reputed more tender. In former years I have ripened it in warmth, and found it of good flavour, though coarse in appearance.

An American correspondent of yours once stated that no soil succeeded so well as virgin forest mould. This, I presume, means leaf mould and sand. Now, in England we prefer stiffer soil: so, to decide the question, I filled a Sea-kale pot with an imitation of forest mould mixed with pieces of broken brick, as better than stones, while a similar pot was filled with a mixture of the same soil with loam. Into each pot was put a plant of Windsor Prize. The plant in light soil was always thirsty, and produced but one fruit weighing 2 lbs. 2 ozs. The heaviest fruit on the other weighed 4 lbs. 11 ozs.

In cutting open a Beechwood to-day, and very excellent it was, I could not help contemplating the enormous number of its seeds, yet most of these seeds were probably fertilised, and only by a touch of a male flower to the stigma. What, then, must not be the minuteness of each grain of pollen, and how marvellous its active power!—G. S.

P.S.—Though the ground-vinery system succeeds perfectly in fine summers like 1868 and 1870, it did not succeed in 1869.

MY GARDEN PLUM ORCHARD.

So many of my friends who have seen my little Plum trees in growth have written to know more about their different qualities, that I have thought it best to send a few notes to "our Journal," so that all may read, as it were, from one letter. At the same time I have thought it might interest others unknown to me, and who are about to plant. I consider my fruit trees in many cases as trees of ornament as well as utility, and therefore plant many of them among my shrubs, where they all thrive exceedingly well, and not only are beautiful in the spring when in bloom, but give a rich colouring effect in the autumn when in fruit. But there are some at least that I would not advise to be so planted, and they are all the Green Gage tribe, for the bullfinches will assuredly peck out all the bloom buds and spoil the trees. There are, however, many others, Plums as well as Pears, which do well; and at this time of the year, when flowers are scarce, my fruit trees are the chief attraction to my visitors. I do not pretend to go into the minutiae of every kind, but to give a general outline as to their qualities as grown here. Those wishing to know more I would advise to consult that very excellent work, Dr. Hogg's "Fruit Manual," a book which no pomologist ought to be without. As I attend to all my Plum trees entirely myself, I have the opportunity of judging pretty correctly as to their qualities as regards the summer-pruning system, brought into notice by Mr. Rivers, of Sawbridgeworth, and to whom amateur fruit-growers are indebted for much instruction, knowledge, and pleasure.

I give below a few notes of some of the sorts of Plums which have already ripened with me, and if thought worth while I will send more as others come to maturity, as I have many yet in full growth, some of which are especial favourites of almost every one, though grown under different circumstances than as out-door pyramids and bushes. I may here remark that, as a

rule, I find the Gage tribe less adapted for pyramids than bushes, as some are difficult to keep in form. Several of my trees did marvels this year. In the way of crop I have one little bush of the Mirabelle Plum, just 1 foot high, that has twenty-one Plums on it; I merely retained the quantity just to see how many it would carry.

Early Mirabelle.—This Plum was the first of my earliest to ripen. It is a small round fruit of a light greenish yellow, slightly tinted with red on the sunny side, and covered with a thin grey bloom; the flavour, if I may use the expression, is bright, sweet, and delicious. I gathered the first fruit on July 22nd. It is an excellent bearer, and makes a good pyramid or bush.

Early Rivers is a first-class variety as regards cropping. For the last two years the quantity has been wonderful. The fruit is of a deep purple, covered with a thick grey bloom. It is oval in form, and when suffered to hang long on the tree has a fine vinous flavour. It makes an excellent pyramid or bush; the fruit was ripe July 29th.

St. Etienne very much resembles the Early Mirabelle in form and colour, but is rather larger. It does not hang quite so well, nor is it of quite so good a flavour. It makes a good pyramid. The fruit was gathered on July 30th.

Early Orleans is a second-class Plum, an excellent bearer, but better adapted for a bush than a pyramid. The fruit is too well known to need description.

Devonshire's Superb is a fine, large, rich Plum, of a bright yellow colour, slightly tinted with purplish red, and spotted on the sunny side. It is vigorous in growth, but its branches are apt to die from no seeming cause. It makes a large pyramid, but is rather a shy bearer.

Red Morocco is a fine, large, culinary Plum of a deep bright red colour, almost purple; in form it is a long oval, and rather more narrow at one end. The flesh is firm, and it preserves well. It is best kept as a bush. It was gathered August 10th.

De Montfort is a very rich, sugary, delicious Plum, above the medium size, oval in shape, and of a deep purple, streaked with a lighter colour and brown. It is a very fair bearer, and is well worth growing either as a pyramid or bush. It was gathered August 15th. If allowed to hang until it shivers it makes a perfect sweetmeat.

Prince Englebert makes a noble pyramid, and, when the fruit on it is ripe, has a fine appearance, it being of deep purple colour, covered with a beautiful blue bloom. The fruit is large, long oval in form, and when quite ripe is delicious. It is strong in constitution, an excellent bearer, and is well worth cultivating. It was gathered August 18th.

The Orleans is a well-known Plum. It bears well and makes a good pyramid or bush. It was gathered August 26th.

Peach Plum.—This is large and delicious, of excellent quality; but with me it is a bad grower, dying-back continually, although a good bearer. I am afraid I must give it up for that reason.

Mirabelle is a small round Plum, of a deep bright yellow colour covered with dots. It is of good flavour, though rather mealy at times. It is an excellent bearer, makes a very compact and healthy pyramid, and might be grown as an ornamental tree if considered needful. With most it is a great favourite.

Of these I would select for pyramid growth, the Early Mirabelle, Early Rivers, De Montfort, Prince Englebert, Orleans, and Mirabelle.—HARRISON WELB, *Weirleigh, Kent*.

METROPOLITAN SOCIETY'S EXHIBITION AT THE CRYSTAL PALACE.

I AM glad to say, that notwithstanding the very unfavourable character of the season for florists' flowers, there is every probability of a good exhibition. The following gentlemen have kindly consented to act as Judges:—For Dahlias: Mr. Charles Turner, Slough; Mr. Richard Dean, Ealing; Mr. W. Holmes, Hackney. For Hollyhocks and Gladiolus: Mr. John Standish, Ascot; Mr. J. Fraser, Lea Bridge; Mr. Kinghorn, Richmond. For Asters, Verbenas, and Roses: The Rev. Cleaver Peach, Appleton-le-Street; Mr. Lidgard, Hammersmith; and Mr. Cutbush, Highgate. For baskets of cut flowers: W. Thomson, Esq., Penge.—D., *Deal*.

MESSRS. WEEKS & CO.'S PATENT DUPLEX BOILER.—We are informed that this is now in regular work at W. Leaf, Esq.'s, Park Hill, Streatham. If it fulfils all that is stated relative to

its advantages, it will be what Messrs. Weeks assert it is, "the best," but continued use can best decide that.

BRADFORD ANNUAL GOOSEBERRY SHOW.

This was held at the Junction Inn, Manningham, near Bradford Yorkshire, on August 29th.

Mr. John Emmott, Judge and Weigher.

The above were all grown in the immediate neighbourhood of one of the largest manufacturing towns in Yorkshire.

JUDGES DISQUALIFYING PELARGONIUMS.

WERE the Judges of a flower show right in disqualifying anyone for exhibiting the blooms of Le Grand, Stella, Lord Palmerston, and Cybister as single Zonals?—H. A., *Newick*.

[Much will depend on the wording of the schedule. All the varieties you name are Nosegays, and do not belong to the Zonal section. We should therefore say any judge would rightly disqualify in your case if the class was for Zonals only. Most schedules in the present day give distinct classes for Nosegays and Zonals.—W.]

CHARRING REFUSE.

To make room for Mushroom beds out of doors I had to get rid of a huge mass of woody rubbish, chiefly cuttings and prunings that were small, averaging from one-eighth to one-quarter-inch diameter, some being with and some without leaves. I could soon have burned the whole into a few barrowloads of ashes, but I did not wish to waste it so; and therefore I set apart a day, and had all charred in the simple mode recently described (vol. xviii., page 304). I have thus easily obtained from two to three cartloads of charred refuse; the half, or rather more perhaps, will be fine rough charcoal dust, so useful

for cuttings; and the other will be small hills of charred wood of the sizes above indicated, which we can again separate into different sizes by means of a sieve. Now the quantity is entirely owing to making heaps of the rubbish rather small, and pulling it out as soon as charred. Even the dampish litter placed on the top was well charred. In every department I shall find this most useful. Had I attempted to char this heap of rubbish in the usual way the great bulk, in spite of every care, would have gone to ashes, which would have been chiefly valuable for the alkalies they contained. Now the finest charred dust will be very useful for cuttings, seed-covering, &c., and the larger for potting and drainage, making many a compost sweet and porous that might have been the reverse.—R. FISH.

[Of the two or three cartloads Mr. Fish has just made he has sent us a sample, and though he tells us that there are larger pieces in the heap and more dust in others, we can clearly perceive how useful such small stuff is.—Eds.]

OUR SALAD HERBS.

THERE is perhaps no country in the world so rich as England in native materials for salad-making, and none in which ignorance and prejudice have more restricted their employment. At every season of the year the peasant may cull from the field and hedgerow wholesome herbs which would impart a pleasant variety to his monotonous meal, and save his store of Potatoes from premature exhaustion; and there can be no question that in hot seasons a judicious admixture of fresh green food is as salutary as it is agreeable. Much has been said lately about the advantage which the labouring man would derive from an accurate acquaintance with the various sorts of Fungus, and he has been gravely told that the *Fistulina hepatica* is an admirable substitute for beefsteak, and the *Agaricus gambosus* for the equally unknown veal cutlet. But deep-rooted suspicion is not easily eradicated, and there will always be a certain amount of hazard in dealing with a class of products in which the distinctions between noxious and innocuous are not very clearly marked. There is not this difficulty with regard to salad herbs, and we conceive that the diffusion of a little knowledge as to their properties and value would be an unmixed benefit to our rural population.

The first place must be assigned, on the score of antiquity, to the Sorrel plant (*Rumex acetosa*), which in some districts still preserves the name of "green sauce," assigned to it in early times when it formed almost the only dinner vegetable. Its acid is pleasant and wholesome, and more delicate in flavour than that of the Wood Sorrel (*Oxalis Acetosella*), which, however, is used for table purposes in France and Germany. Chervil (*Anthriscus Cerefolium*) is often found in a wild state, and is an admirable addition to the salad bowl; and it is unnecessary to enlarge upon the virtues of Celery (*Apium graveolens*) when improved by cultivation. John Ray, writing in 1663, says that "The Italians use several herbs for sallets which are not yet, or have not been used lately, but in England—viz., Selleri, which is nothing else but the Sweet Smallage; the young shoots whereof, with a little of the head of the root cut off, they eat raw with oil and pepper;" and to this we may add that the Alexander (*Smyrnum Olusatrum*) is no bad substitute for its better-known congener. The Dandelion, which in France is blanched for the purpose, affords that *amari aliquid* which the professed salad-maker finds in the leaves of the Endive, and the same essential ingredient may be supplied by the Avena (*Geum urbanum*), the Bladder Campion (*Silene inflata*), and the tender shoots of the wild Hop. Most people are familiar with the properties of the Water Cress (*Nasturtium officinale*), and the Garlic Hedge Mustard (*Erysimum Alliaria*); but it may not be generally known that the common Shepherd's Purse (*Capsella bursa-pastoris*) and Lady's Smock (*Cardamine pratensis*) are pleasant additions, whose merits have long been recognised by our foreign neighbours. In fact, there is scarcely a herb that grows which has not some culinary virtue in a French peasant's eyes. Out of the blanched shoots of the wild Chicory (*Chicorium Intybus*), he forms the well-known *barbe de Capucin*, and dignifies with the title of *salade de Charvine* our own neglected Corn Salad (*Pedia olitoria*). It would be very easy to extend the dimensions of our list of native salad herbs, for there are, perhaps, some palates to which the strong flavours of the Chive (*Allium Schoenoprasum*) and Stonecrop (*Sedum reflexum*) may commend themselves, but enough has been said to show that Nature has not dealt niggardly with us, and that only knowledge is needful to make

the riches she offers available. If the British peasant can be taught to discover hidden virtues in these plants with whose outward forms he has had a life-long familiarity, we do not despair of his acquiring the one secret of salad-making—viz., the judicious employment of oil so as to correct the acid juices of the plants and yet preserve their several flavours unimpaired.—C. J. ROBINSON.—(Nature)

GRAPES NOT COLOURING AND SHANKING.

I HAVE a span-roofed house with glass all round to about 3 feet from the floor, and with an inside border. The bottom is concreted and drained with pipes; on this is nearly a foot of broken bricks, &c., for drainage, and on the latter about 2 feet 9 inches of decayed turf, with layers of old wall plaster and mortar. In this material the roots are planted. The Vines are five years old; they were started this year in the middle of January, therefore the fruit is overripe. For the last two years the Grapes have not coloured well, and several of the bunches have some shanked berries upon them; I am satisfied with their size (between 2 lbs. and 3 lbs. per bunch), and the berries are fine. I am afraid there is some improper treatment on my part. From their starting the Vines have been constantly watered up to the first week in July, since which time they have not been watered, but they have since then thrown out fresh shoots, producing fresh bunches of Grapes. The foliage is large and healthy when I expected the sap to have been drying and the root action ceased. Did I use water too abundantly, and for too long a time? or is the bottom and material for the roots wrongly constructed? or has the soil become too dense from the watering and wants now renewing?—J. H.

[We think the chief faults have been overcropping and over-watering. The Vines seem to be in such a thriving fertile condition that we would not care to renew the soil, but it would be well to have a few trial holes, so as to know the state of the border generally before heavy waterings.—EDS.]

THE AMATEUR GARDENER.

(CHAPTERS NOT IN WALTON.)

No. 4.

HORTATOR.—Now then, my friends, permit me to present you to the queen of flowers, for this bright day of June is one of her majesty's most joyous levées.

CLERICUS.—Are there no kings or prince consorts to support the royal dignity?

SYLVIA.—Indeed there are many. For instance, surely this deep crimson Charles Lefebvre is a worthy consort to Coupe d'Hébe; especially, too, as the beauty of the latter does not extend much beyond midsummer, and so is a true type of the brief existence of feminine charms.

CVIS.—Had such a remark come from masculine lips I should have been tempted to question its soundness, for the calm gentle expression of feminine loveliness in old age has to me peculiar fascination.

CLERICUS.—These are indeed lovely Roses! They are, I perceive, principally dwarfs and pillars. But where are your standards?

HORTATOR.—Conspicuous by their absence! Probably you may greatly question my taste when I tell you that I have an invincible hatred of them.

SYLVIA.—Shared by myself, if Hortator would modify his strong expression by the substitution of objection for hatred, for I can't admit such a word in connection with Roses.

CVIS.—What may be the grounds of your strong dislike, Hortator?

HORTATOR.—Principally their ugliness—a very decided word this, notwithstanding Sylvia's reproof, for standard Roses always remind me of the beautiful princess's head upon the red republican's pike in the great French revolution.

SYLVIA.—Or a less frightful simile, and quite as appropriate, would be "long broomsicks with a flaunting head-dress."

CVIS.—You modified your objection by the word principally. What are the other objections?

HORTATOR.—Many, one of which is their short-livedness; a second, their throwing up shoots here, there, and everywhere, so that they require constant watching; a third, that they require peculiar soil to suit them; another, that they are often partially destroyed by frost, so that while one side of the head is strong and vigorous the other is weak and feeble, and in

severe frosts the head is frequently destroyed altogether, and then your Rose is gone; whereas, if the heads of Roses on their own roots be killed it is seldom that the roots themselves are, so that they push forth again in spring with little abated vigour.

CLERICUS.—But are there not dwarf Roses budded, or "worked," as I believe they are called, upon foreign stocks?

HORTATOR.—You mean upon the Manetti stock. Yes, and they are far less objectionable than the Briar, as, if properly planted, they throw up only a few shoots; but they are frequently difficult to distinguish from the true branch. The only possible defence I can imagine to be made for standard Roses is the ease with which they may be procured, accounted for readily by the rapidity with which they are budded and sent out for sale. Pillar Roses like this [pointing to a specimen of the Duchess of Sutherland] certainly take some time to raise to this height and state of perfection.

CVIS.—It is indeed magnificent! One mass of flower from the top to the very bottom. But surely there must be much art required to reach such perfection as this.

SYLVIA.—No art at all, simple judicious training and pruning, which observation of the habit and growth of the Rose will soon enable anyone who loves flowers to do for himself. I always think if Roses must be invested with royalty that I would have kings, queens, and princesses; all the dark ones should be kings—Charles Lefebvre, by-the-by, should be emperor—the reds and yellows queens, and the Tea-scented a family of princesses.

HORTATOR.—If Charles Lefebvre be an emperor, then surely Maréchal Niel, notwithstanding the masculine name, should be empress; never was there a greater misnomer than to give such a name to such a Rose.

CLERICUS.—What a lovely Rose is the Cloth of Gold. I know but little about Roses, but my eyes were almost dazzled by the sight of this in the garden of the old Bi-hop's palace at Wells. The gardener there told me that he had cut eight hundred blooms from that tree in one season! It covers a large space on the ruined stone wall of that venerable pile. He told me, too, what seemed to surprise him much, that he had in vain endeavoured to coax Maréchal Niel into bloom; indeed, that he had lost three plants in succession in the winter, but that he was now going to try it on its own roots.

HORTATOR.—And will, doubtless, succeed.

CVIS.—Pray tell me, Hortator, what gardens that are accessible are most worth seeing.

HORTATOR.—That is a wide question, but those that at once strike me are—Chatsworth (the Duke of Devonshire's, in Derbyshire); Treutham (the Duke of Sutherland's in Staffordshire); Enville (the Earl of Stamford's, in the same county); and Deepdene (Mrs. Hope's, near Dorking, in Surrey). The latter is unique in its way, which is attributable to nature rather than art, though art has greatly assisted in making it one of the most classical gardens in the kingdom.

CLERICUS.—It always seems to me a matter of regret that in such gardens, where the owners so kindly admit the public, some uniform plan of payment for the privilege is not adopted, instead of leaving it to individuals to fee the gardeners. Not knowing whether we have paid sufficient to satisfy them, or may be, that we have overpaid, thus inflicting an injustice upon other visitors, appears to me most objectionable.

HORTATOR.—True, indeed, and did I possess such gardens I should adopt a plan that I think all would be satisfied with, and which would be a great help to any neighbouring local charity. I would have printed tickets admitting a single person at 1s., and others at 2s. 6d. admitting a party of four, stating distinctly for what purpose the proceeds would be applied, and also that further fees were strictly prohibited. Certain days might be mentioned when the gardens would be accessible, and the expense of the man (he need not be a gardener, thus avoiding the inconvenience of the interruption of the work), might be deducted from the amount. Were this plan adopted at such a place as Enville, where visitors may frequently be counted by hundreds in a day, the help to any neighbouring hospital would be material.

CLERICUS.—An excellent idea. What would I give for such aid to my parochial institution.

CVIS.—But this is a digression from the great Rose question. Pray tell me the names of those you would recommend me to purchase, for I perceive, like the family human, though they resemble each other in general features, yet they differ materially on closer contact.

HORTATOR.—Well, I shall indeed be very glad to furnish

you with a list which I could recommend, but it would take me some little time to make the selection, which I will, therefore, defer until we have a longer time to discuss the subject as I suggested, and you will not want to send in your order before October at least.—HORTATOR.

BOXES FOR HOLDING USUAL MEASURES.

THE following table will be found valuable to many of our readers:—A box 24 inches by 16 inches square, and 28 inches deep, will contain a barrel. A box 26 inches by 15½ inches square, and 8 inches deep, will contain a bushel. A box 12 inches by 11½ inches square, and 9 inches deep, will contain half a bushel. A box 8 inches by 8 inches square, and 8 inches deep will contain a peck. A box 8 inches by 8 inches square, and 4½ inches deep, will contain one gallon. A box 7 inches by 8 inches square, and 4½ inches deep will contain half a gallon. A box 4 inches by 4 inches square, and 4½ inches deep, will contain a pint.—(*English Mechanic.*)

ABOUT THE LAND'S END.

“PENZANCE, eight or fifteen days for 24s.” “Yes, that will do.” Away, then, last Saturday morning at six o'clock in my good friend's trap to Paddington. London is scarcely up, inns and cab horses have a dissipated appearance, and stale odours taint even the early summer morning. Now we skirt the park, and a fringe of jewel-like beds, all set in emerald velvet, glow fresh and beautiful in the morning sun. But the pleasant picture disappears, and nothing reminds us of country life but milk cans and market carts, the latter laden heavily with all good things.

Paddington is reached; there is an awful crush for tickets, and at eight we are off on what turns out to be a long and for the most part tedious ride of fifteen hours. To the traveller for the first time, however, the rail from Dawlish to Penzance is interesting on account of the enormous engineering difficulties overcome by the genius of Brunel, and the very beautiful scenery along the line. At last we reach Penzance, and grope our way in search of an inn, whence we shortly remove into lodgings on the Parade—cheap, clean, and comfortable at—. No, I do not write to advertise, but to tell something of the Ferns, flowers, and fancies of this delightful county.

We consulted a borrowed copy of Murray as the best guide, in some respects, as to what to avoid. For instance, in the cave where the Maiden-Lair Fern grows so luxuriantly, who would expect to find a frond? Have not the Vandals spoiled it so that only a few tiny plants hide timidly, high out of reach, under the friendly shade of grasses and Briars? Let would-be botanists who begrudge the time and toil for honest search go away disappointed. We started westward early on Monday, soon reached the picturesque but unsavoury Newlyn, and under the grey rocks in the crevices of Tol, found our first frond of *Asplenium lanceolatum*, small and crisp, but distinct enough from its habit, divided pinnae, and spore cases, from *Asplenium-Adiantum nigrum*. We have found it since in great abundance all along the walls from the Logan Rock Inn to Gurnard's Head, but there is scarcely a hundred yards of wall (all the fields are walled), around Penzance, where *A. lanceolatum* does not grow. Devonshire lances have been much praised by tourists, but I do not admire them sufficiently not to wish they would let me see a little of the country they run through. Almost every yard of Cornish fence contains a painter's or a botanist's study. Lichen-stained stones of all rich hues, the lines between them filled with *Asplenium lanceolatum*, *A. Adiantum nigrum*, *Polypody*, *Lady Fern*, and *Bracken* at their base, and bunches of purple *Heath* on their summits, with a careless *Bramble* throwing a shadow across them; while bits of blue *Thrift*, and, perhaps, a *Foxglove*, give their sid in lighting-up the picture. Over the wall, perhaps, is the glorious sea, flecked with many a sail, stretching away to the dim purple line where it meets the sky.

There are various odours, mostly fishy, and notwithstanding the picturesqueness of sailors, and fishwives, and boats, and hanging nets, we walk on along the cliff. Here is a cottage perched on the rock, its *Enclisias* reach the roof, with stems the girth of one's thigh, and *Pear* trees laden with *Chaumontels*. What a feast in prospect! The road winds along the cliff; there is a strong scent of Almonds in the air, the *Tamarisk* flourishes, and a succulent that grows luxuriantly on St. Michael's Mount, hangs in masses from the wall on the right. It is a kind of

Mesembryanthemum, admirably adapted for rockwork. We peer over the cliff draped in wild flowers and Ferns, and just below us is a splendid tuft of *Osmunda regalia*. It grows plentifully all along, though not large; by the Gurnard's Head, however, in a watercourse, it is grand. There are fairy bowers of it over crystal pools of water that make us envious—one such to grace our fernery and we should be happy. But let us get down on the beach, it is hard climbing yet worth the trouble. Hundreds of plants of *Asplenium marinum* grow in the shady places under the cliff. It is an elegant Fern here, particularly when drooping, which seems its most natural habit of growth. The younger plants are best for potting; a light sandy and peaty soil suits it, and a little salt should be put in the water occasionally. For a greenhouse fernery it is most effective, but it will not grow out of doors unless within reach of the sea spray.

Past Newlyn is Mousehole, a fishing village, and reputed to be the hottest place in England. The cove, which is much visited, lies under the cliff beyond the village. It is difficult of access, but well worth seeing; the roof and sides are completely covered with *Asplenium marinum* and *Athyrium Filix-foemina*. The latter does not grow large, but has an elegant drooping habit, and contrasts well with the glossy dark green *Asplenium marinum*.

But here are Potatoes. This is where they come from long before they even make their appearance in the most sheltered spots round London. Potatoes and Cauliflowers are a specialty of the neighbourhood, and we certainly never tasted Potatoes so good and yet so handsome, and Penzance itself consumes an enormous quantity of them. Here is an old native at work in his plot. He is respectful but shy at first; then, as he becomes interested in our interest, he takes off his old straw hat, rubs his venerable pate, puts down the spade about 6 feet long, and tells us all about it. (By the way, the Cornish spade is surely a more scientific implement than ours, which requires so much stooping, and loses the valuable assistance of the knee as a fulcrum). His Potato garden is only about 30 yards by 10, and the crop, owing to the dry weather, is not large but excellent in quality. He points out that the manure, chiefly ashes, has not had the chance to decay; but the soil is good enough for potting, and two crops a-year are the rule, the second crop being Cauliflowers or Mangolds, which are transplanted of course to the Potato ground. Just along here for half a mile is the most favoured spot in Cornwall for early Potatoes and Cauliflowers. The plots are for the most part very small, many not 10 yards square, but sheltered by high hedgerows, chiefly Alder, or stone walls about 5 feet high. The sort almost exclusively grown for early market is Myatt's Prolific, which is much preferred to the Ashleaf, and sets are sprung early, planted in November, and frequently hoed before Christmas. The aspect, as my informant said, lay just in the eye of the sun, and was singularly exempt from frost. Last year Potatoes were dug in April, and brought 2s. 6d. per lb. in the London and Birmingham markets. The grower, we were told, sold £40 worth from a tithe of the land which he bought for £70. The late sort, or “keepers” as they are called, are Paterson's Victoria and Fikes. Paterson's, he assured me, were ousting the Flukes; they were “mar mealy and better crappers.”

We bid our old friend good day, and strolled on to the Logan Rock, an immense boulder of granite poised on the summit of grand sea cliffs. After gazing awhile on the tremendous precipices, and the beautiful and never-resting sea at their base, round which the sea birds floated and screamed, we turned our eyes landward and found some beautiful specimens of *Asplenium marinum*. A frond or two which we broke off 4 or 5 inches from the stool measured 2 feet 8 inches. There were probably finer specimens to be had for searching. From the coast for a few miles inland, the country is here singularly destitute of trees. The extreme violence of the south-west gales, I imagine, so strips and bruises the young leaves, that the trees do not recover from the attack.

I had forgotten to say that we passed in our journey the new telegraph station, and the beautiful cove of Lamorna. In the valley leading to the latter we found *Lactrea recurva*, with several other Ferns of less note. It is finer in Devonshire, however. In the neighbourhood of Clovelly there are miles of it, and certainly it is here the most elegant in form and colour of all the British Ferns. When grown in favourable situations it has a peculiar softness and bloom that I cannot describe, the result, perhaps, of the crisping of the edges of the pinnules. We found it all along under Cairn Galva, by the road side, and finest in the pits and sides of the old workings

of a tin mine. *Hymenophyllum tunbridgense*, which was said to grow at Cairn Galva, we could not find.

Our next halt was at Gurnard's Head, a bold rocky promontory stretching due north. *Asplenium lanceolatum* had accompanied us some miles, and once or twice we found it with fronds a foot long, but then only growing in deep interstices in the walls. When in a favourable position it is dark green, and most elegant in habit. To the left of the road down to the beach, having Gurnard's Head on the left, and below a raised platform for boats, we found an immense quantity of large *Asplenium marinum*, and the most elegant little cave it is possible to conceive.

A walk of six miles across from Morvah, brought us on the Wednesday evening to our lodgings at Penzance, and the change from north to south of the narrow peninsula was striking. The entire absence of trees and bareness and wildness of the country in the north are oppressive. The cottages have no gardens in front, and, indeed, few anywhere, but gradually as one proceeds south the trees appear dwarfed and lichen-stained at first, the Firs just tufted with a solemn green, their stems and branches almost white; then, gradually, as a friendly shelter is afforded by a hillside, Oaks and Beech begin to thrive; and as the warm valleys on the south open out to the sea, fine timber appears, and orchards loaded with fruit. Immense quantities of Black Currants, and small fruit are grown. Raspberries are 4d. a-pint; Gooseberries, 1d. "But what about *Adiantum capillus-Veneris*?" some of your readers will ask. Well, we found it one spot in great plenty though small. Thousands of young plants grew on the cliff round about. I must let your readers search. There are several places, however, where the graceful fronds nod in mockery from the cliff between St. Ives, and—there, I had almost said. When, however, your readers have searched so long and toilfully, they will be as loth to let the secret out as your obedient servant.—**PENCIL.**

THE MANUFACTURE OF TAR PAVEMENT.

Tar pavement may be made of the ordinary cinder-dirt produced in gasworks, of shingle, or of a mixture of both. The material is burnt in heaps like ballast, and when hot is mixed with hot tar. In practice a small fire of coke is made on the ground, and covered with cinder-dirt or shingle. When this layer is hot another is added, and so on in succession until a large-enough heap has been provided. The tar is now boiled in an iron copper, and taken when hot and mixed with the hot material from the heap already described, in quantities of two bushels at a time, in about the proportion of one gallon to every bushel of cinder-dirt, and slightly less than a gallon for the gravel. It is turned over and over with the shovel until every part of the material has got a covering of tar. Then the whole is passed through a sieve with $\frac{3}{4}$ -inch mesh, and part of it through another with $\frac{1}{2}$ -inch mesh, and put in heaps until required. Indeed, it may be kept for months before being laid down.

Before the pavement is laid, an edging should be provided about 2 inches thick, and projecting 2 inches above the surface of the ground to be covered, which should be tolerably even. It is advisable to have the ground next the curb well trodden on and rammed before the pavement is laid, otherwise there will be an unseemly hollow next the curb. In laying, the rough stuff is put down first and rolled tolerably firm, then the second quality is put on, then the third, and when the whole has been raked level, a little of the finest material is sifted on through a sieve with $\frac{3}{4}$ -inch meshes, and a little fine white shingle or Derbyshire spar is sprinkled on the top. The whole must now be well rolled. The best roller is a water ballast roller, which at first is used without ballast, and well wetted to prevent adhesion of the material, and when the pavement is slightly consolidated, the full weight should be applied.

For heavy cart traffic the material should be made of shingle only, heated and mixed as above, and well rolled. Both descriptions of pavement are laid best and most easily in warm weather, and should be rolled when the sun has warmed it well. Those parts in angles should be well rammed and rimmed off with a light shovel.

Though apparently a simple manufacture, there is a little difficulty in ascertaining the proportion of tar to gravel or cinder-dirt. A little experience will only be necessary in this, as well as in all other manufactures, to enable anyone to carry it out successfully.

This pavement cannot be spoken of too highly, as it is cheap,

wears well, and can be easily repaired. The colour, which never can be made to equal York flag, and the smell for some time after it is laid, are the only objections to its use; it can be laid with a good profit in any district at 1s. 4d. per square yard; and besides being a boon to the public, who must otherwise walk on gravel, is a great advantage to gas companies.—(Nature.)

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

TILLANDSIA LINDENIANA (M. Linden's Tillandsia). *Nat. ord.*, Bromeliaceae. *Lim.*, Hexandria Monogynia.—This, the largest-flowered of the genus, is a native of Brazil. Flowers violet-blue with white-based petals.—(*Bot. Mag.*, t. 5856.)

CYMBIDIUM CANALICULATUM (Channelled-leaved Cymbidium). *Nat. ord.*, Orchidaceae. *Lim.*, Gynandria Monandria.—Native of N.E. tropical Australia. Flowers purplish brown, and green edged, lip white with pink spots.—(*Ibid.*, t. 5851.)

MALOPE MALACOIDES (Barbary Bastard Mallow). *Nat. ord.*, Malvaceae. *Lim.*, Monadelphia Polyandria.—Native of southern Europe and north-western Africa. Flowers rose-coloured with crimson lines.—(*Ibid.*, t. 5852.)

ERITRICHUM NANUM (Dwarf Alpine Eritrichium). *Nat. ord.*, Boraginaceae. *Lim.*, Pentandria Monogynia.—Native of the entire range of the Alps. Flowers bright blue.—(*Ibid.*, t. 5853.)

ASIMINA TRILOBA (North-American Papaw or Custard Apple). *Nat. ord.*, Anonaceae. *Lim.*, Polyandria Polygynia.—Native of the middle, western, and southern states of North America. Fruit fragrant and eatable. Flowers brown, deeply reticulated.—(*Ibid.*, t. 5854.)

CYMBIDIUM CANDIDUM (Small white Lady's Slipper, or Mocasson Flower). *Nat. ord.*, Orchidaceae. *Lim.*, Gynandria Diandria.—Native of bogs of New York States, Kentucky, and Wisconsin, and further northward and westward. Flowers white with purple bands, lip dotted with the same colour.—(*Ibid.*, t. 5855.)

TULIP—*John Henry*.—It is white edged with dark purple. "Mr. John Hepworth, of Huddersfield, says—'The Tulip John Henry was raised from seed sown in 1856, the pod having been gathered two years previously from the No. 1 fine strain of that very old favourite Louis XVI., impregnated with a very fine seedling by bloemen breeder. From the same pod of seed I have obtained several other superb seedlings, not yet named.' Mr. Hepworth further states that no bulbs of this variety have as yet been parted with, nor will there be any for distribution before August, 1871, but should the stock at that time amount to one dozen good blooming bulbs of the rectified flower, it will then be in the market at the price of one guinea each bulb. The breeder, which in the breeder state is also a first-class show flower, will also be sent out at 7s. 6d. each. In case any untoward circumstances should intervene to prevent this number from being obtained by the time stated, the bulbs must be kept back till August, 1872."—(*Florist and Pomologist*, 3 s., iii., 169.)

LAWN MOWERS.

I WAS sorry to read the remarks at page 121 respecting lawn mowers. We have had for nine or ten years one of Messrs. Green's 24-inch machines, and I can safely say I cannot wish for a better machine for lightness and good work. It is worked by two men, who have three acres to keep in order. This machine we send to London once in three years to undergo repairs.

I am sorry to say we have one of the Archimedean lawn mowers. I have cast it aside after three months' trial, and I cannot make anything of it. The first time I tried it unfortunately it came in contact with a small stone, which made a great gap in the revolving cutter. Stones are not in their proper place on lawns, we know, but the keenest eye does not always see them until too late. I hope all those who have tried this new machine will give us their opinion, that we may know if the fault is behind the handles or not; if it is, we will try it again. I should almost imagine that the 16 inch machine which Mr. Daines has is out of order, if it cause hard work for two men.—**EDWARD COVENEY.**

[We think the correspondence relative to the comparative merits of lawn mowers had better cease. We have no doubt, in fact we know, that all those now manufactured do their work well. Which does it best—that is, which ribs least, re-

quires least labour, and is least liable to be out of order, can only be determined by comparative trials by a jury of competent, disinterested tryers.—Eds.]

ARRANGING FLOWERS.

It is astonishing how very few people know just how to display cut flowers to the best advantage. Everybody must have bright blossoms in the parlour vases now-a-days, but the combinations made are enough to vex the soul of a person with the least artistic taste. What business has a blue Larkspur—beautiful though it may be in itself—by the side of a Scarlet Geranium? or by what law are Marigolds and Roses brought together?

In the first place one must have the right kind of a vase, and I will give my ideas of the fitness of things. Vases should not be very high, unless they are wide-topped, in which latter case branches of foliage and tall spikes of bloom should fill them; for instance, either a ground glass or a ruby vase a foot high is well furnished by common Lily leaves, or leaves of Mountain Ash, with white Petunias, or any long-stemmed white flowers. Parian vases of the many pretty patterns are beautiful always; so are those of engraved glass. I have a little one of the Fern pattern about 6 inches high, which occupies a carved bracket over the sewing machine. This year it began very early to hold forest flowers—spring beauties—and Hepaticas; Violeta white and blue; then a handful of Adder's Tongues (*Orehis spectabilis*). Then came the garden flowers, of which I notice some pretty arrangements, Ribbon Grass, Pear blossoms and Tea Violets, Lily of the Valley, with its leaves and a single purple Pansy; a bit of white Lilac and Dielytra; Roses during their season; and now, since the fragrant Lilies of June are gone, I take very kindly to bright Geraniums and Verbenas, feathery sprays of Gypsophila, a little Mignonette, and leaves of the Rose Geranium, which I always grow in great abundance for bouquets, not forgetting a stem of the variegated Balm, which always harmonises with scarlet or crimson flowers. A couple of Fern fronds (*Aspidium acrostichoides*) and the delicate Hare-bell are pretty together, or Hare-bell and white Spirea; St. Peter's Wreath, bent so as to simulate a basket handle, and flowers of any hue filling the basket. A great Datura may be put in a narrow-mouthed vase, and this natural vase, with water in it, may hold a cluster of delicate blossoms.

Some flowers show best in plates; saucers of Pansies edged with Musk are lovely; so are Balsams with plenty of their own leaves. Fill a pickle-shell with Caraway leaves, put a white Jonquil in the centre, from which let five sprays of Lily of the Valley radiate; or a star may be made of Daisies and Myrtle; or of blue and white Larkspur. Verbenas as well as Phloxes are prettiest when looked down upon. Many of the Grasses mingle well with flowers, and they are so graceful that a whole bouquet of them is not to be despised. Ferns, too, all by themselves, are very pretty. I saw them in a church lately, so bravely green, so delicate and airy, that I doubt not other eyes than mine found them a rest after looking at the round bunches of strong-hued flowers standing near. Sedges and Ferns are especially pretty before a window, where one can get the full effect of their delicate outlines. Nothing is prettier than a small basket of Ferns in a window with plenty of bright Cardinal Flowers.

Late in the autumn one is often so luckless as to have many unripe Melons. Cut off the bottom of one so that it may stand firmly in a soup plate, surround it with stiff foliage, Pæonia for instance; then stick the Melon full of Dahlias or Asters. This makes a symmetrical bouquet, and is the most satisfactory way of treating Dahlias, which I have found exceedingly difficult to manage otherwise.

I have only hinted of my subject after all. One needs to study flowers, their manner of growth, their affinities, their prominent traits, and then one would not bunch them together stiffly and destroy their individualities. Give them a place upon the dining table every day; let them stand before you when you work or read; wear them in your hair when you go about your work; and some of their grace and fragrance will surely sweeten your daily life.—(*Rural New-Yorker*.)

NEW FLOWER MARKET IN LEICESTER SQUARE.—There is a talk, which we earnestly trust may ripen into action, of making Leicester Square a flower market. A more desirable change could not take place, desirable not only in an architectural and æsthetic sense, but on moral and sanitary grounds. Perhaps

within a year or two we may see that desolate gamin-haunted area covered with pretty buildings and a bright array of flowers, whose perfume will replace the unsavoury odour which now prevails the square, and whose presence will assuredly induce a purer and more respectable moral atmosphere. Covent Garden, too, which has long suffered from reptation under a badly arranged system, would find no little benefit from such an establishment as is now proposed.—(*Food Journal*.)

FRAGMENTS.

WELL, I am away from Redcar, and what may be called Captain Cook's district, for I learned that the father of that circumnavigator was buried at Marske; the Captain was born at Marton; he was apprenticed at Staithes; his brothers and sisters are buried at Stokesley, where also his mother rests, and whose shoe is preserved in the Kirkleatham Museum—all villages around Redcar. I am away from the district, have wandered since to the north and south of it, but having rested nowhere remember only some fragments, disjointed and superficial, that may be deemed worthy of filling a gap in your columns; first among which is of and about Durham, that city associated from childhood with Mustard. Mills for its grinding I saw there; but why it should there be a speciality is probably not known to many of your readers—no fields devoted to growing Mustard seed are to be seen; but it is said that Charlock seed was the original seed used for Durham Mustard, and I saw too much of that weed in some of the Durham fields.

Prior to 1720 no such luxury as Mustard, in its present form, was at our tables; the seed was only coarsely pounded, as coarsely separated from the integument, and in that rough state prepared for use. In 1720 it occurred to an old woman of the name of Clements, resident at Durham, to grind the seed in a mill, and to sift the meal as in making flour from Wheat. The secret she kept for many years to herself, and supplied the principal parts of the kingdom, and in particular the metropolis, with this article; George I. stamping it with fashion by his approval. Mrs. Clements twice a-year travelled to London, and to the principal towns throughout England, for orders, and the old lady contrived to pick up, not only a decent pittance, but what was then thought a tolerable competency. From this woman living at Durham, it acquired the name of Durham Mustard.

Of all the genera of residences scattered over England, none ever have been so inviting to me as those old-fashioned family residences, setting all architectural rules at defiance, that have been compounded from time to time by successive generations without regard to any consideration but the present requirements and comfort of the occupants, until, at last, no observer can detect which is the centre, for it seems all wings. Just such a residence is Ayley-heads, near the Mustard capital. A residence is known to have been on the present site for five hundred years—Alan de Billingham in 1371 was possessed of land at "Akelyheads" in right of his wife Agnes—and though that, and probably many successors have been levelled, yet the existing house bears evidence by its long passages, many divisions, panelled rooms, and decorated ceilings, that it has had many generations within.

Ac, is the Anglo-Saxon for an Oak; *legh* or *ley*, for a stead or place; and *heafd*, for a head, and I accept such a derivation, for the house commands an extensive view from the highest of a series of elevations, and in a place of fine Oak and Beech trees. It is not a show place, but the grounds are well arranged, well kept up, and where one can glean useful facts and suggestions. The owner (one of your editors will say "of course"), is a Johnson, and asks questions of Nature. He has been a planter and replanter of evergreens for some thirty and more years, and he showed me Hollies, from 6 to 12 feet high, that had been transplanted one, two, and three years, all doing well, and all removed in June, just when the buds for the year's growth are beginning to burst. He says they never fail them, care being taken to have a good ball of earth about the roots, and, when placed in the hole prepared for them, covering them with earth, then soaking it with water, and finally filling in the remainder of the earth. I saw there also a direct proof of the good influence of mulching the roots of old fruit trees. The soil is light, and some Apricot trees about thirty years old had latterly shed their fruit unripe during dry summers. The surface over their roots had been mulched this year and well watered. The soil beneath the

maturing never dried, and the Apricots, a good crop, were ripening, and none had fallen.

There is a terrace before the house, and flanking a portion of that terrace is a Yew hedge about 6 feet high. This forms a good background to a ribbon-border, the rows in which are Hollyhocks, Dablias, dwarf Roses, Perilla nankinensis, Scarlet Geraniums, yellow Calceolaria, Lobelia speciosa, and white-edged Saxifrage, but this last is too tufty, and Arctotis reptans, old Donald Beaton's "frosted-silver plant," would be more effective.

In the vicinity I had great pleasure in conversing with the author of one of my favourite works, "The Land of Israel," the Rev. Mr. Tristram. He gave me much information relative to the Holy Land, and I would gladly have asked him about its Pigeons and poultry, just to gratify his brother cleric, "WILTSHIRE RECTOR," but I remembered the story of the farmer to whom a reverend Palestine traveller was relating the discoveries in and about Jerusalem, stopping the interesting narrative with the inquiry, "Beg pardon, Sir, but how be's the Turmetts out there?"

"Up and away from Palestine," and my next remembrance is of Barnard Castle, from whence I rambled among the herds of red deer at Raby Castle; hung admiringly over the ruins of Atherstone Abbey, and the views of the Tees from the battlements of its bridge; lingered at Wycliffe, the place of origin of our great Reformer—great in the eyes of all Christians, for he struggled for what he considered the truth; but I rested at night at the King's Head, going ever and anon to walk in the gardens around, and on the ramparts of the ruins of Barnard Castle, which are visitable from the yard of that most comfortable hostelry.

There are some flag stones near the entrance of the keep of the Castle, and having ascertained that they covered the entrance to the dungeons, I inquired if they were visitable, and was told in the negative, and that Mr. Charles Dickens had

similarly inquired. This led to further talk about our great novelist, and I found that the garden and ruins had been his frequent resort whilst making inquiries about the "Do-the-boys-hall" schools; and that my sitting-room, like his, directly faced the house on the street's opposite side, which led to the adoption of the well-known title, "Master Humphrey's Clock." Of that house I append a sketch, and regret that I could not converse with its owner, and Mr. Dickens's correspondent, in-

asmuch as that he died some twelve months since. The watch-making business is still continued by his widow, and there is an old-fashioned appearance about the shop's contents, in the window being suspended, among other old-world things, a preponderating number of those little fat watches, looking as if poached in silver.

Last of my reminiscences must be of Whitty and its associations, prominent among which is its jet. Few wearers of the ornaments of which it is the material are aware that it is only a variety of coal, and, like it, is only wood reduced to charcoal under a high pressure in some former volcanic conflagration. Jet in some way owes its peculiar characteristics to its being the coal formed from coniferous trees. I have a piece of rough jet in which the annual-formed rings of the Conifer are plainly marked.

Next among my Whitty memories are the ruins of its Priory, and its history adds to the testimony, that though the failings and excesses of the monks were many, yet they were national benefactors; they promoted literature and the culture of the soil. Even their excess in luxurious living induced attention to the rearing of superior animals for the supply of the refectory. Some notes relative to Whitty Priory, notes gathered from Domesday Book and the Priory's Register, afford confirmatory evidence. They show that the Priory lands alone were cultivated in the manor of Whitty, all the rest were waste. The Priory poulterer was an officer of sufficient position to have a horse allowed him. No gardener is mentioned, but, as at the Abbey of Evesham, it was probably managed by the Priory almoner. That gardens were cultivated in the vicinity is testified by their tithes rendering to the Priory 6s. 8d. annually.

A ramble to the woods of Mulgrave Castle closed my summer's holiday. The roads through those woods are truly delightful and very varied; they extend for many miles, and were chiefly formed by Maharajah Dhulep Singh whilst tenant of the estate, but it is now again inhabited by members of the family of its owner, the Marquis of Normandy.—G.

GARDENING IN THE LONDON PARKS—No. 2. HYDE PARK.

NEATNESS is one of the leading principles in the management of dressed grounds. Gay, well-filled flower beds, handsome shrubs, and so forth, are things to care for, and to each a proper share of attention must be devoted; but without the greatest possible care in the maintenance of order and cleanliness, both among the plants and their surroundings, little enjoyment is likely to be derived from them, however beautiful they may be. The importance of this principle appears to be fully recognised by the superintendent of the flower beds in Hyde Park, for one cannot fail to notice the exquisite neatness which prevails both in the flower beds there and in their surroundings, all of which were in the best possible condition in this respect at the time of my visit, August 5th.

The outlines of the whole of the beds in Hyde Park are simple in the extreme, and rightly so too, for the flower garden, if I may so call it, consists of a series of long, narrow strips of turf, on which are the beds, extending from the Marble Arch to Stanhope Gate by the side of Park Lane. A detailed description of the whole of these beds would offer but little to interest your readers, I shall therefore confine my notes to a description of a few of the more striking beds, or those which, by the excellent arrangement of their occupants, are worthy of imitation.

Some good circular beds had an outer row of *Sempervivum californicum*, inside which was a row of Golden Feather *Pyrethrum*, with a compact central mass of *Coleus aureo-marginata*. These beds had a neat effect, but others, having crimson *Amaranthus* instead of the *Coleus*, were much brighter. The turf on which are the principal beds narrows to a point at the end close by the Grosvenor Gate. At its extremity was a charming little heart-shaped bed, the soil of which, as in most of the other beds, rises so abruptly as to form a miniature ramp; on the face of this is a row of the neat *Echeveria secunda glauca*, a row of Golden *Pyrethrum* coming next, with a centre of *Coleus Verschaffelti*. The surface of this bed was not decidedly flat, but by the skillful pinching of the *Coleus* it was made to rise very gently to the centre. Nothing could surpass the exquisite neatness of the bed, which was as near perfection as possible. From it a series of parallelogram beds is continued for a long distance. The formality of these long lines is broken

about halfway along them by a group consisting of a large oval bed of *Rhododendrons*, on each side of which, in a line with the other beds, were two small hearts, with a circle of proportionate size between them, making six beds besides the large oval. In the small circles was a central mass of *Alternanthera magnifica*, surrounded by a row of Golden Feather *Pyrethrum*, with a broad border of the very dwarf grey *Antennaria tomentosa*. Each of the heart-shaped beds had a central mass of *Coleus Verschaffelti*, surrounded by Golden *Pyrethrum*, with an outer row of *Echeveria secunda glauca*. The high finish of these beds left nothing to wish for, and the arrangement of the plants was most satisfactory. *Alternanthera magnifica* has handsome orange and crimson foliage.

Of the long narrow beds, I may mention as being very good one filled with *Pelargonium Christine*, having an edging of alternate plants of *Lobelia speciosa* and *Pelargonium Lady Plymouth*; another with the same kind of edging, and *Pelargonium Waltham Seedling* in the centre; and another of *Pelargonium Amy Hogg*. There were several side beds of *Calceolarias*, but all had a very poor appearance. A quantity of the dull ragged grey-leaved *Artemisia Stelleriana* was very tame indeed. A number of long narrow beds had edgings of alternate plants of *Lobelia speciosa* and *Dactylis glomerata variegata*; inside this was a row of Purple King *Verbena*, with various kinds of variegated *Pelargonium* in the centre. This was rather an unsafe arrangement, but as the *Dactylis* predominated very much, the blue and purple did not clash sufficiently to materially affect the appearance of the beds. In some mixed beds of *Viola cornuta* and variegated *Pelargoniums* the *Viola* was a decided failure, its weak straggling growth being almost without flowers.

Of eleven beds which I noted as containing each a variety of variegated *Pelargonium*, one containing Queen of Queens mixed with *Verbena Purple King* was very good; *Artemus Ward* was very dull. Golden *Fleece*, free in its growth and with bright-coloured foliage, was good, but it is not by any means equal to *Crystal Palace Gem*, of which there was a fine mass. Some of these beds would have had a much better effect had the blossom been kept picked off the plants. Some rows of *Verbenas* introduced in several mixed beds were very poor indeed, with very few flowers. The beds of various Zonal *Pelargoniums* were well filled, but the flower trusses had been so battered by recent showers that I was quite unable to form a fair opinion of their merits. The uniform appearance of the fringe of *Sempervivum* or *Echeveria*, which surrounds most of the beds here, imparts a finish and contributes very materially to the air of neatness which pervades the whole of them.

On the side of Rotten Row, near Hyde Park Corner, were a few noteworthy fine-foliated and tropical plants. Of these two very fine groups of *Canna discolor* bordered with *Tussilago Farfara* variegata, the variegated *Coltsfoot*, had a most striking effect. Good specimens of *Monstera deliciosa*, *Musa Ensete*, the graceful *Phoenix dactylifera*, a fine *Scaevola robusta*, *Phoenix reclinata*, *Lantana borbonica*, and the singular and striking *Phormium tenax variegatum*, all presented a healthy and flourishing appearance.—EDWARD LUCKHURST, *Egerton House Gardens, Kent*.

WORK FOR THE WEEK.

KITCHEN GARDEN.

GROUND now becoming vacant should be trenched up as roughly as possible, manure being applied if necessary. This should always be done as soon as the crops are off, whether the ground is wanted immediately or not. Trench and manure well for the winter *Cabbage* in due time, and plant out some more strong plants of the early kinds for late *Coleworts*. Young seedling *Cauliflowers* must not be allowed to stand too thickly in the seed bed; the thinnings may be pricked out at sufficient distances, and will make sturdy plants. If any strong *Celery* plants remain, they may be taken up with balls and "heeled" deeply for soup purposes; this will save the stock for salads. Plant out more *Endive* for the last batch, using high slopes, which may be protected by covers or hoops and mats in severe weather. Sow Hardy Green *Lettuce* on sloping banks to stand through the winter. These banks may be rather small, not more than 4 feet through at the base, and steep; sow on both sides of the bank, and it will produce a succession. See that *Spinach* is properly thinned and the surface stirred. Make a good sowing of approved sorts of *Radishes* for winter use. Let all the *Scarlet Runner* pods be picked clean, except a few for seed; if allowed to grow old they exhaust the crop much, and

prevent succession. Thin *Turnips* in due time, and pass the hoe among them.

FRUIT GARDEN.

Fig trees out of doors should be liberally supplied with water if no rain ensues, to enable them to swell off the late fruit. Give a final nailing to all wall fruit trees, that there may be nothing to obstruct the perfect ripening of the wood. Fruit of every sort should be gathered as it ripens, and not be allowed to fall. Grapes out of doors should have every shoot of useless wood removed, and the branches laid in close to the wall. Wherever it is practicable, it is of great advantage to them to place the spare lights from early Peach houses or vinerias against the wall; when this is done, a good crop of fairly ripened fruit may often be obtained.

FLOWER GARDEN.

It will be well to fill up many blanks in flower borders as soon as possible with plants of a biennial character, such as Wallflowers, Sweet Williams, Campanulas (the *Campanula grandis* is a useful sort), Hollyhocks, biennial Stocks, and the various Primulas. Most of these, although somewhat old-fashioned, will be found very useful next spring. All spare time will now be probably employed in the reserve garden, as success during the spring and summer months depends in a great degree upon the efficient manner in which the labour is performed just now. Still continue to propagate showy and choice herbaceous plants by cuttings and division of the roots, and seedlings of late-sown perennials may still be pricked out with advantage. Pot off a good number of the different varieties of Brompton, Giant, and Queen Stocks; likewise Pentstemons, Antirrhinums, Linums, Viscarias, &c., that they may have a little protection should the winter be severe. Continue to plant out Pinks, Clove Carnations, and rooted cuttings of hardy herbaceous plants in nursery beds. See that the plants already established in beds are kept in a state of health and vigour by stirring the surface of the soil. Look now and then at the late-budded Roses, and loosen the ligatures; when necessary, pinch back to half their length those buds which have made shoots. If left at full length they are apt to be blown out by the winds. Remove all shoots and suckers from the stock; if left too long in their present position they have a tendency to weaken the constitution of the stock. Roses budded last year will likewise require attention. See that the heads are well secured against high winds, which generally prevail during this month and next. The early Carnation layers are now well rooted. In potting them off, either one or two plants may be placed in each pot, according to the convenience which the amateur may have for wintering them. Care must be taken not to have the soil too light, and manure or any stimulating composts must be avoided; in fact, the soil cannot well be too simple or pure; decayed turf with a little sand is found to be the most suitable for their winter's growth. Procure varieties from the different cultivators, so that they may be well established before winter. The offsets of all choice sorts of Tulips may be put into the ground as soon as convenient, choosing fine dry weather for the operation. It will be found a good plan not to let the beds have too much moisture, hooping them over, so that mats or other protecting material may be thrown over in excessive wet. Where Pinks have been planted out in beds, they must be kept free from weeds, and old stools or stock plants which have been grown in pots may be planted out on borders. They will produce an immense number of flowers next season from which much seed may be saved. Make up beds of rich compost in rather a cool situation, and plant out rooted cuttings or young plants of Pansies for next year's blooming. Continue to shelter Dahlias, and to thin the buds as before directed.

GREENHOUSE AND CONSERVATORY.

Clerodendrons, early Camellias, well-grown Fuchsias, trellis climbers, Brugmansias, Scarlet Geraniums, &c., should now be in high perfection. The *Veronica speciosa*, and *Buddlea Lindleyana*, where properly grown, will also prove very interesting, as tending to sustain the true conservatory character. The two latter shrubs want very similar root treatment. Nothing of a stimulating character will bloom them in perfection. A plain simple loam, of a rather sound character, will be found to suit them best, accompanied by the one-shift system of potting. Luculias, and other winter-flowering plants growing in the border, must be freely exposed to light and air in order to have the growth well ripened, and to insure a fine display of bloom. Also, see that all plants are clear of black thrips, for this pest is particularly active at the present season, wherever

it is allowed to gain a hold, especially on *Luculias* and plants in a growing state.

STOVE.

Where there is but one house for the accommodation of tropical plants considerable care and attention are necessary to properly manage these at this season, as some having completed their season's growth require to be kept cool and rather dry, in order to ripen the wood, while others in free growth require to be encouraged with warmth and moisture. If there is no convenience for removing to a cooler house such plants as have made their growth, these should be placed together at one end of the stove, keeping them sparingly supplied with water at the roots, and giving air rather freely, which will generally serve to prevent any attempt at second growth; and those requiring to be kept warm and moist should also be placed together at the opposite end of the house, where very little air should be given, using every care to keep the atmosphere moist about them. *Allamandas*, *Clerodendrons*, &c., which have done blooming, may be removed to ainery where the Grapes are ripe or ripening, for as these will require very little water, they will not do much mischief in the way of causing damp, and their room in the stove will be found very useful for other plants. See that everything is free from insects, and keep the foliage of *Ixoras* clean by washing with a sponge and soapy water when necessary.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

In our greatest extremity, when we could obtain no water of any sort except what we carted from three to four miles, we had on the evening of the 22nd the most genial refreshing rain of the present year, and it came so softly that, whilst refreshing the parched soil, it did nothing to injure the masses of *Geranium* and *Calceolaria* bloom. On this, the 27th, there are yellow-tinted fleecy clouds in the west, which, with a falling barometer, give us hopes that we shall have more rain, and if so, then we may shortly expect a green carpeted lawn to set off the masses of bloom and to give additional crispness and succulence to all our vegetables. On the whole, in the kitchen garden, notwithstanding the heat and the extreme dryness, we shall not suffer so much as we expected, except in the case of Peas. We fear that they are gone beyond recall, though after the rain some of the rows seemed as if they would break afresh, and we shall leave them a little longer to see what they will do. The want of Peas in September is a great want indeed, but in this respect we believe we are no worse off than the generality of our neighbours, even in cases where water could have been had in abundance. The Peas, even in our case, suffered more from the dry, hot atmosphere, than from excessive dryness at the roots. A good syringing or engining over the tops, could it have been given, would have been more beneficial in many cases than watering with cold water at the roots.

Dwarf Kidney Beans and Scarlet Runners.—The loss of the Peas made us more anxious about the Kidney Beans, and in the case of both, and especially the Dwarf Kidney Beans, we had the rows gone over and every Bean arriving at the seeding state cut carefully off, that the strength of the plants should be thrown into the free production of young succulent Beans. In small gardens, where the greatest table supply from the smallest space is most desirable, it is scarcely worth while to save the seed, and if attempted, it is best to set aside a little piece for bearing seed, so as to have it well ripened. Amateurs should keep in mind, that a couple of Kidney Bean pods left on a plant to perfect their seeds will exhaust the plants more than a score of pods gathered when young and juicy. Such pods can scarcely be too young, if grown a little beyond the half of their full size. They should never be so old as not to break across freely, if they are expected to cook well. The incipient seeds should never be more than visible. The almost universal custom is to cut and shred even young pods before boiling, allowing much of their nourishing properties to escape into the water. We wish some of our readers would try boiling young Beans from 3 inches long, doing nothing to them except nipping the stalks and points off, and then report their opinion of the richer flavour of the dish.

Broad Beans, though excellent when young, and a fine standing dish when full grown and associated with bacon, are not appreciated, because not tried, as they ought to be, when the pods are young—just when the seeds are forming inside—the pods boiled whole, as indicated above for young Kidney Beans, and cut at table into the sizes most suitable for convenience.

In this case, as well as the young Kidney Beans, the peculiar richness is greatly owing to the inside of the Beans coming but little in direct contact with water. We shall be glad if a hint in this direction prove useful or suggestive. We have no doubt that very often the simplest mode of doing anything will turn out to be the best.

Vegetable Marrows.—Not long ago we saw a housewife pare off the outsides or skin of young Vegetable Marrows, preparatory to boiling them. She also cut them open. We did not wonder that the lady called them poor, watery stuff at the best. In our opinion they are one of the richest delicacies grown—so rich that we rarely taste them above once a year, but we should have had no desire to taste those thus peeled previously, so as to let the water thoroughly soak them. There are many ways of using this well-named Marrow, by boiling, frying, &c., but few modes for simple people are better than the following:—Select the Marrows when young, say from 6 to 8 inches long, and from 2½ to 3½ inches in diameter, cut them with a good long stalk, and if clean they need nothing more; if there should be a little soil, &c., rub or wash it off without grazing the skin; place them in boiling water with a little carbonate of soda in it; try with the point of a fork once or twice to see that they are done enough, but not so deeply as to let the water inside. When done slice them down the middle, and remove the soft inside, and then a little pepper and salt added, with or without melted butter, will yield a dish a king might envy. We never tasted a Vegetable Marrow where the water was permitted to get inside freely but we considered it spoiled. Good cooks, of course, can make them nice, however done, just as they could make delicious soup from flints with the good things they could add to the flints; but as Vegetable Marrows are rather plentiful this season, it may not be out of place to tell how they may be made most delicious. Even when they are grown to a large size, as in some cottage gardens, along with Gourds, for pies and puddings, the cottager might have many a dish from thinnings of the young fruit, as a plant will seldom bring many of a large size to maturity. To obtain this large size we have been mortified to see dozens of young fruit thinned out and thrown away, when even a little pepper and salt and boiling water would have turned them into a delicious dish; they are so rich that it is not every one who can partake of them very often, unless cooked in the simplest manner.

Winter Vegetables.—Thanks to a little sewage just at the roots, and frequent surface-stirring and forking, the earliest are more forward than we expected them to be, and after the refreshing rains of Monday, we turned out a quantity of Broccoli, Coleworts, Borcoles, &c., drawing deepish drills, and giving a little water along the drills after planting. Some of the plants, from standing rather long and thickly in the seed beds, had become somewhat leggy, and these we planted chiefly with the help of a crowbar, so as to get the roots deep enough. This was especially the case when we filled up the spaces between rows of Gooseberries and Currants, and where we should not have liked to have dug the ground too deeply, even in the middle of the space. It is always well to have plenty of plants in winter, even if one should pull them up early in spring. It was useless to plant earlier in the weather we lately had, and we did not think there was any occasion to hurry, as the first plantings-out were doing well.

Cauliflowers, after the rain, are becoming what they ought to be, and we hope they will form compact heads now, instead of spreading and shooting, as they did in the hot weather. In a piece planted in an earth pit, the greater part of which is now removed, and the space filled with Savoys, &c., even though assisted with sewage water, hardly a third came with compact heads; the rest shot away like a bad kind of sprouting Broccoli, good enough for hall purposes, but quite unfit to send to the dining-room. We planted out our last piece, to which we shall most likely give a little protection.

Most of our earth and turf pits, which we use for hardening off our bedding plants, are now filled with Lettuces, Little Pixie Cabbage, Rose Coleworts, and the Ulm Savoy beginning to heart well, and looking vigorous now, though standing merely one foot apart. All these we shall get off early in winter, as we should not be able to keep four-footed depredators from them, but they will give a great relief to the vegetables grown inside the walls. We have planted part of what we intend for our earliest spring main crops of Cabbage, giving such compact kinds as Veitch's Matchless 18 by 9 inches, and a larger kind, alluded to previously, 24 by 15 inches. We could hardly say which is the more profitable where there is a large consumption. A head of the latter is a regular fill-basket when well

grown. Two or three of the former, just when hearting and becoming a little white in the centre, look very well on a gentleman's table.

Our main last spring quarters of Cabbages were very stunted and blue in the hot, dry weather, and we used younger plantings, chiefly because they were sweet, soft, and succulent; but now after the rain these old quarters are much improved, and in an ordinary winter we shall be able to cut plenty from them. In going through the rows we noticed that the bulk of the stumps were producing from five to twelve young Cabbages, and as they are removed more will come. We like young Coleworts very well; they are nice from October and onwards to the spring, but even planted from 10 to 12 inches apart the yield is small in comparison with that obtained from an old Cabbage bed. Lately we have heard and listened to advice to destroy the old Cabbage quarter and depend on younger plants, but we would like all who consider the question of profit and loss to think twice before clearing away such a source of a large continuous supply in winter. We generally allow ours to stand all through the winter until we want the ground for Peas and Celery trenches.

Celery.—We were obliged to shade the beds we planted in order to keep it alive, and even with some showers we shall be later than usual. The chief bulk is still unplanted, because we could shade and even water where it was growing thickly in beds, which we could not easily do when transferred permanently to the trench beds. Fortunately the plants were pricked out rather thinly, are now strong and luxuriant, and as they will lift with large balls they will suffer but little from the removal. We must, therefore, vary our practice according to circumstances. With so little water, if these plants had been transferred to the trenches we should have expected the most of them to have started into bloom from mere dryness. We shall be both surprised and disappointed if one per cent. of these plants, after being turned out, should bolt; and as we expect to have more moisture in the autumn the plants will grow very fast and vigorously. September is the great month for Celery growing. We have earthed-up none as yet, though in general we used to be taking up long before now. At one time it was judged necessary to have large fine Celery at least by the middle of July, but it could not be had large and fine so early without a good degree of forcing and no lack of moisture.

Mushrooms.—Owing to necessary repairs in the Mushroom house we shall not be able to commence there for some time; and not wishing to have a break in the supply, if we can obtain water enough to wet, heat, and partially decompose a lot of dryish litter, we think of making a bed or two out of doors in the old-fashioned ridge or triangle form. At the present time we would not make these ridges large, as then they would be apt to retain the heat too long to enable us to spawn them quickly. For a bed to stand through the winter they ought to be larger, say at least 4 feet wide at the base, and 3½ feet to the apex. With good covering to keep out cold and wet, we have never had better Mushrooms than from such out-door ridges. Of course there was trouble in uncovering and covering. For a temporary purpose, such as we propose, we should be satisfied just now with ridges 30 inches wide and 24 inches in height, made of rather more than half-decomposed dung, and then a couple of inches or so of droppings added all over. We are rather inclined to this because we cannot make up our mind to follow the usual rotation in the open shed, which we use for summer cropping. The first summer piece has there been bearing freely for about six weeks; the second little piece is showing here and there like pin heads, quite as soon as we wanted. What would have been the third piece is occupied by a bed made just a twelvemonth ago, and which produced freely in October, November, and the first part of December, and then was pretty well neglected, as the house beds gave us plenty to go on with. This little bed, as witnessed by some of our leading gardeners the other day, is a proof that many of the failures with Mushrooms are the results of mistaken kindness. This bed was neglected during the winter, and in a cold night, though a little was left, the chief part of the covering over it was removed to protect other things. In the spring the other beds in the shed were turned out for compost-making, top-dressing, &c. In coming to this little bed the man who attends to the Mushrooms drew our attention to the freshness of the spawn. He cleaned the surface well, made a few little holes, and gave the bed a good watering with warm manure water at about 100°, covered it up with a little hay and litter, as far as we recollect, about the end of April, and from the end of May and the middle of June we have gathered freely, and

there are good Mushrooms now at the end of August. Of course it has not equalled in yield the first bed put up in the shed this season, but it still yields enough to render it a little imprudent to turn it out for the sake of immediately making a new bed. As far as we recollect the flat bed is about 16 inches deep, and the bulk of it is short dryish litter, with a casing of about 3 inches of droppings. No doubt the rest in winter helped it to produce this summer. All we can say is the Mushrooms were very acceptable, as they came in well when those in the house were becoming rather thin in texture before the first bed in the shed was ready.

We have frequently alluded to the simplest modes of obtaining Mushrooms. Perhaps the chief cause of failure is a want of patience. The material must not be spawned too hot. It is easy to give a little heat, when necessary, by covering, watching that the covering does not make the bed too hot. Of all materials we prefer horse droppings, with nearly an equal amount of short litter—not too much wasted, decomposed, or dried previous to use.

For ridge beds, nothing is better than dryish half-decomposed littery dung, such as is often obtained from the linings to hot-beds. One of the best beds we ever had in a shed was made of equal parts of stubble, longish dryish litter, and rather long green grass. We relied on the grass to give a certain amount of moisture to the other materials, and also a fair amount of nitrogen. These materials did not heat very strongly, but, as they were well mixed, enough to consolidate them when trodden and beaten. When the heat was on the decline, 2 inches of droppings were added and well beaten, and when the heat was suitable the bed was spawned, and in a few days earthed-up. When that bed was turned out a year afterwards one could still see the straws of the litter and the stubble, and over every straw the spawn had spread like a network. As already stated, we think horse droppings are the best, but we mention the above fact merely to show those short of the best materials that they may make the most of what they have. In fact, we do not see why every farmer who has an empty stall, a piece of shed unused, or a piece of a cellar unoccupied, should not have Mushrooms pretty well all the year round if he can obtain the material and exercise patience—that is, neither spawn too soon, nor earth-up too soon. Heat destroys ten times more beds than coolness and all other causes put together. To give too high a temperature to Mushroom spawn is just as wise as bringing a plant from alpine snows, and expecting it to flourish in a tropical hothouse.

The rains of Monday evening enabled us to roll and consolidate firmly the walks in the pleasure ground treated as alluded to last week.—R. F.

TRADE CATALOGUE RECEIVED.

William Paul, Paul's Nurseries, Waltham Cross, London, N.—*Bulb Catalogue for 1870.*

TO CORRESPONDENTS.

* * We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

TAN MANURE (*Subscriber*).—Spent tanners' bark used as a horse's bedding, and consequently mixed with his urine and droppings, is an excellent fertiliser. The fresher it is used the better.

KEEPING WALNUTS (*A Subscriber*).—When quite ripe and out of the green husk, put them in stone jars or zinc-lined boxes, in alternate layers with moderately dry sand, and keep them in a cold cellar.

PINE SAWDUST AS A MANURE (*J. N.*).—There is nothing in red Pine sawdust to render it injurious as a manure; and soaked and mixed as you mention with the excrements either of horses or pigs it would be a powerful and enduring fertiliser.

MALVERN HALL MELON (*W. S.J.*).—It is a scarlet-fleshed kind of fine flavour.

SEEDLING BRONZE PELARGONIUMS (H. E. A.).—Your seedlings are very pretty, but there are many like them, and they are not distinct from others now in cultivation either in the foliage or colour of the flowers.

SELECT PELARGONIUMS (A Subscriber).—*Show.*—Hercules, Llewellyn, Attraction, Archbishop, Captain John, Heribond, Hermit, (Foster), Emperor, Sœur de Charité, Progress, Empress, Maid of Honour, *Spotted Pelargoniums.*—Amy Robert, Guillaume Severyns, King Arthur, Eugene Daval, Landseer, Monsieur Rougère, Dr. Andry, Monsieur Boncharlat, Nabob, Spotted Gem, William Bull, Madame Charles Keteleer.

ZONAL GERANIUMS FOR POT CULTURE (Idem).—Jean Sisley, Lord Derby, Clipper, Surpasse Beauté de Suresnes, Provost, Leonidas, Glow, Rev. H. Dombraïn, Excellent, Warrior, Rose Rendatier, Cheitain.

HYBRID PEARL-FLOWER ROSES FOR POT CULTURE (Idem).—Antoine Ducher, Duchesse de Caylus, General Jacqueminot, John Hopper, Jules Margottin, Madame Victor Verdier, Mdlle. Bonnaire, Mdlle. Thérèse Lovet, Senateur Veisse, Victor Verdier, Fisher Holmes, Marechal Vaillant.

SELECTED FLOXES (Idem).—Madame Barillet, Mdlle. Hortimo de Tancenne, Comtesse de Chambord, Comtesse de la Tabouze, Monsieur Lienden, Monsieur C. Turner, Queen Victoria, Monsieur Malet, Madame Marie Saison, Madame Froment, Madame George Edith.

SELECTED ANTIARRHINCUS (Idem).—Algeria, George Gordon, Oheron, Rosa, Yellow Gem, Pretty Polly, Admiral, Grand Duke, Leopard, Nonpareil, Udine, Gladiator.

LILIUM LANCEFOLIUM (D. White).—Album and Rubrum are varieties of the same species.

WINTERING BREDDING GERANIUMS IN A MELON FRAME (An Amateur).—We do not consider that Melon frames, or indeed frames of any kind, are suitable for wintering such kinds of Geraniums as Cloth of Gold, Bijou, Stella, Flower of Spring, and Oak-leaved. To winter them properly they require a house or pit with means of applying fire heat in cold and dull moist weather, to keep out frost and expel damp. Wintering in cold frames is always attended with great risk of damping, the lights having very often to be kept closed on account of cold when the plants are damping off and require air. Some, however, are under the necessity of wintering them in cold frames, and we therefore advise you to choose the warmest, most sheltered spot you can find, and the site must be dry. Let the lights face the south, and slope well so as to throw off the wet rapidly, for when they are flat there is a danger of drip. Set the frame on bricks, having at least one course above the surrounding ground level, and leave between the bricks a space of about an inch. Fill coarse gravel or loose rubble to the level of the bricks, and then an inch or two of coarse ashes, and you can then surface with an inch of finer gravel for the pots to stand on. Place the plants in as small pots as can be done without reducing the roots to a very great extent, and set the pots on the ashes. If the soil be moist but not wet you will not need to water, but give air day and night when the temperature outside is above 35°. Early in December remove any leaves at all likely to damp, but not the fresh leaves and growing points, and with a sharp knife cut off any shoots or portions of shoots in which decay may have begun. This done, clear away every decayed leaf and return the plants to the frame, plunging the pots to the rims in dry cocoa-nut fibre refuse or coal ashes, with the finer particles sifted out. No water should be given however dry the soil. A dry fine day should be chosen for this preparation of the plants for the winter. Outside the frame, all round the sides and ends, place coal ashes, piling them up level with the under side of the light, or as high as you can without preventing the sashes being drawn off. In rainy weather tilt the lights at back, and whenever the weather is mild give air day and night. In frosty weather the lights will of course need to be kept on, and protecting material will often be necessary in addition, and it may remain on during the day when the temperature out of doors does not exceed 32°. In very severe weather you will need a covering of straw 6 inches thick in addition to a double thickness of mats. The straw should be dry and overhang the frame by 6 inches all round. This should only be resorted to in hard frost, and should remain on day as well as night as long as the temperature in the shade does not rise above 32°. On fine days exposure fully, give air in all mild weather, and pick off all decayed leaves.

COLEUS FOR BEDDING (Duncan McNeil).—The better kinds of Coleus are not suitable for the northern counties. The kinds most suitable are C. Verschaffelti, and Coleus Beauty of St. John's Wood. The latter is of free growth, and endures heat and cold well. To have good plants for planting out at the beginning of next June, and to give an effect at once, we put in the cuttings at this time singly in 3-inch pots, and strike them in a frame with a gentle heat. When struck remove them to shelves in a house having a temperature of not less than 45° in winter, keeping them dry and near the glass. In February we shift them into 6-inch pots, and in April into 9-inch pots, and commence hardening them off by the middle of May, by which time they will be fine plants, affording an effect at once. They are stopped in order that they may be of compact growth, and the tops, if inserted in a hotbed, will make small plants by June. However, in cold northern localities, the Coleuses are of little value, and unless planted out when strong and effective to begin with, they are best left alone, for small plants put out in the hope of becoming larger have but a small chance of doing so.

NAPOLITAN VIOLETS (Idem).—For blooming in winter these do not require bottom heat. Plant them in the frame early in October, after taking them up with balls. Light turfy loam with one-third leaf soil or well-decayed manure intermixed, will answer very well. The plants should be 6 inches from the glass, the distance from the soil to the glass being 9 or 10 inches. Russian Violets require the same soil. They cannot have too much air; but they should be protected from frost by mats or other covering in frosty weather.

REPLANTING TULIPS (Idem).—The bulbs having been left in the ground all summer, we should not advise their being taken up this autumn on the removal of the bedding plants. After lightly stirring the surface with a fork, give a top-dressing, about 1½ inch thick, of loam and leaf soil in equal parts. If you could have taken up your Tulips before they had made fresh roots, we would have advised replanting as soon as the ground had been manured and dug. The only advantage in taking them up would be in your being able to remove the offsets and small bulbs not likely to flower, and to enrich the soil. If they had begun to make fresh roots when taken up—the removal would be more injurious than beneficial.

BEST SEED (Idem).—The seed you have ripening from plants of last year's sowing will be equal to that you could purchase.

MARQUISE DE MORTMART (R. P.).—This is not a Rose of strong growth; indeed, few Roses of that shade of colour are. It is, however, well worth growing, and fine blooms have nice shell-shaped satiny petals. Weak blooms are certainly apt to be flat.

SUPERIOR HYBRID PEARL-FLOWER AND TEA ROSES OF THE LAST FOUR SAASONS (B. H. R.).—Of 1867.—Antoine Ducher, Black Prince, like Pierre Nottin; Horace Verneat and Annie Wood, both very good; Monsieur Noman and Princess Mary of Cambridge, two of the best pinks. Of 1868.—Boule de Neige, very good pillar Rose; Duke of Edinburgh, very fine colour; Christiane Nilsson, Elie Morel, François Fontaine, Madame la Baronne de Rothschild, one of the greatest acquisitions of late years; Pitord, Reine du Midi. Of 1869.—Erthe Baron, Emilie Hausburg, Julie Tonvais, Henri Ledechaux, Dupuy Janio, Desvieux Lamy, Monsieur Creyton, Marquise de Mortmart, Nardy Freres, Thyra Hammerich, and Victor le Bihan. Of 1870.—It has been a trying season to test this year's Roses. Candide, Charles Trauer, Comtesse d'Oxford, Ferdinand de Lesseps, Jules Scurie, Louis Van Houtte, Mdlle. Eugénie Verdier, Marquise de Castellane, Paul Neron, Reine des Beautés, and Thomas Methven. Teas of 1867, 1868, 1869, and 1870.—Madame Margottin, Clotilde, Reine du Portugal, Marie Sisley, Marie Ducher, Montplaisier, Belle Lyonnaise, and Catherine Mernot.

PEACHES (Y. W. Popham).—There is no such Peach as Dymond. Probably it is Diamond, a seedling raised by Mr. Veitch, of Exeter, some years ago. Since the rain my splendid crop of Peaches and Nectarines is swelling beautifully. (H.).—Mr. Staudish's Early Ascot is beautiful and excellent. It ripens soon after the Early York, which is still one of the best early Peaches. Early Victoria is much like it, but larger and very delicious. Early Alfred is also an early Peach of great beauty and excellence, and an excellent cropper. Lord Palmerston is a very large and fine Peach, not yet tasted. Too much praise cannot be given to Princess of Wales as a very large late Peach. In season here from the 24th to the end of September. It forms a good succession to Barrington, one of our best late Peaches. It has a creamy cheek with delicate pink suffusion. My trees are in famous triple bud, and the wood is hard and nearly ripe. In the Rose "Glimpses," page 144, read Blanche "Meru," and not "Meon."—W. F. RADCLIFFE.

DISEASED PEAR LEAVES (R. S. T.).—They are suffering from the parasitic fungus *Roestelia cancellata*. There is no remedy now, for picking off the leaves and burning them would be of no use, as the spores are shed. When the leaves fall collect them, pile off an inch depth of the soil around the tree, and burn all together. Paint the stem and branches with a mixture of clay and sulphur, look out next year for the first reappearance of the fungus, and pick off the leaves as fast as it appears upon them.

TERRA-COTTA GAS STOVES (Harcoll).—We have not seen the terra-cotta stoves of Mr. Bennet in use, heated by gas. We have no doubt that with the dish beneath supplied with water, the flame of gas regulated, and especially if argand burners are used, that there will be so little escape of gas, that the stove would do admirably for halls, corridors, &c., where plenty of air was admitted. We are informed that with argand burners, under such circumstances, there is no escape and no smell. For ourselves, if using the stove for plants, we would prefer a small pipe, even if less than a quarter of an inch in diameter, to go from the top of the stove into the open air. For your place a 4-shilling stove would do, but as it is always desirable to have enough of heat, the largest might be desirable. We are well aware that the heat will be more genial than from iron stoves. The water below is also an advantage.

WATERING VINES IN A CONSERVATORY BORDER (A. A.).—Water delivered from pressure, and if cold, is often not beneficial. We think if you examine the Vine roots you will find them overdry. Why not have a latticed path over the roots instead of the gravel path inside? Gravel is very deceiving in this respect, and you cannot easily water sufficiently without breaking it up. Watering the floor in your case will be safer than syringing the Vines.

FLOWER-GARDEN BORDER PLANTING (Kibbie).—You will find an answer to your inquiries at page 151. For such a narrow border three lines would be more effective than any composition. What you have will do very well if you can keep the *Tropaeolum* right by picking. We would greatly prefer a row of Scarlet Geraniums instead, and if cuttings are inserted now, as stated in "Doings of the Last Week" a fortnight ago, it would take little room in winter to hold about three hundred. Something like Tom Thunb, Little David, or Brilliant would be best, as not too high for *Calceolarias* at the back, and the variegated *Alyssum* in front, next the Ivy.

TRAINING MINIATURE APPLE AND PEAR TREES (Amateur).—We cannot advise you as to training your young grafted fruit trees as bushes or as pyramids, as both are good, and both have their advantages. You can have more plants as pyramids, but, on the other hand, the bushes fill the places best, instead of leaving room between, as with pyramids. In either case you must cut your own shoot, so as to secure a base, but perhaps it would be as well to defer that until the spring, as shoots made after cutting or stopping now would not be ripened. If resolved on pyramids, after forming a base, you must keep one leader instead of a number. On the whole we think the bush plan the more profitable.

SHADING POINSETTIA PULCHERRIMA AFTER POTTING (J. B.).—*Poinsettia pulcherrima* when fresh potted will be the better of a little shade. Afterwards, and especially in autumn, the plants can scarcely have too much sun light to ripen the terminal buds.

GIVING LIQUID MANURE TO STRAWBERRIES (Idem).—We give no manure water to fresh-potted Strawberry plants until the roots begin to touch the sides of the pots. Your pots must be large and the plants very fine if from a thousand pots forced you can gather a ton of fruit; that would be nearly 2½ lbs. from a pot.

GOLDEN, SILVER, AND HARESFOOT FERNS (A. Z.).—There are neither golden nor silver Haresfoot Ferns, but if you mean different species, then of *Gymnogrammas* there are the common golden and silver, but no species of them thrives in a greenhouse. There is a golden *Adiantum* (A. sulphureum), and also a silver one (A. scabrum), both of which succeed admirably in a greenhouse. The genus known popularly as Haresfoot Ferns is *Davallia*, of which *D. canariense*, *D. pyxidata*, *D. Lindleyi*, and *D. solida* will thrive in a greenhouse, the first named being the commonest species.

POTATOES (L. J. H.).—In the Borough and Farringdon Markets they are

especially sold in wholesale quantities by weight. The great railway Potato market is at King's Cross.

STRAWBERRIES LOSING THEIR COLOUR (*E. C., Oakham*).—We cannot tell how the Strawberries, after being planted two or three years, lose their colour—become whitish, though well flavoured. Probably in your shaly soil a good annual dressing of rich manure and a little soot would prevent it. If not, you must plant offener. The varieties we prefer are British Queen, Empress Eugénie, Dr. Hogg, and Keens' Seeding; but tastes differ, and so do varieties in different soils and climates.

BURNING SULPHUR IN A VINERY (*Dilemma*).—We cannot understand how anyone having a knowledge of plants could venture even to "burn a pinch of sulphur" in a vinery. The sulphurous acid formed by such burning is death to any part of a leaf that inhales it. The Vines, the leaves of which you have thus injured, will have their present crop deteriorated, and next year's crop lessened probably. Keep the air of the vinery moist, and do not remove any leaf that has a particle of green surface left; such leaves and new ones which will be formed probably may mature the crop.

ATLANTHUS GLANDULOSA (*F. D.*).—It is now very common. If you state what you wish to exchange, and what you require in return, we will insert your wishes in the exchange column if you enclose twelve postage stamps.

NAMES OF FRUITS (*A. M. F.*).—*Plums*.—1, Orleans; 2, Lucombe's Non-such; 3, Golliath; 4, No wood sent. *Apples*.—2, Margil; 3, Non-such. *Pears*.—1, Williams' Bon Chrétien; 2, Gansel's Bergamot; 3, Nouveau Poiteau; 4, Passe Colmar; 5, Striped Virgoulenise. Many of the Pears are too immature.

POULTRY, BEE, AND PIGEON CHRONICLE.

A TRIP INTO GLOUCESTERSHIRE AFTER POULTRY.—No. 2.

As I began to enter Stroud, it was easy to be seen that its inhabitants had determined to make their picturesquely situated town as gay-looking as possible. There was such a display of hunting that I began to think whether *that* was not its staple manufacture, until a motto over an arch recalled to my mind the truth, for its words were, "Success to our staple trade, superfine cloth." There were flags everywhere, and wreaths of evergreens, and garlands and festoons, which all told of the long and successful labour of many hands. Thankful am I to say that we were spared the almost inevitable fir trees in the streets, the only benefit of which is, that they are decorations which cost no trouble, while, on the contrary, the good Stroud people evidently had spared themselves no trouble. I rode under numerous arches, reading and commenting upon their various mottos—mottos religious and secular, mottos agricultural and commercial, and I said back what one said to me, "Happy to see you." A motto over a very telling arch, but somewhat hidden by its surroundings, puzzled me awhile. At first I read it as, "Success to the Gas," but could not conclude that gas was a recent introduction in the go-a-head borough of Stroud. Then I read it "Success to the Gals," and I thought, however right the feeling expressed, yet Stroud men might have been more gallant, and should have written "Success to the Ladies." I then noticed a little comma, and the puzzling word was no word at all, but "G. A. S.," which I presume meant "Gloucestershire Agricultural Society." Right through the town we go, and I always notice that in prosperous towns the respectable outlying part, the verge, the fringe so to speak, whatever be the scenery, is very pleasing to an eye that loves the subjects dilated on in "our Journal," for it is in this part that the inhabitants build villas, and make their homes beautiful with tree, shrub, and flower; and on the bright paths or green grass, or swinging on the gates, I see pretty little children with bright blue eyes, and bright locks, some very "golden fleeces," blowing in the breeze, their fathers so many happy Jasons, and cheeks, as on this day, a-glow with excitement, and eyes watching with delight the holiday-makers as they drive past. Truly there is no prettier sight in the world than a well-built, well-gardened English villa. A mansion often looks cold and desolate, a palace not unfrequently looks gloomy though grand, but an English villa looks a bright, happy, liveable place.

Having driven past several such villas, we reach Stratford Park, where the Show is held. "Bath and West of England, but smaller," is my exclamation as I enter. The Gloucestershire Agricultural Society held its first show in 1858, that was at Gloucester. Since 1862 it has been peripatetic, and now for the first time wandered to Stroud, and, I am told, is larger than it ever was before. There is also this year another improvement, particularly interesting to us of this Journal—a Poultry and Pigeon Show has been added. I understand that this decision was arrived at very late, but energy brought success.

There was energy and liberality in the Committee, for they gave a silver cup, and seven other cups came from various liberal persons or classes. Thus from all I saw and heard at Stroud, there seems to have been but one spirit pervading its worthy inhabitants and their neighbours, that of putting their shoulders to the wheel, and doing all they could, and doing it for the most part well.

The placards, "To the Show-yard," contained a pleasing deception, for instead of a yard, it was a goodly portion of a goodly park, and the shelter of its elms was as welcome as the trees were ornamental; among which, indeed, the white tents, large, middle-sized, and small, glistened in their whiteness. There was a long row of horse-boxes—extempore stables, and the horse-ring with the keen-eyed judges in the centre, and there were implements of course, though not many, and cattle and sheep, and unsavoury pigs, to become savoury after death.

I watched the horse-ring until a poultry catalogue was to be had, and then entered the tents, whose inhabitants crowded, cackled, and cooed. The Dorkings, as was their due at an agricultural show—for they are the farmer's and cook's fowls—stood first, and formed a very good class, a considerable number of pens being occupied by prizetaking birds, so that a loser of a prize here was not necessarily a bad pen; indeed the Dorkings were good, excellent, and most excellent. Dark Brahmas next, followed by their Light brethren. The first prize in the latter class went actually to chickens! The Cochins were good. The Spanish class was both large and good, and the cup pen in most excellent feather. Of the Game, the Duck-wings were a better class than the Black Reds. The Hamburgs were jumbled together; this a mistake. Polish were fairly numerous, and the "Any variety class" showed a very good pen of Black Hamburgs. Of the Game Bantams, I can only, as a true chronicler, say of them as a friend of mine said to a discharged servant upon her asking whether he could give her a character. He replied, "Oh! yes, I can give you a character, certainly, but not a character that will do you any good." The single cock class contained, besides the prize birds, an excellent Dorking cockerel belonging to the Rev. A. K. Cernwall, which extorted praise, but was, strangely enough, not even commended. Among the quacking, hissing, gobble, gobble birds, a curious circumstance occurred. Mr. Fowler's pen of Geese won the blue riband of the Show by "a fluke"—viz., the Stroud Licensed Victuallers' silver cup for the best pen of poultry in the Show. The Committee added a proviso that the same pen should not be eligible to take two cups. Mr. Fowler must indeed have been surprised, and I hope he will drink the health of his beautiful pen, and spare them from ever being eaten, they having won silver.

And now I come to the Pigeons. The Carriers were most excellent and numerous; Pouters few but good; and Mr. Fulton's Blues, which took the cup, were very good. The Tumblers, too, were good, as we should infer from the names of their exhibitors. Of the Runts I was pleased to see as many as five pairs. Fantails followed, and then a large and pretty "Any other variety class;" but among them I noticed only one pair of Nuns, those old and strikingly pretty Toys.

But home I must drive; so taking a loving stroll through the flower tents, and sitting listening to the Fusiliers' band, whose music made me forget time's flight, but kept me in a pleasing, dreamy, lotus-eater condition, while the groups of fair ladies, mothers and daughters, passed before my eyes like figures in a vision, at length I drew myself reluctantly away at the very most enjoyable time, the cool evening hour. Not soon shall I forget Stroud Show and the beautiful scenery around it. Of course there were a few amusing incidents, there always are at all shows. Thus there was the red-faced man who declared his pen of Ducks was the best in England, in truth it was the worst in the show. Then there was the non-poultry friend gently chaffing his poultry friend by saying, "Is it true that you send your fowls to the shows simply to save three days' keep?" I trust that a poultry show will always be attached to "G. A. S.," and be as good a one as this was at Stroud. Back we went through the same lovely scenery until darkness dropped its curtain around us, and I sat and thought all over, and tried to fix the beauty of all on my recollection.—WILTSHIRE RECTOR.

ROOSTING-PLACE FOR CHICKENS.

We begin now to perceive the approach of mid-autumn, and winter treads on its heels. Hitherto we have allowed our chickens to roost where they would, but it is time to think of

their being safely housed during the long nights. We are often told, and we believe it, that they never do so well as when they choose their own roosting-places; but we have to recollect that with the long nights come sharp morning frosts, cutting winds, and driving rains and sleet. These are very hurtful to fowls of all ages. A labouring man once said to us, "A good fire is half a bellyfull," and we believe him. In our country labourers buru turf, and when a man comes home from his work, damp, hungry, and tired, and the goodwife throws on a couple of large turves, stirs in the ashes, blows into them with the bellows till the dead heather on the turves ignites, and the flame roars and crackles up the chimney, lighting the house, and, through the windows, yards out into the road, though the meal be but potatoes, there is a sense of comfort that is to a certain extent satisfying. Compare the meal with one even of a better quality eaten standing in a ditch with your back against the bank to be screened from the rain and wind. It is the same with chickens in all respects but one. The man will choose the best lodging he can, the chickens will most obstinately stick to the first roosting-place, which is now getting positively injurious to them. They will hold to it just as a covey of Partridges cling to the stubble where they were bred in the corn, until no vestige of it remains. "Ah!" says one, "bring up your chickens like Partridges, they roost where they like." We are quite sure we rear more chickens in our artificial way, than Partridges, Pheasants, and Grouse do in following nature. Many of those who start with high expectations to-day will be able to tell us how, through the drought, covies have disappeared, that the wonderful promise of the third week in June has been badly kept, that pairs of old birds have been found where eighteens were expected, that want of water and scorching sun have done their work to the destruction of the breed in many places. The same would happen with our chickens if we allowed them to choose roosting-places for themselves, and as it is too late to do so after they have colds and incipient roup, they would soon follow the natural Partridges; and now cub-hunting begins, the litters are scattered and driven into fresh districts, and they soon find the roosters in the hedges or trees. But in many places the chickens roost in the rips after the hens have left them; in such a case the rips should be moved every day nearer to the house they are intended to occupy, till at last they are brought into it. The rips should then be taken away, and for some nights the chickens must be driven into the house; they will not take to it willingly. To do this now will save trouble and death hereafter.

There are many complaints about the inconvenience of numbers of young cocks now arriving at a troublesome age. We have for years made a pen about 20 feet by 12, with a warm brick and slated roosting-place, and we keep therein from fifteen to twenty cocks. They grow up there and do better than they would running about. They do not fight, and they give no trouble.

BONE DUST FOR CHICKENS.

In reply to those who desire a few further particulars regarding the use of this substance for rearing large birds, I desire to add the following:—I only recommend it for the large breeds, and my experience of it does not extend farther. For them it is certainly not injurious. I cannot conceive that it would be so for delicate varieties; for small fowls it is useless, except to give to adults during moulting time. In this way it is most valuable, supplying just the material wanted for the formation of new feathers. It must not be confounded with raw or new bones crushed, the effects being altogether different. Were raw bones given constantly the effect would be injurious and unhealthy stimulation and hastening of maturity; hence, these cannot be given regularly to pullets as they approach the laying age, though valuable in moderation for cockerels and adult fowls. The dry bone dust, on the contrary, retards maturity, keeping back laying, and maintaining the raw or leggy appearance, during which the birds grow. To have this effect, I repeat it ought to be given constantly in every feed of soft food, adding about a good heaped-up teaspoonful to every half-pint of meal.

The bone dust is not always precisely the same, and is not always easy to procure at all. Sometimes it is very dark-coloured, and has an offensive foetid smell, but is not injurious on this account, except that if given to laying fowls the eggs will taste "musty." Sometimes it is almost in fine powder, at others—and I like this best myself—it more resembles coarse meal. In this case the coarser splinters need not be

separated, as the birds will reject all too large for them. Some I got this season was the best I have had for some time, being nearly white and almost free from smell. I have also heard that bone sawdust, as obtained from workers in bone, has been found very good.

Finally, I never recommended this substance as a necessity for rearing fine birds. Hundreds of splendid fowls have been reared without it, and, probably, people with good runs and skilled feeders do not need it. But all my poultry-keeping is carried on under a host of difficulties. My largest pen or run is only 20 feet square, and all the others much less. Of grass, I have not, of course, a blade in my whole yard. How I manage under such circumstances I may, perhaps, say some other time; but my present point is this, that in such confined spaces I find a marked difference in the size of pullets, especially since I used the bone meal. I used to think 1 lbs. a good weight for a Brahma pullet four months old; now I can generally get 5 lbs. Further, I have letters since I first recommended it in my work on Brahmas, from some of our best-known exhibitors, stating similar effects in their experience, and I am convinced that to all who only have such small pens as poor "Nemo," the ingredient will be a real boon.—L. WRIGHT.

THE CRYSTAL PALACE POULTRY SHOW.

MAY I ask if it is the intention to repeat this year the Show held at the Crystal Palace? If so, is it not quite time the date were announced, that it may not clash with other exhibitions, as is likely to be the case if left until the last moment? The Birmingham and Bristol authorities have for some time past fixed their dates, and if the Committee of the Crystal Palace follow their example, it will probably prevent two or more important shows being held at the same time. I am sure many of your readers will be glad to know that the only exhibition in the vicinity of the metropolis will not be discontinued, and the large number of visitors at the last show gave ample proof of the interest taken in it by the public. Perhaps the late President or Secretary will oblige by stating if any steps are intended to be taken to repeat the show, or if, so far as they and the late Committee are concerned, it is decided to let the matter drop.—COLUMBA.

CLEAN-LEGGED WHITE BANTAMS.

We have had East Indian Ducks, Brown Red Game Bantams, and other varieties noticed as being much neglected, and deserving of encouragement from poultry committees. Being an admirer and breeder of White Bantams, I wish to introduce them to the notice of committees and others interested in them as being a variety nearly lost sight of; and if something be not done, and some encouragement held out for them, we shall soon lose sight of them in the show pen altogether. They have mostly to compete (with few exceptions) against the Black, Laced, and foreign varieties, and in most cases the prizes fall to Blacks. Being a breeder and exhibitor of Blacks, I have shown them successfully, at the same time I have to keep my White Bantams at home, knowing that Black would be preferred by the judges. Still I do not know why it ought to be so, for I consider White Bantams hardier, better layers, and better mothers; and what can look more beautiful than a clean satiny White Bantam? Being an old-established breed, I think it the duty of every White Bantam fancier to do his best for them. Out of twenty-three entries of Bantams "Any other variety, except Game," at Rochdale last week, there was not a single White clean-legged Bantam. I should be glad to hear the opinion of other fanciers; but I hope ere long we shall have at every show a separate class for Black Bantams, to which their numbers entitle them, and it would give a better chance of success for the poor, despised, and neglected—WHITE BANTAM.

WORSLEY AND SWINTON POULTRY SHOW.

THIS was held on August 25th in the Park at Worsley. The following awards were made by the Judges, Mr. R. Teebay, and Mr. John Douglas:—

DOBKINGS.—1 and 2, J. Stott, Healey, Rochdale. SPANISH.—1, C. W. Brierley, Middleton. 2, W. Parr. PATRIGOLD. COCHIN-CHINA.—Buff.—1, 2, and Cup, W. A. Taylor, Manchester. Partridge of any other colour.—1, W. A. Taylor. BRAHMA FOOTBALLS.—1 and 2, W. A. Taylor. *de. E. Leech, Rochdale. GAME.—Cock.*—1 and 2, C. W. Brierley. *Black or Brown Red.*—1 and 2, J. Carlisle. Early. 2, C. W. Brierley. *Any Colour.*—1, C. W. Brierley. 2, J. Mitchell, Moseley, Birmingham. HAMBROONS.—Golden-pencilled.—1, T. Wrigley, jun., Tonge Hall, Middleton. 2, W. Parr. *Silver-pencilled.*—1 and 2, W. Parr.

Golden-spangled.—1 and 2, F. Brierley, Heywood. Silver-spangled.—1 and 2, W. Farr. Bantams.—Game.—1, T. Gregory, Little Hulton. 2, L. Binney, Manchester. Any Variety.—1, S. & R. Ashton, Roe Cross, Mottram. 2, T. Stone, Worsley. ANY BREED.—1, P. Unsworth, Lewton, Newton-le-Willows. 2, L. Binney (Houldens). GOSLINGS.—1, E. Leech. 2, S. H. Stott, Rochdale (Toulouse). DUCKS.—Aylesbury.—1, E. Leech. 2, W. Parr. Rouen.—1, J. Scottoun, Little Bymon, Lewton. 2, T. Wakefield, Golborne, Newton-le-Willows. TURKEYS.—1, E. Leech. 2, W. Whitte, Worsley.

PIGEONS.

CARRIERS.—1 and 2, E. Horner, Harewood. FOUTERS.—1 and 2, E. Horner. TRUMPETERS.—Short-faced.—1, E. Horner. 2, J. Fielding, jun., Rochdale. Common.—1, E. Horner. BARBS.—1 and 2, Capt. H. Heaton, Worsley. *he*, J. Fielding, jun.; Capt. H. Heaton. OWLS.—1 and 2, J. Fielding, jun. *he*, G. A. Thom, Pendleton. JACOBS.—1 and 2, E. Horner. TERBITS.—1 and 2, J. Fielding, jun. *he*, H. Yardley, Birmingham. FANTAILS.—1, H. Yardley. 2, E. Horner. TRUMPETERS.—1, E. Horner. 2, P. Unsworth. DRAGONS.—1, P. Unsworth. 2, H. Midgley, Swinton. ANY OTHER VARIETY.—1, J. Fielding. 2, E. Horner.

WHITWORTH AND ROCHDALE POULTRY SHOW.

The following awards were made at this Show, held on the 24th ult.:

SPANISH.—Cock.—1, F. & C. Haworth, Newfield, Haslingden. 2, H. Beldon, Goitstock. *c*, F. & C. Haworth; T. C. & E. Newbitt, Epsworth. Hens.—1, F. & C. Haworth. 2, J. Brown, Putney Heath. Cockerel.—1, C. W. Brierley, Middleton. 2, E. Horner, Sheffield. Pullets.—1, H. Brown, Surrey. 2, E. Brown. *c*, C. W. Brierley.

COCHINS.—Cinnamon and Buff.—Cock.—1 and 2, W. A. Taylor, Manchester. Hens.—1 and 2, W. A. Taylor. 2, C. W. Brierley. Cockerel.—1, W. P. Rylands, Edington. *he*, C. Sidgwick, Kingleigh. *c*, J. Watts, Kings Heath, Birmingham. W. A. Taylor. Pullets.—1, C. Sidgwick. 2, W. A. Taylor. *he*, J. Stretch, Ormskirk; W. A. Taylor; C. Sidgwick. Any other Variety.—Cock.—1 and 2, W. A. Taylor. Hens.—1 and 2, W. A. Taylor. Cockerel.—1, W. A. Taylor. 2, C. Sidgwick. *he*, J. H. Dawes, Birmingham. Pullets.—1, W. A. Taylor. 2, C. Sidgwick. *he*, T. Stretch.

BRAHMAS.—Dark.—Cock.—1, J. H. Pickles, Birkdale, Southport. 2, H. Dowsett, Hoxley. Hens.—1 and 2, J. H. Pickles. Cockerel.—1, Mrs. Burrell, Ipswich. 2, W. A. Taylor. *he*, C. Lyland, Warrington. W. A. Taylor. Pullets.—1, Mrs. Burrell. 2, W. A. Taylor. Light.—Cock.—1, F. Crook, Forest Hill. 2, J. Pares, Postford, near Guildford. Hens.—1, H. Dowsett. 2, F. Crook. Cockerel.—1, H. Dowsett. 2, J. Watts. Pullets.—1, T. Matthew, Hurstend, Rochdale. 2, M. Lemo, Markate Street, Dunstable.

GAME.—Black or Brown Red.—Cock.—Cup, T. Statter, jun., Whitefield, Manchester. 2, C. W. Brierley, W. Boyes, Beverley, Yorkshire; C. W. Brierley; C. Chaloner. *he*, C. Chaloner. Hens.—1, W. Brierley. 2, C. Chaloner. *he*, W. Boyes; T. C. & E. Newbitt. Cockerel.—1, C. Chaloner. 2, C. Chaloner, jun. *he*, C. Chaloner. Pullets.—1, J. F. M. Fitton, Humblefield, Halifax. 2, G. and Sutcliffe, Queensbury. *he*, Stott & Booth, Hantley Brook, Bury; C. W. Brierley; C. Chaloner. Any other Variety.—Cock.—1, C. Chaloner. 2 and *he*, W. Boyes. Hens.—1, C. Chaloner. 2, C. W. Brierley. Cockerel.—1, C. Chaloner. 2, J. F. M. Fitton. Pullets.—1, C. Chaloner. 2, J. F. M. Fitton (Duckwing). *he*, C. W. Brierley.

BOULARDS.—1 and 2, H. Beldon. Hens.—1 and 2, H. Beldon. Cockerels.—1, H. Beldon. 2, H. Pickles, jun. Pullets.—1 and 2, H. Pickles, jun. *he*, H. Beldon.

HAMINGAS.—Golden spangled.—Cock.—1 and 2, H. Pickles, jun. *he*, Miss C. E. Fulmer, Lighthorne, Warwick. Hens.—1, H. Beldon. 2, J. Buckley, Taunton, Ashton-under-Lyne. *he*, T. Walker, jun., Denton. Cockerel.—1 and 2, J. Buckley. *he*, T. Walker, jun.; J. Andrew, Waterhouses, Ashton-under-Lyne. Pullets.—1, T. Schales, Hollingwood. 2, T. Walker, jun. *he*, T. Walker, jun.; J. Chadderton, Hollingwood. 2, Brierley, Heywood. Silver-spangled.—Cock.—1, J. Fielding, Newchurch. 2 and *he*, H. Beldon. Hens.—1, H. Beldon. 2, H. Beldon. *he*, J. Fielding, Newchurch, near Manchester. Cockerel.—1, J. Fielding. 2, H. Pickles. *he*, G. & J. Duckworth, Blackpool. *c*, J. H. Howe, Ashton & Booth, Broadbottom, Mottram. Pullets.—1, J. Fielding. 2, Ashton and Booth. *he*, H. Beldon. Golden-pencilled.—Cock.—1, H. Pickles. 2, H. Beldon. Hens.—1, H. Beldon. 2, H. Pickles. Cockerel.—1, T. Wrigley, jun., Tonge. 2, S. Smith, Bhowman, Halifax. *he*, H. Beldon; H. Pickles. Pullets.—1 and *he*, T. Wrigley, jun.; S. Smith. Silver-grey.—Cock.—1, H. Pickles. 2, H. Beldon. Hens.—1, H. Beldon. 2, H. Pickles. Cockerel.—1, H. Beldon. 2 and *he*, H. Pickles. Pullets.—1 and *he*, H. Pickles. 2, H. Beldon. Black.—Cock.—1, H. Beldon. 2, T. Walker. *he*, C. W. Brierley. Hens.—1, T. Walker. 2, H. Beldon. *he*, H. W. Hingworth. Pullets.—1 and 2, C. Sidgwick. *c*, W. Collyer.

DORINGS.—Cock.—1, S. H. Stott. 2, T. Statter, jun. Hens.—1, J. Stott. 2, J. Watts. Cockerel.—1 and 2, J. Stott. Pullets.—Cup, T. E. Kell, Weltherby. 2, J. White, Warley.

FRENCH FOWLS.—Cock.—1, H. Beldon, Goitstock. 2, C. Morris, Hohnleigh Crossdale. Hens.—1, H. Beldon. 2, W. O. Quibell, Newark. Cockerel.—1, W. O. Quibell. 2, W. Gamon, Chester. *he*, Mrs. M. Seamons, Hartwell, Aylesbury (Creve-Coeur). Pullets.—1, W. O. Quibell. 2, Mrs. M. Seamons (Creve-Coeur). *he*, Mrs. E. Williams, Henlys, Berrier (Creve-Coeur). ANY OTHER VARIETY EXCEPT BANTAMS.—Cock.—1, Mrs. Burrell. 2, Messrs. Kitchen & Co., Farnscole, Blackburn. Hens.—1, Mrs. Burrell. Cockerel.—1, J. Hinton, Warminster (Malay). 2, Mrs. M. Seamons (Silky). Pullets.—1, J. Hinton (Malay). 2, Mrs. M. Seamons (Silky).

GAME BANTAMS.—Black or Brown Red.—Cock.—1, J. Crosland, Wakefield. 2, W. F. Entwistle, Cleckheaton (Black-breasted Red). Hens.—1 and 2, J. W. Morris. Any other Variety.—Cock.—1, T. Dymson, Halifax. 2, W. F. Entwistle. Hens.—1, T. Barker, Hartley. 2, W. F. Entwistle. Any other Variety except Game.—Cock.—1, H. Beldon. 2, A. Stott, Rochdale. Hens.—1, J. Walker, Halifax. 2, M. Lemo.

DUCKS.—Aylesbury.—Drake.—Cup, E. Leech. 2, J. K. Fowler. *he*, Mrs. M. Seamons. Ducks.—1, E. Leech. 2, Mrs. M. Seamons. *he*, Mrs. M. Seamons; J. K. Fowler. Rouen.—Drake.—1, T. Statter, jun., Stand Hill, Whitefield, Manchester. 2, W. F. Stott, Rochdale. *he*, E. Leech; S. H. Stott; H. B. Smith, Broughton, Preston. Ducks.—1, E. Leech. 2, T. Statter, jun. Drake and Duck.—1, C. W. Brierley. 2, H. B. Smith. *he*, R. Ashton; T. Statter, jun. GREENS.—White.—Cocker.—1 and 2, E. Leech. *he*, T. Statter, jun. *he*, E. Leech. 1 and 2, E. Leech. *he*, Mrs. M. Seamons. *c*, T. Statter. Goslings.—Cup, E. Leech. 2, Mrs. M. Seamons. *he*, E. Leech; G. Husler, Stillmicklet, York. Grey.—Gander.—1, J. K. Fowler. 2, E. Leech. *he*, Mrs. M. Seamons; T. Statter, jun. *c*, J. White, Whiteley, Netherton, near Wakefield. Geese.—1, G. Husler. 2, E. Leech. Goslings.—1, E. Leech. 2, Mrs. M. Seamons. *he*, J. K. Fowler.

TURKEYS.—Cock.—1 and 2, E. Leech. *c*, H. Crossley, Halifax. Hens.—Cup, E. Leech. 2, F. E. Richardson, Bramshall, Uttoxeter. *c*, H. Crossley. Poults.—1 and 2, E. Leech.

SELLING CLASS.—Cock.—1, C. W. Brierley. 2, J. Watts. *c*, E. Leech. Hens.—1, Barch & Boulter, Sheffield. 2, H. Brown. *he*, F. & C. Howarth; H. Beldon. H. Dowsett. *c*, W. A. Taylor.

COTTAGERS' CLASSES.—GAME.—Cock.—1, P. Leech, Rochdale. 2, A. Milnes, Rochdale. Hens.—1, J. Whitehead, Littleborough, Rochdale. 2, A. Milnes. 2, P. Leech. COCHINS.—1, W. Trevor, Rochdale. 2, J. Pickup, Rochdale. SPANISH.—1, J. Pickup. 2, S. Hill, Whitworth. BRAHMA.—1 and 2, W. Trevor. HAMBUCKS.—Pencilled.—1, J. T. & J. Stott, Warley. 2, J. Law, Rochdale.

Spangled.—1, J. Greenwood, Rochdale. 2, S. Wrigley, Broadhaugh. Black.—1, J. Law. 2, J. & B. Rizer, Rochdale. ANY OTHER VARIETY.—1 and 2, J. Butterworth, Whitworth, Rochdale. BANTAMS.—1 and 2, A. Milnes. Game.—1, T. Lively, Rochdale. 2, J. Butterworth. Goslings.—1, J. Butterworth. 2, T. C. Walker, Spalden. DUCKS.—White.—1, J. Buckley, Rochdale. 2, J. W. Simpson, Greave, Rochdale. Any other Colour.—1, G. Healey, Two Bridges, Rochdale. 2, W. Lamb. TURKEYS.—1, T. Spawford.

PIGEONS.

PORTERS.—Red or Yellow.—Cock.—1, 2, and 3, R. Falton, Deptford. *he*, J. Hawley, Bingley (Red. 2); E. Horner, Harewood. Hens.—1 and 2, R. Falton. 3, E. Horner. Any other Colour.—Cock.—1, E. Horner. 2, R. Falton. 3, J. H. Harvey, Sheffield. *he*, S. Robson, Brotherton, Ferry-bridge; R. Falton. Hens.—1, E. Horner. 2 and 3, E. Falten. *he*, R. Falton. 3, J. H. Harvey.

CARRIERS.—Black.—Cock.—1, J. W. Wiltshire, West Gorton. 2, R. Falton. 3, E. Horner. *he*, H. Yardley, Birmingham; E. Horner (2). J. Ord, London (2); R. Falton. Hens.—1, 2, and 3, R. Falton. *he*, H. Yardley; E. Horner; J. C. Ord (2). Any other Colour.—Cock.—1, F. Wiltshire, West Gorton. Equal 1, R. Falton. 2, E. Horner. *he*, B. Consterdine, Littleborough, Rochdale; J. C. Ord; R. Falton. Hens.—1 and 2, R. Falton. 3, E. Horner. *he*, J. C. Ord.

TRUMPETERS.—Almost.—1, J. Fielding, jun., Rochdale. 2, F. W. Wiltshire. 3, E. Horner. *he*, F. W. Wiltshire; J. Ford, Monkwell Street, London, E.C. 2; R. Falton (2); J. H. Harvey. *c*, F. Kov, Beverley. Falde or Beard.—1 and 2, J. Fielding, jun. 3, R. Falton. Any other Variety.—1, R. Minnett, jun., Healey, Rochdale. 2, J. Hawley. 3 and *he*, R. Falton.

OWLS.—Foreign.—1 and *he*, J. Fielding. 2, R. Falton. 3, P. H. Jones, Fulham. English.—1, J. Hawley (Blue). 2, J. Thresh, Bradford. 3, E. Horner. *he*, A. Jackson, Heaton, Bolton-to-Moor.

BARBS.—Black.—1 and 2, Capt. Heaton, Worsley, Manchester. 3, F. Fifth, jun., Dewsbury. *he*, E. Horner. R. Falton (2). *c*, E. Horner. Any other Colour.—1, Capt. Heaton. 2, J. Fielding. 3, A. Maignall, Lower Proughton.

TURBITS.—Red or Yellow.—1, J. Fielding, jun. 2, E. Horner. 3, H. Yardley. Any other Colour.—1, J. Fielding, jun. 2, H. Yardley. 3, T. C. & E. Newbitt, Epsworth. *he*, J. Hawley. *c*, E. Horner.

NUSS.—1, H. Yardley. 2, Miss R. C. Frow, Kirkcaldy.

JACOBS.—Yellow.—1 and 2, E. Horner. 3, R. Falton. *he*, T. C. & E. Newbitt. Any other Colour.—1, E. Horner. 2, E. E. M. Royle, Greenhill, Rochdale. 3, B. Van Haansbergen, Newcastle-upon-Tyne. *he*, T. C. & E. Newbitt.

ANTWERPS.—Medal.—E. Horner. 2, W. A. Taylor. 3, J. Crosland, Wakefield. FANTAILS.—1, E. Horner. 2, T. C. & E. Newbitt. 3 and *he*, J. Bailey & Sons, Mount Street, Grosvenor Square, London.

DRAGONS.—Blue.—1 and 2, H. Yardley. 3, E. Horner. *he*, W. Gamon, Chester. Any other Colour.—1, J. C. Ord. 2, H. Yardley. 3, A. W. Wren, Lowestoft. *he*, J. Watts; R. Falton; C. Bulpin.

TACONETS.—1, E. Horner. 2, W. B. Van Haansbergen. 3, J. Hawley. *he*, S. Robson; J. Fifth, jun.; A. Ashton, York.

MAGPIES.—1, F. Horner. 2, T. C. & E. Newbitt. 3, W. Kitchen. ANY OTHER VARIETY.—1, E. Horner. 2 and 3, J. Bailey & Sons. *he*, H. Yardley.

SELLING CLASS.—1, C. Abton, York. 2, F. W. Zurborst, Dublin. 3, E. Horner. *he*, F. Key; J. Fifth, jun.; T. Statter. Half; J. Watts; J. H. Harvey, Sheffield; J. Kershaw, Rochdale (2).

RABBITS.—Lop-eared.—1, A. H. Easton, Hull. 2, E. Vaughan, Birmingham. *he*, G. Johnson, Kettering (2). Silver-grey.—1, E. E. M. Royle, 3, S. G. Hudson, 2, S. G. Hudson (Dutch). Selling Class.—1, E. E. M. Royle. 2, G. Johnson.

JUDGES.—Poultry: Mr. Richard Teebay, Falwood, Preston; Mr. John Douglas, Clumber; and Mr. Edward Hewitt, Sparkbrook, Birmingham. Pigeons: Mr. F. Esquilant, Brixton; and Mr. J. Charlton, Trafalgar Street, Bradford. Rabbits: Mr. Richard Teebay.

I soon found myself amongst the Rabbits, some of which I beheld for the first time, others were familiar to my eyes; very well they looked with the sun shining on them, but not so much as to injure or annoy. In my opinion the arrangements were good; the pens were roomy and all that could be desired with one or two exceptions. A little straw or hay would have been a comfortable addition. I do not care to see so much green food given Rabbits from twenty to forty hours from their comfortable hatches where, judging from the animals' appearance, they had been abundantly supplied with better fare. I am sure the steward in charge will promise better things for next year.

The show of Rabbits was quite a success, about twice as many being shown as in the preceding year, and I see no reason why Rochdale and its twin sister Middleton should not have the best exhibitions of Rabbits in Lancashire. Mr. R. Teebay was the Judge, and with perhaps one or two exceptions gave most satisfactory awards. Of Lops there were nine entries. The splendid Black and White buck of Mr. A. H. Easton, Hull, justly deserved the position which he took here, as at many other shows, as a cup-winner; his ears were 22½ inches by 5½. The second prize was given to Mr. E. Vaughan, Market Hall, Birmingham, for a Yellow and White Rabbit, eleven months old, with ears 22 inches long by nearly 5 inches wide. The highly commended specimen from Mr. G. Johnson, Wood Street, Kettering, was good. Of Silver-Greys there were eleven entries of good, well-silenced specimens, and the first prize and a high commendation were given to Mr. E. M. Royle, of Greenhill, Rochdale, and the second prize and a high commendation to Mr. S. G. Hudson, Paragon Street, Hull, for specimens which were all that could be desired. I rather incline to the belief that the specimens most to be appreciated are those most perfectly silenced, and in this particular some beautiful Rabbits were shown. The Himalayans (six entries) were not quite so perfect as I could have wished. The first-prize specimen from Mr. B. S. Rothwell, Rochdale, and the second-prize one from Mr. James Boyle, jun., of Blackburn, were the best in some important points; yet one shown by Mr. Butterworth, Rochdale, if not equal to its more fortunate neighbours, which I rather incline to think it was, at least deserved high commendation. Strange to say, no high commendations were given in this class, yet the Silver-Greys could boast of two. In the class for "Any other Variety" there were eleven entries. An Angora, well nosed, from Mr. T. Schofield, 140, Drake Street, Rochdale, was first; the second prize going to a good Dutch Rabbit from Mr. Hudson. This little animal seemed quite proud of its grey coat and white collar. A high commendation was given to a White Angora from Mr. Joseph Butterworth, Indle Pasture,

near Rochdale. In the Selling Class (seventeen entries), a Silver-Grey, from Mr. E. M. Royds was first; the second prize going to a Loop-ear from Mr. G. Johnson, of Kettering.

The entries of Rabbits numbered fifty-four against some twenty-six last year, and let me hope the Committee, with this fact before them, will be induced to give a class more for the Angora, and not mix it up with others as this year. I feel sure the experiment will be no pecuniary loss, but that it will attract more entries to the Rabbit section of the Show, which visitors seem also to have so much pleasure in beholding.—C. K.

LYTHE POULTRY SHOW.

THE pleasant little village of Lythe, situated about four miles north-west of the now fashionable watering place Whitby, held its fourth annual Poultry Show on August 26th. The exhibition was highly creditable, both as to the number of entries and the quality of the birds, and it is not too much to say that some of the Cochins exhibited at this little village gathering were of sufficient merit to make a mark in any show in England.

The Rev. T. Phillips, Robin Hood's Bay, and W. Stonehouse, Esq., of Whitby, were Judges, and made the following awards:—

BRAHMAS.—1, Mr. Corney, Whitby. 2, Mr. Booth, Lythe. *Chickens*.—1, Mr. Corney. 2, Mr. Stephenson, Whitby. SPANISH.—1, Mr. Crowther, Lythe. 2, T. Clemmitt, Lythe. *Chickens*.—1, T. Clemmitt. 2, Mr. Stephenson. COCHIN-CHINAS.—1, J. Booth, Lythe. 2, M. G. Greenbury, Whitby. *Chickens*.—1, T. H. Readman, Whitby. 2, Mr. Elliott, Lythe. GAME.—1, Mr. Dickenson, Lythe. 2, Mr. Pringle, Epton. *Chickens*.—1, Mr. Dickenson. 2, E. Noble, Whitby. HAMBURGHS.—*Golden-spangled*.—1, J. P. Luss, Sandson. 2, J. Cooper, Mickleby. *Silver-spangled*.—1, Mr. Pickering, Barnby. 2, T. Kidd, Lythe. *Golden-pencilled*.—1, Mr. Stewart, Whitby. 2, J. W. Boyes, Lythe. *Silver-pencilled*.—1, T. H. Readman. 2, Mr. Pickering. *Gold or Silver-spangled Chickens*.—1, T. Kidd. 2, J. Pymus. *Gold or Silver-pencilled Chickens*.—1, Rev. R. A. White, Whitby. 2, T. H. Readman. BARBDOOR FOWLS.—1, Mrs. Wellburn, Barnby. 2, A. Welford, Brock Riggs. *Chickens*.—1, G. Barker, Epton. 2, Mrs. Wellburn. ANY OTHER VARIETY.—1, Percival, Whitby. 2, Mr. Dickenson. *Chickens*.—1, T. Percival. 2, Mr. Booth. *Cock*.—1, Mr. Speedy, Whitby. 2, R. White, Lythe. *GEESE*.—1, Mr. Kerr, Deep Grove. 2, Mr. White, Lythe. *DUCKS*.—1, R. Dulong, East Row. 2, Mrs. Harland, East Row. LOCAL FOWLS.—*Chickens*.—*Lane Roads*.—1, Mr. Elliott. 2, Mr. Crowther. *Small Ducks*.—1, T. Kidd. 2, R. Thompson.

MEIGLE POULTRY SHOW.

THIS was held on August 24th. The following are the awards:—

DORINGS.—*Chickens*.—1 and Cup, Mrs. A. Bruce, Westhill. Airdie. 2, D. Gellatly, Meikle. *Geese*.—1, G. Anderson, Blairgowrie. SPANISH.—*Chickens*.—1, P. Simpson, Epton. 2, J. W. Will, 3, Mrs. Anderson, Meikle. BANTAMS.—*Chickens*.—1, J. W. Will. 2, J. Anderson. GAME.—*Chickens*.—1, D. Harley, Edinburgh. 2, W. Meldrum, Forfar. *Geese*.—1, K. Nicoll, Carnoustie. 2, J. Anderson. COCHIN-CHINAS.—*Chickens*.—1, J. W. Will. 2, D. Gellatly. HAMBURGHS.—*Golden*.—*Chickens*.—1, G. Craithness, Carnoustie. 2, J. W. Will. *Silver*.—1, J. W. Will. 2, J. Macandrew, Carnoustie. BANTAMS.—*Chickens*.—1, J. Anderson. 2, J. A. Dempster, Stirling. ANY OTHER VARIETY.—*Chickens*.—2, Miss A. Anderson, Meikle. ANY DISTRICT VARIETY.—1, T. Raines, Stirling. 2, W. Meldrum, 3, J. W. Will. *Chickens*.—1, G. Cuthill. 2, P. Raines. *Geese*.—1, Mrs. A. Bruce. SELLING CLASS.—1, J. Porter, jun., Myreside. 2, P. Simpson. 3, W. Simpson, Cardean. *DUCKS*.—1, *Ighbury*.—1, D. Gellatly. 2, Mrs. A. Bruce. *Rouen*.—1, A. Easson. 2, J. W. Will. *GEESE*.—1, Mrs. Barclay, Simprin. 2 and 3, Mrs. Ballingall, Cookston. TURKEYS.—1, Mrs. Barclay. 2, Lord J. F. G. Hallyburton.

DISTRICT PRIZES.

DORINGS.—1, G. Allan. 2, D. Gellatly. 3, Mrs. A. Bruce. *Chickens*.—1 and 2, Mrs. A. Bruce. 3, J. Sinclair, Drumkillo. *Geese*.—1, G. Allan. SPANISH.—1, Mrs. Anderson. 2 and 3, A. Shepherd, Meikle. *Chickens*.—1 and 2, Tea Service, D. Gellatly. 3 and 4, Mrs. Anderson. ANY OTHER VARIETY.—1 and 3, D. Gellatly. 2, Miss A. Anderson. *Chickens*.—1 and 3, D. Gellatly. 2, Mrs. Lamond, 3, G. Cuthill. 4, J. Porter, jun., Myreside. 5, G. Allan. 6, G. Cuthill. 7, A. Bruce, Hill. *Chickens*.—1, Mrs. A. Bruce, Westhill. 2, W. Simpson. 3, G. Cuthill. *Geese*.—1, Mrs. A. Bruce, Westhill. 2, W. Simpson. 3, G. Cuthill. *Chickens*.—1, Mrs. A. Bruce, Westhill. 2, W. Simpson. 3, G. Cuthill. *Geese*.—1, 2, and 3, A. G. McNeil, Coupar Angus (Owls, Turbits, and Tumblers).

CITY COLUMBIAN SOCIETY.

ON Thursday last, August 25th, the City Columbian Society held its first show for the season at the Crown and Cushion Tavern, London Wall. The meeting was well attended by members and friends from Ireland and Scotland, as well as from all parts of England, and great was the suspense of several who were eagerly watching every bird as it was put in the pen to catch the first glimpse. The birds shown were quite up to the average of quality for which this Society is celebrated, and several of them will be seen carrying off high honours at some of the leading shows when they get a little older. It is to be regretted that the committees of public shows do not offer prizes for young birds. I feel assured the entries would repay the prize money, and would be a very attractive feature.—J. F.

BEE-KEEPING AT MANCHESTER IN 1870.

THE present season has been, as a whole, somewhat unfavourable for bees in this neighbourhood. The honeydew so abundantly collected last year, made the honey very impure and rather unhealthy. Owing to the long winter, cold spring, and impure honey, many hives were weak in numbers, in other words, had only a small population in March and April; indeed, many weak hives of bees did not survive the cold spring months, and the strong lives of bees which outlived the severe

winter and spring did not swarm early. This year there were very few swarms in May. I had only one, all the rest were June swarms. Usually most of our stocks swarm in May. Some seasons bees are loth to swarm even after they are ready; but this year all the hives that swarmed did so freely, many of them yielding second swarms.

Notwithstanding the length of time without rain, very little honey was found in flowers this season, save during the first three weeks of June and this month (August). Still, swarms kept themselves, and needed but little feeding. During the fair month of July, and in the absence of cloud or rain, hives generally became much lighter, breeding was discontinued, white drones were torn out of their cells and cast out, and drones were massacred. The drought and easterly winds continued to the loss and discouragement of bee-keepers. I had then upwards of 2,000,000 of my faithful and industrious servants near starvation point. Their commissariat stores had to be thought of. A favourable balance sheet this year was but a remote idea, if not quite out of the question. Soon—very soon 14 lbs. of sugar per day will be required to keep them alive; 28 lbs. would do it better. A twig of heather just bursting into blossom was sent from the moors. Well, heather is hardy, and not easily affected by weather. Perhaps it will yield honey while the wind is easterly. Let me try my bees there? Away they go to grouseland about the end of July and beginning of August, fifteen hives at a time every two or three days. The bees began work at once, and before the last lot arrived the first one had gained in weight several pounds per hive.

Yesterday (August 23rd) I went to see them, and, arriving about 11 a.m., I found them busy, and collecting honey rapidly. My May swarm, the best, was first uncovered and weighed; its weight was just 95 lbs., and its mother hive standing by its side was 82 lbs. Some swarms weighed 80 lbs., some 70 lbs., some 60 lbs., and some 40 lbs. At 3 p.m. the best swarm was again weighed, and found to be just 98 lbs., with many bees out at work. Some of the best hives have gained from 50 to 60 lbs. each during the last three weeks. Grand results!—a fair harvest of honey without a speck of impurity, a favourable balance-sheet after all, and the lightest of the hives have ample stores for themselves if kept for stocks.—A. PATTENREW.

BEEES BUILDING OUTSIDE THEIR HIVE.

My bees this year seem to have behaved strangely. First, I have a common straw hive with a square box at the top, the whole enclosed in a wooden stand, for the sake of warmth and shelter in winter. In order to take the box of honey from the top of the hive, I opened the door of the outer case, and found that my bees had not only filled the small square box at the top of the hive which I was going to remove, but had also made large combs filled with honey outside the box, and on the top of the straw hive (inside the outer case), so that I had some difficulty in detaching the box of honey, which when emptied was put back again. The combs outside still remain, and the bees continue working. Secondly, Another straw hive, also inside a bee case, had a glass super put on, and over that a small straw hive to keep out the light, and on opening the door of the case I find likewise outside the glass super, and inside the little straw hive (put on, as I said, to keep out the light), the bees are working combs. Is not this unusual?—C. R.

[Bees when pressed for room will extend their combs in any direction, and sometimes take possession of the outer cases intended only for the protection of their lives. All such combs should now be removed, and those portions which are available carefully preserved until next year, when they will be found useful either as guide combs or decoy combs for glasscs and supers, and when, also, somewhat more care should be taken to afford the little labourers sufficient accommodation.]

THE BEE SEASON IN SCOTLAND.

WE have now arrived at nearly the close of the bee season of 1870. In Scotland it has, on the whole, been one of a very unsatisfactory character. A cold, dry, and ungenial spring succeeded a very protracted and unfavourable winter, in which, as I formerly remarked, many weak hives, otherwise well provisioned, succumbed. The weather at the commencement of summer was more propitious, and things began to look more hopeful, but notwithstanding a continuous track of apparently

fine weather, yet further progress was not so manifest as could be wished. As the season advanced this became even more evident by a want of activity among the bees, a deficiency of pollen and honey in the flowers, and a consequent falling-off in breeding and general advancement. How is this to be accounted for? No doubt the long prevalence of dry weather operated adversely on vegetation. I think these two past seasons furnish irrefragable evidence that very dry weather is not the best for bees. For the secretion and exudation of the nectar in flowers it is necessary that there be a certain quantity of moisture. Warm weather and genial showers are the indispensable requisites for a thriving apiary, and hence in many localities I have lately visited there is both a deficiency of swarms and flower honey. There are exceptions, no doubt, but I ascribe these to the circumstance that the fall of rain was very unequally distributed in Scotland—there being plenty in some parts of the country, and a scarcity in others. For myself I have had very few natural swarms this summer, and very little flower honey in supers. It is, perhaps, yet too early to estimate the amount of honey collected at the heath. This, of course, is one of the best of honey-yielding plants, and considering the luxuriance and abundance of the crop this season, and the splendid weather we have had during its blossom, I should expect the results to be good, unless, indeed, the long drought in summer has not also affected its honey-yielding qualities. In some cases, however, I know of hives having during the past three weeks added from this source alone from 10 to 26 lbs. to their store. The heath-blossom is early this season, and will be all over, I expect, by the end of the month (August).—J. LOWE.

FEEDING BEES AND STRENGTHENING STOCKS.

FEEDING or strengthening weak stocks by giving cards of honey from strong ones is generally delayed too long. The bee-keeper will find it a great saving of syrup or honey to feed early, as the bees will deposit far more of what they take up if fed just at the close or winding-up of the honey harvest. In all localities where there is but little fall pasturage it would be well to feed in August, or at latest by the 1st of September.

At this season most of the food given them will be deposited in the cells, and capped over the same as the honey brought in from the field, which prevents its becoming sour and unfit for winter use. And if stocks are to be strengthened, it disturbs the bees far less to do so while the weather is warm, and the bees will not consume so much of what is given them if it is given early, when they are gathering a little. Feeding or giving cards also stimulates to greater industry, and seems to encourage labour in the field, when given early, before all the flowers are gone. Let bee-keepers try it, and they will not feed late afterwards. As a rule, it does not pay to keep stocks that require much feeding; still, many stocks with a very little early feeding would become good ones, and in such instances it pays to feed.—J. H. THOMAS (in *Toronto Globe*).

OUR LETTER BOX.

DORKING COCK'S FEET SWOLLEN (E. E.).—The goodness—i.e., size of the Dorking cock, is probably the cause of his swollen feet. Forgetful of his weight, he has flown off some high place, and either bruised his feet or driven a gravel stone through the skin. In either case, as soon as the apparent callosity becomes red and inflamed, there is no cure. He may be used a little longer as a stock bird, by keeping him strictly on grass, but every step on gravel is an injury to him. This disease cannot always be prevented, but something is done in that way when the perches in a house are kept scrupulously within 2 feet of the ground, and nothing allowed in the place higher than can be used as a perch.

BRAMA COCK'S COMB (Blink Bonny).—The comb is not desirable, but we do not think it a serious fault. It would be so in a single comb.

COMB OF A LIOBT BRAHMA POOTRA COCK (R. P.).—The pea-comb is more esteemed than the single comb, and is a more valuable property if a yard is for sale. Vulture hocks, as we know from experience, show distinctly before the chickens are six weeks old. With us we condemn such at once to the kitchen, or we give them to friends to whom we owe some small obligation, and who boast that to them one fowl is as good as another. We have read of a country where all the people were hump-backed, and a stranger having entered during divine service, the clergyman prayed for the deformed man who had just entered. So a friend to whom we gave some vulture hocked birds, and who bred from them, told us he had bred some nasty plain birds from them, and could not think they were pure.

CRESTED BUFF HEN WITH JONQUE CINNAMON COCK—PAIRING LIZARDS (E. E.).—It will mainly depend upon how the Crested hen is bred. If she be from a recent cross between a Cinnamon and Crested bird not being

Cinnamon, you will probably not get all Cinnamons, but some dirty greens among them, or some broken Cinnamons—i.e., splashed birds. The greater proportion, however, will be Cinnamon, Crested and plain, Jonque and Mealy. It is perfectly right to pair a Golden Lizard cock with a Silver Lizard hen.—W. A. B.

WASPS (A Miserable Victim).—We have never found wasps do any serious injury to bees, and are, therefore, unable to prescribe a remedy from actual experience. The mouth of the hive should, of course, be at once contracted, and Mr. Taylor recommends laying a piece of barley-sugar across or just within the entrance so as greatly to narrow it. "This, he says, "is so attractive to the bees, that they muster at the door in greater force than the wasps dare venture to assail. As fast as the fortification is devoured it ought to be renewed, and the out-generalled enemy will retire from a hopeless contest." Last autumn an esteemed correspondent recommended carbolic acid as a means of repelling robber bees, and it may possibly be found to be equally efficacious in deterring wasps. His advice was as follows:—"Early in the morning, or soon as corsair bees (wasps) are on the raid, dip a feather in carbolic acid and wet the entrance of the assailed hive all round, pouring at the same time a few drops on the landing. Repeat the dose during the day as the odour passes off. If properly managed the inmates will remain at home venturing, whilst not a single robber dare cross the threshold." Fruit can only be preserved from wasps by covering it with gauze.

METEOROLOGICAL OBSERVATIONS

In the Suburbs of London for the week ending August 30th.

From observations taken near London during the last forty-three years, the average day temperature of the week is 68° 2/3, and its night temperature 46 1/4. The greatest heat was 88°, on the 13th, 1855; and the lowest cold 28°, on the 12th, 1860. The greatest fall of rain was 1.27 inch.

RAMBLES ABOUT CORBRIDGE. SANDHOE.

I WAS spending the vacation at Corbridge, an old village on the Tyne, in the centre of the garden of Northumberland—an old village, nobody knows how old, with an old church, a grand old church, and an old stone bridge, very long, very narrow, and abominably dusty, with always the same old man on it with an old barrow and shovel, engaged in the manure line of business. It was a hot day—I cannot say what the glass was standing at in the shade, but the cows were all standing up to their knees in the river, illustrating the theory of perpetual motion with their tails. I sauntered down to the river-side to a small piece of what I thought was unenclosed waste ground. It looked like it, though there was an old broken rail fence on one side. I think Corbridge shoots its rubbish there when it has any to shoot. The old fence, a very shabby old fence, ran down almost to the water's edge, or what would be the water's edge when the rains swelled the river, which now, with its gravelly bed laid bare through the long drought, was lazily creeping on towards the bridge, on which I could just see the old man's head bobbing up and down above the parapet: he was evidently reaping a rich harvest of ammoniacal deposits that morning. The other side of the fence looking rather more inviting, but not much, I stepped over the rail and sat down. I cannot say I was comfortable. There was not much grass, and my seat was hard: besides, I was pestered by the flies, impertinent, inquisitive flies, with a thirst for a knowledge, geographical and anatomical, of my epidermis. It was not by any means a pleasant spot, but such as it was I was not allowed to occupy it long. A lad, who seemed half afraid or half ashamed (let us hope he was: he was a decent-looking lad) to deliver his message, came to me with an intimation that I was to "go away, go away; it's private property, private property," and then he retreated; and so did I in the face of a "notice," which I had not observed before, to the effect that if I were found trespassing on that ground, or drying my clothes on its fences, I should be prosecuted with the utmost rigour of the law. The launch of a paper ship with a dandelion mast, which I was under contract to complete for "Jacky," was deferred to a more convenient season: for which demurrage he suggested that the sum of 4*l.* would be an acceptable equivalent, to be invested in a donkey-ride. The donkey tariff in Corbridge is, with or without a saddle (which is always a side saddle, difficult to put on, and apt to slip round, but very handy to hold on by), 4*l.* an hour; ditto with cart without springs, but plenty of straw, 6*l.*

But what has this to do with Sandhoe? A good deal. The donkey took us to Sandhoe. I went rather against my inclination; I am certain he went contrary to his, though he was on the whole a well-behaved ass, not given to rubbing against walls or rolling in dusty roads. I would rather have been off among the grand old woods about Dilston than on terraced walks or among flower beds and

ribbon borders. I wanted rather to get away from Nature "with her hair cut," than to travel over hot dusty roads under a broiling July sun to see a specimen however beautiful. I was anxious to get away from the "noise and smoke of the clearings," as my eldest boy, who is great in Indian story, has it. He carries colours and chalks (war-paint he calls them) in his pocket, and when we were in the woods was continually waylaying poor Jacky, and scalping him. Once he tried to make me a party to a horrible plot, proposing that I should let him touch me up with a bit of vermilion and a flannel blue-bag, and then rush in and carry his mamma into captivity, when he would give me five minutes' start and follow my trail, and when he had rescued her, would tie me to a tree, and show me how near he could come with his knife without hitting me.

I shall never reach Sandhoe at this rate, which is just what I thought toiling up the hillside that hot July day. Once there, my only regret was that I had deferred my visit so long, and that I had not more time at disposal to examine all the beauties of the place. Sandhoe, the seat of Sir Rowland Stanley Errington, Bart., is most delightfully placed on the hillside on the left or north bank of the Tyne, about midway between Hexham and Corbridge, adjoining the lordly manor of Beaufront. The principal entrance to the grounds is through a beautiful gateway surmounted by a massive stone arch, but I entered this little paradise through a private door opening on a winding path, hedged in with Laurels of most luxuriant growth, leading to what I may call Terrace No. 1, the arrangement of the grounds being a system of terraces, a plan necessitated by the nature of the site, and worked out in detail by the head gardener, Mr. Marshall, with infinite skill.

The first terrace was a Rose walk, which my attendant, an intelligent young Scotchman, informed me is 200 yards long, and I can only describe it as one continuous bower of Roses carpeted with velvet pile. The most striking feature in it is a series of festoons formed by connecting the uprights of some rustic work on either side with light chains both longitudinally and transversely, the whole being clothed with masses of lovely Roses. The *coup d'œil* is charming.

An easy descent from this fairy palace leads to a beautiful sloping lawn stretching away in a bold circular sweep from the west-end of the house, which faces terrace No. 2, the terrace. The higher part of the lawn is scalloped its entire length with flower beds of elegant design, something like a series of inverted *fleur-de-lis*. Looking at them as they lie on the slope with the apex towards you, the outer row of plants next the grass, forming an edging to the bed, is *Cerastium something-osum*, then blue *Lobelia* and Golden *Pyrethrum* mixed, with the centre, or body of the bed, *Calceolarias* and scarlet *Geraniums* in each alternate scallop, while at the base of each stands either an Ivy-covered vase or an Irish Yew. I have never seen Ivy turned to such purposes as it is at Sandhoe. Some of the long slopes are of Ivy, and very effective they are. The west-end of the lawn is bounded by the woods of Beaufront, consisting of fine specimens of Larch, Oak, Beech, and Lime, with ornamental Pines and other Conifers on the

margin. The grass itself was in excellent trim, and I was informed they used Green's machine. I asked if they had seen the Archimedean, and produced the picture which gives Jacky so much anxiety as to how the man has broken the handle, but I fancied my attendant had some idea I was an agent fishing for an order, and was, therefore, not very communicative on the subject of grass.

The house faces terrace No. 2, and is in itself an object of great attraction to visitors, from the costly character of the internal decorations. In the front are several flower beds, in some of which Mrs. Pollock Geranium was growing in great perfection, the masses of richly-variegated foliage showing to great effect. The centre of the terrace, which is 254 yards long, and is being extended to about 600 yards, is occupied by a lawn with a ribbon border on each side; that to the south, or remote side, being edged with Flower of the Day Geranium, with rows of Calceolarias and scarlet Geraniums, intermixed with a pretty ornamental Grass, and bounded by a Yew hedge—a low, living, green wall, alone worth going to see. At either end of the lawn is an oval-shaped raised bed of four steps, the first consisting of a front of Ivy, carpeted with Calceolarias and Flower of the Day Geranium; then more Ivy, and a floor of scarlets; next Ivy, and a surface of white; then Ivy again, crowned with dwarf white Dahlias. But the most pleasing feature on this beautiful terrace was the fragrance emitted from an inscription on a tablet built into an Ivy-covered wall supporting one of the upper slopes.

"Stranger, within these grounds,
Whoe'er thou art,
No limitation of thy freedom fear;
Go where thou wilt,
And when thou wilt depart,
Since for thy pleasure all is ordered here.
"R. S. E."

It is needless to say whose initials are these, nor is it a matter of surprise to find the writer's name uttered by the poor with blessings, as well it may be, connected as it is with unostentatious acts of practical Christian charity. I will just stay to remark that this little Eden is open from morning till night to all who choose to lift the latch of any of its gates. No fear of being told it is not convenient, or that the "family" are at home, or of being warned off and told to "go away, go away; it's private property, private property!" If the "family" meet you, it will raise its hat if you be a lady, or bid you a hearty good-day and welcome if you be a gentleman; and then, if you be a true gentlewoman or gentleman, you will neither lean over the Yew hedge or press it out of shape, nor splash about in the fish pond. I saw both done, and should have thought it no sin to pitch one offender over the hedge, and baptise the other.

The slope from this terrace to the next is clothed with Ivy kept close to the ground, and a more effective foliage cannot be conceived. Along it runs what may either be called a Lime avenue or another Rose bow. The Lime trees are trained to very prettily-designed rusticwork, and are already assuming the characteristic form of the trelliswork, which will ultimately be removed. They form a beautiful leafy canopy overhead. The spaces between the trees are occupied with Roses, while here and there a straggling piece of Ivy from the slope has been allowed to add its share to the beauty of this shady retreat. At the east end is a roomy summer-house, oval-shaped, with a roof of bark thatched with heather, containing rustic tables, chairs, and lounges. More slopes, more Ivy, more flowers, and we are on the lowest terrace, in the centre of which are a large circular basin and fountain. The Yew hedge, which forms the extreme south boundary of this walk, is 3 feet high, and of the same width, clipped exactly square with astonishing accuracy.

The view from this point is very fine. The Tyne is seen running eastward for some distance. To the west, at a short distance, lies the quaint little town of Hexham, the tower of the Abbey church standing out grandly above the surrounding buildings, which seem snugly nestled in among the trees at the foot of the hills, a little cloud of bluish smoke floating over, marking its site and apparent area. Almost in front, on the further side of the river, surrounded by its majestic woods, is seen the solitary tower of Dilston Castle, a grim memorial of the bygone glories of the Derwentwater family, while stretching far beyond to the south lie the hills enclosing the valley of the Tyne. To the west is Corbridge with its church, not so pretentious, perhaps, as the more majestic pile at Hexham, but replete with interest. We pass close under its shadow as we return home. Just one word about this hoary old temple before

I say good-bye to a day whose pleasures I shall long remember. Seeing the doors open one morning, and hearing the voices of the choristers, I entered, and found that it was the celebration of Divine service on the occasion of one of the festivals of the Church. Perhaps I was impelled by curiosity, for I had heard of the ritualistic services of Corbridge. What a blind thing is prejudice! I had been led by hearsay to expect to see nothing less than a cloven hoof peeping from beneath the caesock, but I could perceive nothing but the cross elevated with a majestic simplicity. The congregation was not large, as might easily be expected in a country village on a week day, but the service was most impressively rendered by the vicar, the Rev. Mr. Gipps, M.A. He kindly spent fully an hour, nay more, after service was over in pointing out to me every object of interest in the building, which has been only lately restored under his own immediate superintendence. A more enthusiastic ecclesiastical antiquarian it has never been my pleasure to meet; and bringing to bear on the subject a scholarly mind, he invested every stone in the old church with a history of its own, converting old grey, time-eaten blocks by a touch of his magician's wand into living testimonies of that undying faith which our forefathers handed down to us. It was plainly to be seen, too, how the desolating effects of war had visited the sacred building. Here in one corner of the noble tower are unmistakable evidences of the troopers in the border warfare, or in the bloody wars of the Roses, having bivouacked under its shelter, and in another are the marks where they sharpened their pikes upon its corner stones, while the effects of fire are observable everywhere. I said it was an old church, a very old church, nobody knows how old, and so it is.—W. A. BLAKSTON.

BEDDING PLANTS IN 1870.

(Continued from page 148.)

In continuing my remarks on bedding Geraniums, I come next to the reds, as Mrs. Laing, King of the Nosegays, and Rebecca.

Mrs. Laing is very dwarf and free-flowering, and is a very useful sort, as it seems to stand weather well; the colour is rather dull. King of the Nosegays has a very fine truss, and is of good habit; it is a bright shade of red, and deserves a trial everywhere.

Rebecca, though free-flowering, has run to seed with me very much this year, and I have heard the same complaint from others. It is one of the very best, however, for pot culture for winter blooming.

I will next take the cerise-coloured, as Violet Hill, Duchess, Amy Hogg, Dr. Hogg, Arthur Pearson, &c.

Violet Hill is still my type of the best bedding Geranium I have ever seen. It only requires good treatment to remain in full beauty all the summer months. It is very compact and dwarf, branches naturally, and is one of the freest bloomers both as a bedder and a pot plant I have ever seen. It is not much in nurserymen's hands, because it requires time to propagate a stock of it, and in some gardens it has been discarded because it has not grown enough, but it will well repay any extra care in saving all old plants, and liberally manuring the beds before planting; for however freely it may be made to grow, it will always blossom as freely.

Duchess is a good sort for a back row, and it did well this dry summer in Gloucestershire, but it is too coarse most seasons. It is another good sort for winter blooming.

Amy Hogg is too well known to require much comment. I still think it too long in the footstalk. Arthur Pearson is very like Amy Hogg, with rather a rounder flower, and stronger footstalk.

Dr. Hogg is a decided improvement on Amy Hogg—a very bright telling colour without being gaudy, and a free bloomer. It is rather apt to run to seed, but this has been too much the case with most Geraniums this year. It makes a beautiful pot plant, and is one of the freest bloomers of any in the winter. It is altogether a very valuable variety.

Comte de Morny is one of the best Zonals, as it has naturally a branching habit; its colour is more pink than Amy Hogg, and it is decidedly the best bedder I know in that colour.

Roi d'Italie and Glorious are much about the same shade of colour, cerise with an orange shade. Roi d'Italie has fine individual flowers but small trusses, and does not stand weather well. Glorious has done well this year.

Indian Yellow has a very peculiar shade of colour, is one of the freest-blooming Geraniums of any, and is always worth

growing as a contrast to other colours. It stands sun and rain better than almost any variety I know.

I have only tried two orange-coloured Geraniums this year—viz., Orange Nosegay and Grace Holmes. The latter is, in my opinion, a great acquisition, very dwarf and free-blooming, and will, like Violet Hill, stand good treatment, when it will flower freely without growing coarse. Orange Nosegay is of a good colour, but too small in the truss, and does not bloom freely enough.

We next come to the pink and rose section.

Of these Rose Rendatler is *facile princeps* with me, and has proved itself the best for four years. On some soils it is coarse; here both old plants and young bloom freely, and stand the weather well. Its fault, which it has in common with all pinks, is its tendency to run to seed.

Ne Plus Ultra is a very fine shade of pink with a good truss of flowers. I do not think, however, it blooms freely enough.

Blue Bell is too coarse with me, but it is a different shade of colour—a lilac pink—has a handsome truss of bloom, and I shall certainly try it again, as I think for the sake of variety, and to prevent monotony, one cannot have too many different shades of colour.

Pink Perfection is a fairly good sort. Pink Stella does not bloom enough, and after three years' trial I shall discard it.

Comtesse de Rosslyn, which I had not enough of for a separate bed, and which I planted in a mixed bed, is a promising sort, with a dwarf habit, but more lilac than rose.

Christine Nosegay has also a nice dwarf habit with a soft light shade of pink, but hardly blooms freely enough, and is too stiff in the growth.

Gloire de Corbenay was the only salmon-coloured Geranium I hedded this year, and it has done better than any salmon I ever tried before, having had to discard Eugénie Mezard, François Desbois, Madame Kundersdorff, and others. I shall certainly try it again, and I think it will succeed.

All the whites I have ever tried have turned to a dirty pink in the sun, but they have all been so like their prototype, Madame Vaucher, as for all practical purposes to be identical; but one which was sent me on trial by Mr. C. Turner has kept its colour well, is of quite a different habit, and seems to me most promising, and I intend to give it a good trial next year. Another good dwarf white which has kept its colour was kindly sent me as a present by Mr. Aldred, and will, I think, bed well.

I will defer my notes on the Bicolors, Tricolors, and Variegated sorts till another time. I would only conclude now by saying, if I had to choose twelve (not counting newer sorts), one of each colour, I should take the following:—Waltham Seedling, Bayard, Cybister, Grand Duke, Violet Hill, Duchess of Sutherland, Dr. Hogg, Indian Yellow, Grace Holmes, Gloire de Corbenay, Rose Rendatler, and The Bride. I have included the latter though a new one, as I do not know any white of the Madame Vaucher type worth growing. I can also unhesitatingly recommend Vesta, Lady C. Grosvenor, Douglas Pearson, Thomas Speed, William Thomson, Lady Hawley, Lady Kirkland, and Stanstead Rival.

Since writing the above notes we have had heavy rain, 0.92 inch in one night, and the sorts which have stood it best are Waltham Seedling, Bayard, Violet Hill, and Indian Yellow.—C. P. PEACH.

BUSH VINES IN POTS.

MR. PEARSON'S account of the pot Vines at Chatsworth has much interested me; perhaps some of your readers may like to know what may be done with pot Vines grown as bushes about 5 feet high, including the pot. I have ten pot Vines fruiting in 13-inch pots on a raised border in a cold vinery, the roof being covered with border Vines; they are two years old, and no fruit was taken from them last year, which may account for their fruitfulness this year.

In November last they were pruned according to Mr. Rivers's directions. The earth 4 inches down the pots was taken out, all roots springing from the stem cut off to an inch in length, and the vacant space filled with fresh earth (clayey loam), and plenty of half-inch bones, well rammed down. Nothing was done in the way of painting the stems. The pots were then laid on their sides on a south-east border, a little earth was thrown up round them, and the Vines bore 13° of frost without injury. In the middle of February they were set in their places; all buds were allowed to break, and stopped at one joint beyond the bunch of bloom. As soon as the berries were set they had a plentiful top dressing of malt screenings and

horse droppings in equal quantities, a second edition of the same when the berries began the second swelling, plentiful supplies of tepid water throughout, and liquid manure of sheep droppings, *à la* Pearson, twice a-week until colour appeared. A good crop has been the reward of the trouble which the watering and general treatment entail. Two Black Hamburgs have five bunches each, Black Frontignan three, Sweet-water nine, Black Bordeaux ten, Frankenthal four, Muscat of Alexandria seven, Muscat St. Laurent six, Royal Muscadine seven, and a Black Hamburg, grown through a 6-inch pot, bears six bunches. The last-named Vine has now two sets of roots, the lower in a 13-inch pot, the upper in a 6-inch pot, and when the Grapes are ripe, by dividing the stem between the two pots I hope to have a handsome ornament for the sideboard.

I may add, that the Muscat St. Laurent, which Mr. Pearson describes, or abuses, as a "worthless little early Grape, with an objectionable Muscat flavour," has with me large bunches and fine oval berries of a yellowish-green colour. I have not cut any, so can say nothing about the flavour, but it is worth something to look at.—V. W. PORHAM, *Portreath, Cornwall*.

BEEF FOR A FLOWER GARDEN.

At page 113 I saw an article on Beet for decorative purposes, and I fully agree with your correspondent that Beet is certainly out of place anywhere but in the kitchen garden. This year I purchased seed of a well-known firm, and when ready I planted out in the flower border in places where I should otherwise have put Colens had I not heard the Beet so highly spoken of. I have been thoroughly disappointed with the result of my experiment for, instead of separating the lines of colour as I had intended, the Beet has simply overgrown everything, notwithstanding the bushels of leaves that have been cut off. Some of the leaves are now 30 inches high instead of about 12 inches, the height those in my kitchen garden usually attain. Now I want cuttings of Tom Thumb Geraniums and Calceolarias, which plants the Beet divides, but positively have none. My only apparent resource is to cut down the wretched Beet (which I intend doing next week), that my legitimate bedding plants may grow more freely.—H. GAINSFORD GUTTO.

NOTES ON POTATOES, CUCUMBERS, AND ROSES.

I MENTIONED in my last that I had here (Somerset), planted several varieties of Potatoes in rows on the same piece of ground, using to each row 1 lb. of seed cut in sets. The following were the kinds—Early Rose, Climax, Bresee's Prolific, Bresee's King of the Earlies, Carter's Queen of Potatoes, Carter's Ashtop Fluke, Rivers's Royal, Sutton's Racehorse, and Kelway's Nonpareil. Rivers's Royal, Climax, Nonpareil, and Early Rose were up a little before the rest. They all met with that severe frost which was so general, and I looked out one morning to find them all as black as a coal. I thought to myself, Here is an end to my trial and my prize seed; but they came round, and I give the result. The first I dug was Climax, and well pleased was I to find that my 1 lb. had produced 17 lbs. of fine, large, good-looking tubers. I must add that at least one-third of the sets of this variety were quite killed by the frost; it seems to be the most delicate of all. Of Bresee's Prolific I had 29 lbs.; King of the Earlies, 25 lbs.; Kelway's Nonpareil, 27 lbs.; Carter's Queen of Potatoes, 10 lbs.; Ashtop Fluke, 9 lbs.; Rivers's Royal, 11 lbs.; and Sutton's Racehorse, 7 lbs.; but when I came to Early Rose I could scarcely believe my eyes when I found that I had 52 lbs. of enormous tubers with scarcely a small one amongst them. I was prepared to receive the Yankee character of this Potato with one or two large "grains of salt," but the result has surprised me beyond measure. In my whole stock of twenty-four varieties I give the palm, taking all qualities into consideration, to Early Rose and Nonpareil.

My Roses this year, as a whole, have been good. I have had splendid blooms on Alfred Colomb, Xavier Olibo, Baroness de Rothschild, Princess Mary of Cambridge, Marguerite de St. Amand, La France, Christine Nilsson, and Pierre Notting. Duke of Edinburgh, Edward Morren, Clémence Raoux, and Lord Macaulay, with some of the other dark Perpetuals, have been so infested with mildew that as yet my blooms have been indifferent. I have grown very fond of Archimède, Monsieur Fortado, Meiret, and Fortune's New Yellow, among Teas. I

shall expect to show some good examples of them this autumn.

I have this year had a beautiful show with Arab and Egyptian Queen, among Golden Geraniums. I much prefer the Bicolors to the Tricolors, for a show *en masse*; they seem to me to make a far brighter bed.

I have tried a great many different Cucumbers during the last year. Two plants of Carter's Champion were placed in my frame, heated with hot-water pipes, the last week in October, and I cut fruit from them up to May, when I wanted my frame for Melon plants, so cleared them out. I had the pleasure of giving away seven Cucumbers for Christmas-day, and during the whole winter I never was in want of that useful fruit.—STIFF SOIL.

P.S.—I should have said that I tried Paterson's Bovinia, with the rest of the Potatoes; I had literally nothing but haulm for my pains.

NOTES ON STRAWBERRIES.

"Doctor Hogg (Bradley).—Very large, handsome, rich, a great bearer, and of very healthy growth. Perfection." Having grown this Strawberry for the last three years, I can endorse the above description as given in the catalogue of Mrs. Nicholson, of Yarm, for 1868—69.

The soil of this garden is not one favourable to the Strawberry, being of a light character, of no great depth, and resting upon what we in Derbyshire call a "ratchely" bottom—that is, a substratum of loose stones, and inert, hungry sandy matter, which probably in its turn rests upon the rock, as a solid floor of gritstone rock crops out some 50 yards from the south-western corner of the kitchen garden wall, and at no great depth from its level. I found some years ago that that type of a good Strawberry, the British Queen, would neither grow nor bear satisfactorily here, and consequently the variety ceased to be grown, along with some others which at different times have shared the same fate, such as Old Pine, Fibert Pine, Oscar, Carolina Superba, Crimson Queen, Rivers's Eliza, Kimberley, &c. Out of a somewhat large number of varieties, I three years ago reduced my principal stock to three—viz., Dr. Hogg, La Constante, and Sir Joseph Paxton, with smaller quantities of Sir Harry, an excellent Strawberry, Elton Pine for late crop, and Black Prince, which is still a useful early kind. I have for trial next year, and awaiting the trenching of a piece of ground for their reception, runners of Lucas, Vicomtesse Héricart de Thury, Mr. Radcliffe, President, Cockscob, and John Powell nicely established in small pots. I am afraid I shall not greatly improve on my three favourites as given above, or notably on the first-named and subject of my text, Dr. Hogg, though I suppose that it has in Mr. Radcliffe a formidable rival for honours in this class. I must say, however, as an honest chronicler of facts, that Sir Joseph Paxton (for the first time with me) has this season been affected with mildew to a serious extent. I am afraid there must be some hereditary predisposition to that disease on the part of Sir Joseph Paxton, as I see Mr. Douglas reports the same at page 140. I see at page 121 that John Powell is placed in the *index expurgatorius*.

I find that in this soil it is very undesirable practice to fruit the same plants more than three years, but by securing runners early, and layering them in pots, I obtain well-established plants that produce a fair quota of fruit the first year of fruiting; the second year the fruit will be both fine and abundant; and probably the third year there may be an abundant crop, but the fruit will be very sensibly less in size. I am not certain but that, if ground and time were plentiful, it would not be better to take but two crops off the same plants. On soils more congenial to the plant, the necessity for a constant migration of the Strawberry quarter may be less. To all cultivators of light-land gardens I would say, in the present state of my experience with reference to the different varieties of Strawberries, commend me to Dr. Hogg.—W. HUDSON, *Chase Cliffe, Derby*.

THE COMMON BERBERRY.

In most shrubberies which have been established for any length of time will be found a plant of this in the background, cut and hacked as if its presence there were only tolerated as a nuisance, yet the wild Berberry, when grown to perfection, is one of the most handsome of our deciduous shrubs, especially when covered with ripe fruit. Some years ago I was forcibly struck with this on visiting Drumlanrig Castle, the princely

seat of the Duke of Buccleuch, in Dumfriesshire, where single specimens of this shrub were dotted about amongst Spruce Firs and other Conifers on the more distant parts of the lawn. Instead of the miserable, one-sided, half-cut-away objects we often meet with in a mixed shrubbery, there were single specimens of conical shape loaded with the ripening fruit, and looking, when seen from a distance, like so many huge Fuchsia bushes, differing widely from the miserable objects we often see struggling for an existence amongst plants of more robust growth. Despite the cutting it experienced on account of its medical virtues, it still struggled on, but at Drumlanrig it was all in its glory. Whether the rainy climate, or the soil partaking of the Scottish Highland character, was more favourable to it than other lowland parts I cannot say, but certainly the plants which I saw there in the early part of September were models of beauty, and I believe had received very little, if any, pruning. The handsome fruit of the wild Berberry certainly entitles it to more attention than *Berberis dulcis* and some similar species; for although these flower pretty well, they bear but little fruit, and very often none at all; while the wild Berberry is as prolific as a Currant or any other fruit.—J. ROBSON.

GROWING ZONAL GERANIUMS FOR EXHIBITION.

YEARS ago, when one saw in a schedule of prizes a class for three, or four, or six "Scarlet Geraniums," the intending exhibitor had no difficulty in understanding what was required, for at that time the number of varieties was limited to those having more or less of this shade of colour in the flowers. Then, when with an increase of varieties came some having flowers with quite pale colours, the limitation of "Scarlet Geraniums," though always widely interpreted as inclusive of a certain class rather than of a certain shade of colour, was felt to be somewhat absurd; and in time that gave place to "Zonal Pelargoniums," the former again widely interpreted as taking in all that section known as "Scarlet Geraniums," though having flowers of various hues and leaves destitute of the zone common to many of them. A better botanical knowledge also led to the substitution of the generic term *Pelargonium* for *Geranium*. A wonderful improvement has gone on in these plants during the past twenty years; and tracing forwards from the circle of bright colour in the flowers of the well-known Tom Thumb, it has been seen to change, like a chromatope, into a wondrous variety of shades of colour and types of flowers, that now form at summer and autumn exhibitions some of their brightest and most effective features. The general term "scarlet," still found in some schedules of prizes, has become a misnomer. We are no longer confined to that sole colour, but have a range from the purest white, as found in Purity, to the deep crimson scarlet of Sambo. Thus it is easy and possible to stage, in a collection of six, nine, or twelve plants, as many shades of colour; and there is not a good variety in cultivation at the present day of which a well-grown plant does not constitute a striking and beautiful object. But classes and varieties have developed as well as colours; and the Zonal *Pelargonium*, swelling into importance with its high-sounding name, has assumed double forms that bid fair to become formidable rivals to the single varieties, either for exhibition or for decorative purposes. It is true the range of colour in the flowers is as yet somewhat restricted; but that is a drawback that probably will not long exist, whilst it is also largely compensated for by the more permanent character of the flowers, which retain their petals and consequent usefulness for a much longer period. The Nosegay section has usually a separate class also allotted to it, because it differs in its general features somewhat distinctly from the original Zonal kinds; but later varieties have exhibited such an approximation in the form of the pip to that of the best of the Zonal section, whilst retaining all the Nosegay freedom of growth and floriferous character of truss, that we may naturally look by-and-by to such a fusion of the two divisions as shall result in one improved type that will swallow up the distinction, but leave us, nevertheless, a section perfect in beauty and in form, and possessing all those features that make the Nosegays so popular both for bedding and pot-culture.

Perhaps it will not be out of place to state at the outset that there is no exhibition plant that appears more to dislike training, or less to require a formal severity of shape, than the *Pelargonium*; and yet, in spite of these facts, there are to be

found plenty of judges ready and willing to make leading awards to plants that have been subjected to a degree of training and torture that would be ridiculous were it not that it is almost disgusting in appearance. Who that has visited metropolitan shows is not familiar with those flattened surfaces bearing a resemblance to giant floral Mushrooms? or, if you like, flower beds upon wire? What a miserable parody on plants do these things present, tortured and twisted out of natural form, devoid of all grace and beauty! They add another instance of the fitness of the saying, "that Nature gave us form and outline, and humanity alone are its despoilers."

As a reverse to this, I have lately seen staged for competition at a provincial show a lot of pillar-trained plants, from 4 to 6 feet in height, certainly fairly flowered, but, nevertheless, looking so ungainly as to merit ridicule rather than praise. Unfortunately against them there was no competition, otherwise I should have viewed with some interest the awards of the judges, as, in spite of size and flower, I could not conceive that any sensible men would have placed these statuesque abortions before well and naturally-grown specimens. As a mode of training to obtain plenty of bloom the pillar plant may be very useful, but for exhibition it only deserves disqualification.

My specimens have usually been prepared for autumn exhibition—say in the beginning of September; and having this in view, I get some cuttings and put them, in early in the previous year, and when well rooted, potted-up into 48's to stand the winter, giving the shoots their first stopping. In an ordinary greenhouse these plants will not make much growth during the winter, but by the beginning of April will be ready for a shift into 32's, giving any robust shoots another pinching. Plenty of air and light are necessary now to maintain robust short-jointed growth, and by the time the pots are well filled with roots the cold weather will have passed away, and the external air may be safely trusted. To save much needless labour, a shift should now be made into the blooming-pots (No. 12 is a good size for that purpose); and as the plants are to remain in these for a long time, a really good compost should be used, nothing being better than yellow loam, well-rotted manure, especially cow dung, and a fair mixture of sand. I find it desirable to pot firmly, otherwise the soil will settle very much by the autumn, and, therefore, it is better to make it all the firmer at the first. When the plants are thus potted, and especially potted low down, an open situation in the garden is selected that is convenient for watering. A good, hard, and level bottom should be secured, or, if soft beneath, pieces of slate should be used to place the pots upon, to exclude the worms. Here the plants should be placed at proper distances from each other to admit of growth without crowding, and then filled-in all round to the brim of the pots with ashes or some other good plunging material, so that the roots are thus protected from the force of the sun's rays, and consequent drought and exhaustion. The bedding Pelargonium can bear almost any amount of solar heat with impunity if its roots are kept moist and cool. As I usually put my plants in the open air at the end of May, and get them under glass from a week to ten days only before showing, they thus get about three months of thorough exposure to the weather, and are as dwarf and short-jointed as could possibly be wished. Of course, the process of stopping has not been neglected, but rather has been maintained with constant regularity, every strong shoot having its extremity nipped out as fast as it had made three or four joints, care being taken also to encourage the centre growth, so as to secure a somewhat rounded form. An occasional turning round of the plants will also facilitate the production of a good shape. Pinching out all points and flower-buds is rigidly continued until within one month of the time of showing, when the process is discontinued, and the plants are allowed to grow away as freely as they please.

As a result of all this careful attention and exposure, the grower will find that he has a lot of robust, dwarf, bushy plants, that will now commence to throw up a mass of flower well above the foliage, that will, when expanded, need but the finish of a week or so under glass to make them perfect specimens. There are no yellow or discoloured leaves to be seen, all is fresh and vigorous; and the plants, after they have brought the highest honours at the show, will, with a little attention, make a greenhouse or conservatory look very gay indeed nearly up to Christmas.

The Zonal Pelargonium is naturally a gross feeder, and will take up an abundance of strong diet. The use of such material, however, to plants in the open ground would have a

most undesirable tendency. This objection does not exist in the case of pot plants, as the roots, being confined within a contracted space, are necessarily subject to different conditions, and need stimulants to maintain that free growth so essential to the production of good specimens. Any application of liquid manure is scarcely needed until the flowering pots have become filled with a mass of roots; but when such is the case—and that would probably result in about six weeks from potting—then a watering of a weak mixture twice a-week is desirable; and this dose may be increased in strength when the bloom is allowed to come up, as the claim on the resources of the plants will be proportionately increased. Horse droppings well soaked in water usually make good liquid manure, and even stronger stuff than that may be used, such as guano water, drainings from cow sheds, and even from the closet cesspool, as I have used this latter during the past summer in the proportion of one bucketful to about five of water with the best results. Amateur growers, especially, may take my word for it that they will secure better specimen plants in moderate-sized pots with a free use of liquid manure than they can obtain in large pots under any conditions, besides the credit of having produced as good or even better results in small pots than their fellow-competitors have realised in large ones.

Readers will have observed that I have not proposed the tying down or pegging of the plants in any way, and I say certainly not, as all these processes are to me highly objectionable. I strongly contend that it should be the object and purpose of all exhibitors to produce specimen plants that have been as little as possible subjected to training with ties or sticks in any shape or fashion. Especially does this apply to the Zonal Pelargonium, as training of any description other than that induced by stopping is both unnecessary and absurd. I have now ready for show a fine lot of dwarf compact plants, with close rounded heads, each about 2½ inches in diameter, and which will be larger still in a few weeks hence. Flower stems are being thrown up all over them, and I have every reason to be satisfied with the prospect.

The treatment that is here so strongly recommended for the Zonal section bears with equal force to the growth of the Nosegays, with the exception that some of the latter require less pinching, otherwise I make no distinction as to treatment. The double Pelargoniums are now rapidly becoming popular, and have become at many shows a class of themselves; and exceedingly attractive they are when well-grown specimens. With these pinching must be performed with rather more moderation, but should still be carefully attended to, otherwise the plants will soon become leggy. If well looked after and grown as herein described, plants as dwarf and compact, and almost as free of flower as the single varieties, can easily be produced.

I shall conclude with a list of twelve good show Zonals, the same number of Nosegays, and six double-flowering Pelargoniums, all of which will well repay good cultivation.

ZONALS.		
Purity. Clipper. Rosabella. Excellent.	Sambo. William Underwood. Beaute de Suresnes. Lord Derby.	Highgate Rival. Madame Madeline. Dr. Lindley. Madame Werle.

—EXHIBITOR (in *The Gardener*).

OSBORNS' SELECT RED BEET, ALIAS DELL'S BEET.

Your number of August 25th contains an article on the so-called Dell's Beet, justly praising it for its decorative qualities, and expressing some doubts as to its retaining for any length of time the same character. Now on this point we can speak from experience. Nearly twenty years ago we had this same Beet from Mr. Bogue, the intelligent gardener at Gorbambury, near St. Albans (under whom Mr. Dell once acted as foreman), and distributed it under the simple name of "Fine Dwarf Red Beet," until the year 1866, when it became spoken of as a very useful decorative plant, and to prevent confusion, with Mr. Bogue's consent, we affixed our name to it, and have con-

tinued to grow it extensively for seed at our Sunbury nursery, where a large quarter may now be seen as true to character as when it was first sent out, and admired by everyone who sees it, for its decorative effect.—OSBORN & SONS, Fulham Nursery, S.W.

METROPOLITAN FLORAL SOCIETY'S FIRST SHOW.

SEPTEMBER 6TH, 7TH, AND 8TH.

AN autumn show of florists' flowers—a show which would bring together at one time the early autumn flowers from a number of exhibitors in all parts of the country, has been a long-felt want among florists. The Crystal Palace Autumn Show was given up some years ago, because it did not pay, and the subjects of exhibition at that show were mainly flowers of the description just referred to and fruit. Since then there has been a blank, which has only been to some extent filled by the Floral Committee meetings at Kensington, but it was felt that larger prizes should be offered to bring competitors from a distance and in sufficient numbers to create an autumn exhibition equal to those held at the Crystal Palace some years ago, and which would be worthy of English florists. The Rev. H. H. Donbrain conceived some time ago the happy idea of resuscitating an autumn show at the Palace, he was supported with great spirit, and the result has been a complete success, for the show, which opened on Tuesday and will close this evening, is better than most of its predecessors at the same season at the Palace, there being, as we are given to understand, fully double the number of entries. Of the quality it is impossible to speak too highly—the Dahlias with but few exceptions are equal to those produced in the best of seasons, and in some stands even better than in more favourable years. The Gladioli are excellent, Hollyhocks good, and Roses good for the time of year. The Society may therefore be congratulated on the success of this their first exhibition, and it only wants a little more encouragement, and that encouragement we are convinced will be given, to render its exhibitions permanent. Now that one part of the Autumn Show at the Palace has been renewed, would it not be desirable to make an effort to restore the other—fruit?

In the class for forty-eight Show Dahlias, Mr. Keynes, of Salisbury, is first with splendid blooms of John Kirby, Queen of Beauties, Vice-President, Annie Neville, Gazelle, Lightning, Flag of Truce, Heroine, Amy Creed, James Cocker, Mary Keynes, Octoroon, Princess of Prussia, Miss Henshaw, William Lucas, Mrs. Eckford, very beautiful, Mrs. Thornhill, Flora Wyatt, Yellow Boy, Toison d'Or, Matilda, Mr. Dix, Lady Jane Ellis, Sir Greville Smyth, Lady of the Lake, James Backhouse, Golden Drop, Hon. Miss Herbert, Lilac Queen, Victory, Mrs. Bann, James Hunter, Julia Wyatt, John Harrison, Mrs. Boston, incomparable, Lady Gladys Herbert, King of Primroses, Emperor, Netty Buckle, Memorial, Jenny Austin, George White, Earl of Pembroke, Leah, splendid, and Norfolk Hero. Mr. H. May, of Bedale, is second with an excellent stand; John Dunnington, Baron Tannton, Memorial, High Sheriff, and Miss Henshaw being remarkably fine; while Mr. J. Harrison, of Darlington, and Mr. G. Edwards, of York, are respectively third and fourth, each having fine-sized, symmetrical blooms. Messrs. Kimberley; Milner, of Bradford; Draycott, of Hunsbstone; and Mr. Searle, of Sevenoaks, also exhibit good stands.

The best thirty-six come from Messrs. Draycott, who are first with a very even and fine set of blooms, consisting of Gazelle, Lady Jane Ellis, Norfolk Hero, Heroine, Lord Derby, Criterion, Volunteer, Annie Neville, John Dunnington, James Hunter, Blushing Fifteen, Julia Wyatt, Memorial, Princess of Wales, Mr. Dix, very fine, Firefly, Lilac Queen, Leah, Flag of Truce, Vice-President, Triomphe de Peep, John Kirby, Hon. Mrs. Wellesley, Miss Henshaw, British Triumph, Yellow Perfection, Eclipse, Mrs. Thornhill, Mrs. Boston, James Bennett, Juno, Lord Palmerston, Lady G. Herbert, George Brown, King of Primroses, and Sir G. Smythe. Mr. May, of Bedale, is second, and Mr. Keynes, of Salisbury, is third, each with fine blooms, Mr. Harrison, of Darlington, being fourth.

The best twenty-four come from Mr. Walker, of Thame, and comprise fine examples of Yellow Boy, Mr. Dix, John Kirby, Gazelle, Norfolk Hero, Hugh Miller, George White, Champion, and Mrs. Boston. Messrs. Kelway, of Langport, Somerset, are second; Mr. Clark and Mr. Pilcher, of Horsham, are respectively third and fourth.

By far the best stand in the amateurs' classes is Mr. C. J. Perry's twenty-four. In this there are very fine blooms of Lord Shaftesbury, Pink of Perfection, Head Master, Mr. Dix, King of Primroses, High Sheriff, Lady G. Herbert, Memorial, Andrew Dodds, Leah, Flag of Truce, George Brown, and Queen of Beauties; second, Mr. Pettfield, with excellent blooms; third, Mr. Burditt, Wandsworth Common; and fourth, Mr. R. Hopkins, New Brentford.

In twelves, the prizes went to Mr. J. P. Martin, Henfield, Sussex; Mr. Fewkes, Birmingham; Mr. Glassecock, Bishop Stortford; and Mr. Fry, Taunton.

The Fancy Dahlias are not very numerously represented; the best six in the amateurs' class are from Mr. C. J. Perry, and are Fanny Sturt, Pauline, Lightning, Prospero, Grand Sultan, and Bitterfly. Mr. Pettfield is second; Mr. Burditt third with large blooms; and Mr.

Fewkes fourth. In the nurserymen's class for twenty-four, Mr. Keynes is first with splendid blooms of Flora Wyatt, Flossie Williams, Sparkler, Hero of York, John Salter, Fanny Sturt, Chameleon, Leopardress, Richard Dean, and Attraction. Mr. May, of Bedale, is second with large blooms; and Mr. Draycott has a remarkably fine stand, in which Stafford's Gem, an old but most beautiful variety, rosy purple tipped with gold, is ever welcome; third, Mr. Walker; fourth, Mr. Edwards.

A first-class certificate was given for seedling Annie Hobbs, white self, shown by Mr. Hobbs, of Lewer Easton, Bristol; and a similar award was made to Fancy Dahlias, Flora Wyatt, buff ground tipped with purplish red; and Richard Dean, yellow, dotted and tipped with dark crimson. Excelsior, rosy purple, and Princess Mary of Cambridge, white, from Mr. Kimberley, of Coventry, are large well-built flowers, the latter less so than the former. James Cocker, rosy purple; and John Neville, yellow, are also very promising selfs.

Of Gladioli there is a very good though not large display. Messrs. Kelway take the first prize for thirty-six with fine spikes of Meyerbeer, Circe, Norma, Rosa perfecta, Etendard, Adolphe Brongniart, Prince Imperial, James Veitch (splendid), Eurydice, Sultane, Moliere, Marshal Bazaine, Lacede, Mr. Eyles, Madame Desportes, and Vandyke, and some others mostly as good. Mr. G. Wheeler, of Warminster, is second. For twenty-four Messrs. Stuart & Mein, of Kelse, are first with, among others, splendid examples of Madame Desportes, Robert Fortune, Delicatissima, Michel Ange (very fine colour), Meyerbeer, Marechal Vaillant, Moliere, and Bernard de Jossien. The second prize goes to Messrs. Draycott for a stand in which Virgile is conspicuous among several good spikes; the third and fourth prizes being taken by Mr. Edwards, of York, and Mr. Walker, of Thame. The best twelve come from Mr. Fry, of Taunton. In this stand are fine spikes of Etendard, Rosa perfecta, Moliere, and Ulysse. The second prize is taken by the Rev. H. H. Donbrain with excellent examples of Eleanor Norman, Madame Dembrain, Madame Furtado, Norma, and others. For six Mr. G. Rickwood, Ikley, Leeds, is first; Mr. Minchin, Hook Norton, being second.

Asters afford a very good display, although not so large on the whole as we have seen at former shows, a fact easily explicable by the extraordinary character of the season. The best thirty-six French come from Mr. G. Wheeler, the second best from Mr. W. Sandford, gardener to T. Thomasset, Esq., Maidenhead. The largest of these measure 4 inches across. The third prize was awarded to Mr. Walker, of Thame, and the fourth to Mr. H. Minchin. The best twelve come from Mr. G. Matthews, of High Street, Shore-ditch, who takes the first prize for beautifully incured flowers almost like show Chrysanthemums. Mr. Pettfield, gardener to G. Thornhill, Esq., Diddington, is second, and Mr. Jennings, of Shipston-on-Stour, third.

Of the German or Quilled Asters there is a good show, those from Mr. Wheeler, of Warminster, being particularly noteworthy. Two flowers in his stand, white bordered with violet, are very conspicuous. The second prize for twenty-four went to Mr. Walker, for blooms which, though larger, are not so refined; and the third to Mr. Betteridge, of Chipping Norton.

Verbenas are not numerously shown, but mostly excellent. Mr. Perry, of Castle Bromwich, takes the lead with remarkably fine trosses, of which Rev. C. Peach (purple), Mrs. George Prince, Mauve Ring, Modere, Edwin Day, Mrs. Mole, Diana, Rev. S. Hole (a lilac seedling), and Velocipede are most conspicuous. The second, third, and fourth prizes are taken respectively by Mr. Minchin; Mr. Fewkes, Birmingham; and Mr. Burditt, of Wandsworth.

Hollyhocks are shown both in spikes and as cut blooms. The best nine spikes are from Mr. Minchin; Mr. Chater, of Saffron Walden, being second; and Mr. Harrison, Darlington, third. As a whole the cut spikes are not so fine as we have seen. In cut blooms, Mr. Chater, of Saffron Walden, takes the first prize, and Mr. Minchin the second with blooms between which it would be difficult to decide; Mr. Harrison is third, and Messrs. Draycott fourth. For twelve blooms the prizes went to Messrs. Minchin, Fry, and Rickwood.

Cut Roses are shown by Messrs. Paul & Son, Keynes, Coppin among nurserymen, and by Messrs. Exell, Parnell, Perry, and Soder among amateurs, and are fair specimens for the time of year. Each of these exhibitors takes a prize.

In baskets or vases of cut flowers for table decoration, Miss A. Hassard, is first with a stand having Ferns, Grasses, and Pelargoniums in the bottom dish, and the top dish similarly filled, with the addition of *Lilium lancifolium*, the whole surmounted with an elegant egrette of Grasses, pink Pelargoniums, and blue Lobelias. The second prize went to Mr. Soder, gardener to O. Hanbury, Esq.; the third to Mrs. Donbrain, Westwell Vicarage, for a basket of Ferns, Caladiums, Vinca, Pelargoniums, Roses, Zinnias, and Stephanotis. Mr. D. McKay, of Sudbury, sent a stand of African Marigolds; Messrs. E. G. Henderson & Co., baskets of Tricolor Pelargoniums; and Messrs. Carter and Messrs. Downie, Laird, & Laing sent fine groups of plants, which were very tastefully arranged in front of the orchestra. For these special certificates were given; and certificates of the first class were likewise awarded to Messrs. Downie & Co. for Pelargonium Pink Queen; to Messrs. Paul & Son for *Cnrepussonia pendula alba*, a pretty variegated form of that handsome species; to Mr. Appleby for his simple and effective fumigator, and to Mr. Chapman for his excellent flower and fruit cases, which have been frequently noticed as admirable contrivances for transporting cut

blooms uninjured to a distance. Lastly, Mr. Chaff, gardener to A. Smee, Esq., Carshalton, sent some large specimens of Kitchen Apples, including Lord Derby, Lord Suffield, and Warner's King.

At the Judges' dinner on the first day of the Show, the Rev. H. Dombraïn presided, the Rev. C. P. Peach occupying the vice chair. Among those present were Messrs. Turner, Holmes, Dean, Fraser, Kinghorn, Standish, Cutbush, Edmunds, Lidgard, P. Barr, Wilkinson, Shirley Hubbard, Keynes, and several leading florists. After the usual loyal toasts the Chairman gave the Crystal Palace Company coupled with the name of Mr. Wilkinson, who, in replying, regretted the necessity which the managers had been under of discontinuing the Autumn Show, and expressed his pleasure at its revival under the auspices of the Metropolitan Florists' Society. Mr. Keynes in proposing "Success to the Metropolitan Florists' Society," coupled with the name of Mr. Dombraïn, said their meeting that evening put him in mind of old times, and expressed his great satisfaction at the excellence of the Show. The Chairman in acknowledging the toast remarked that he had received the most thorough encouragement from florists and amateurs, and that the entries had been nearly double the number of those at the last Crystal Palace Autumn Show. He trusted that the present Show would be the commencement of something that would permanently aid the cultivation of florists' flowers. Several additional subscriptions having been announced for next year, the meeting broke up.

ROYAL HORTICULTURAL SOCIETY.

SEPTEMBER 7TH.

THE subjects submitted to the Committees on this occasion were somewhat numerous, though those for which prizes were offered were only shown to a limited extent. The weather was extremely unfavourable, and the attendance of visitors proportionably small. Many of the plants, however, were very interesting, and in almost all cases good culture was evident.

Dahlias, Verbenas, and Liliams were the special objects of the day, but the show of these formed only a small portion of the whole, yet what were shown were shown well.

The show of Dahlias was but small, but the blooms excellent. In Class 1, for twenty-four, Mr. Walker, Thame, was first with Chairman, Julia Wyatt, Mentor, Flag of Truce, John Dunnington, Prince, Autocrat, Netty Buckle, Toison d'Or, Annie Neville, Gazelle, Mrs. Walker, Norfolk Hero, Lady Jane Ellis, George White, Queen of Beauties, Mr. Dix, Jenny Austin, Rosy Circle, Commander, Ne Plus Ultra, and Lottie Atkins. Mr. Burditt, gardener to C. Lambert, Esq., Wandsworth, was second.

In Class 2, for twelve, Mr. R. Hopkins, of New Brentford, was first with very fine blooms of Annie Neville, Chancellor, Sir Greville Smyth, British Triumph, Lady Gladys Herbert, and others also very good; Mr. Burditt was second with a good stand, and Mr. Adams, Wyke Green, was third. Mr. C. J. Perry sent excellent blooms, which, however, were too late for competition.

Several stands of seedlings were sent. Second-class certificates were awarded to Flower of Kent, yellow self, from Mr. Harris, of Orpington; and to Mrs. Watts, blush tipped with purplish lilac, from Mr. Parker, Maiden's Green, Winkfield, a very pretty variety.

Of Verbenas, Mr. C. J. Perry sent the only stand in his usual excellent style, including several seedlings, but these were too late for competition.

The only exhibitor of Liliams was Mr. W. Bull, who had a first prize for *laucifolium album* and *rubrum*, *L. tigrinum splendens*, *L. tigrinum Fortunei*, and *L. auratum maculatum*, the last named a beautifully marked variety with large segments and broad bands. The whole of these were most admirable specimens.

FLORAL COMMITTEE.—Mr. J. Fraser in the chair. From Mr. Pilcher, gardener to S. Rucker, Esq., Wandsworth, came a fine group of *Nerines*, of which the splendid scarlet heads of bloom, along with *Vallota purpurea*, formed conspicuous objects at one end of the room, Mr. King, gardener to S. Wiggett, Esq., Allanby Park, Binfield, sent two varieties of *Coleus* named *Bella Donna* and *Leopard*; the latter, green, veined and blotched at the base of the leaves with velvety dark purple, the prettier of the two. A special certificate was awarded to Mr. Denning, gardener to Lord Londesborough, for a fine collection of *Orchids*, in which were beautiful specimens of *Arides suavisimum*, *Cattleya superba*, splendid in colour; *Polycaenis muscifera*, *Burlingtonia venusta*, the rich yellow *Dendrobium chrysanthum*, *Oncidium incurvum*, remarkably fine; *Miltonia candida grandiflora*, and *Arides Hanthii*.

Messrs. Veitch also received a special certificate for a collection in which was a magnificent specimen of the white *Lapageria*, a plant of *Begonia Veitchii* in perfect health, bearing several of its showy scarlet flowers, and which had stood out of doors unprotected for the last three years, a number of elegant *Palms*, fine specimens of *Arides*, *Cattleyas*, *Lælias*, and other *Orchids*, new *Crotons*, and *Dracenas*, and several *Ferns*. First-class certificates were awarded to *Daphne elegantissima*, a variegated form of *D. indica*, in which the leaves are contorted and are edged with cream colour, a very pretty plant; to *Calamagrostis cinnamomea*, an elegant *Palm*; *Adiantum pervianum*, a

noble *Fern* with pinnæ of immense size; and to *Livistonia rotundifolia*, a handsome dwarf *Palm*.

Mr. Bull likewise received a special certificate for a very extensive collection, consisting of *Palms*, *Lilium auratum* in fine bloom, *Godwinia gigas*, the white *Lapageria*, *Cassia calliantha*, a very pretty plant; the variegated *Carex lucida recurvata*, *Ferns*, and *Dracenas*. A first-class certificate was given for *Damonoreps cinnamomea*, an elegant dwarf *Palm* with the young fronds cinnamon-coloured. *Chno-carpus dealbatus*, with glaucous foliage, is also an elegant *Palm*. *Ptychosperma nobilis*, a very handsome *Palm*, with the back of the leaves of a coppery tinge, formed a striking object in this collection, in which we also noted *Macadamia ternifolia*.

A special certificate was given to Messrs. Osborn & Sons, of the Fulham Nursery, for *Grevillea Banksii* of Hooker, producing two heads of its crimson and yellow flowers. A first-class certificate was awarded to G. F. Wilson, Esq., for cut spikes of *Lilium Leichtlinii* grown in the open border, the flowers having the segments recurved like the *Tiger Lily*, yellow, spotted with brownish crimson. Accompanying these was a splendid spike of the *Tiger Lily* of gigantic growth from an open border, likewise splendidly coloured flowers of *Lilium speciosum rubrum*. Messrs. E. G. Henderson & Son, Wellington Nurseries, had a special certificate for baskets of *Silver Tricolor Lass* of Gowrie and *Golden Tricolor Peter Grieve*, with the leaves beautifully coloured. Messrs. Henderson likewise sent a collection of *Tricolors* in small pots.

From Messrs. J. & C. Lee, came a very interesting collection of cut specimens of hardy trees and shrubs, which had a special certificate; from Messrs. Carter & Co., of Holborn, flowers of a large variety of *Lilium speciosum*, imported from Japan; from Messrs. Bell & Thorpe, of Stratford-on-Avon, nicely-marked *Petunias* and seedling *Pelargoniums*, of which *David Garrick*, a *Nosegay*, with immense trusses of crimson scarlet flowers with a glow of purple, received a first-class certificate, a distinction which it thoroughly deserved. Mr. Cocks, gardener to G. S. Cudwell, Esq., Clapham, exhibited several seedling *Colenses* and a yellow-leaved *Pelargonium*. Mr. Cannell, of Woolwich, sent a pretty *Gold* and *Bronze Pelargonium*, called *Champion* and *Pride of Kent*, with scarlet flowers 2 inches in diameter, and fine, very dark-zoned foliage; also Mrs. J. C. Mappin, white-variegated and white-flowered.

Mr. Eckford, gardener to the Earl of Radnor, Coleshill, had a second-class certificate for *Verbena Miss Charlotte Mildmay*, rose, with a pale edge. He also sent *Rose Imperial*, with very large pipes of a lilac rose colour, *Lavender Queen*, a pretty variety, and two other seedlings, likewise seedling *Dahlias*. Mr. Searle, gardener to R. C. Steel, Esq., Marlesford Lodge, Hammersmith, sent *Lobelia Miss Steel*, of a very dark blue, with a rather large white eye, a very effective variety, though, perhaps, not sufficiently distinct.

Mr. Green, gardener to W. Wilson Saunders, Esq., Hillfield, Reigate, sent a most interesting collection. *Stangeria paradoxa*, of which there was the female plant in fruit, as well as the male plant bearing two cones of indolescence, received a special certificate. This, we believe, is the first time the plant has ripened fruit in this country. A second-class certificate was given for *Griffithia dryades*, with violet blue flowers, white in the centre of the segments. *Amaryllis Belladonna pallida*, a pretty variety, pale blush, more or less tinged with pink, came from the same exhibitor.

Messrs. Lee, of Hammersmith, had a first-class certificate for *Thuja semper-aurea*, a beautiful golden *Arbor-Vitæ*, far more golden than the *Thuja aurea* sent for comparison.

Mr. H. Bennett, Manor Farm Nursery, Stapleford, sent a box of *Clarence Raoux Rose*; Mr. George, gardener to Miss Nicholson, Putney Heath, stands of cut flowers of seedling *Nosegay Pelargoniums*; and Mr. Green, gardener to W. Wilson Saunders, Esq., a new Composite plant from *Chirique*, with ample foliage silvery at the back. A special certificate was given to Mr. C. J. Perry for his collection of seedling *Verbenas* previously noticed.

FRUIT COMMITTEE.—G. F. Wilson, Esq., F.R.S., in the chair. On this occasion prizes were offered by Messrs. Osborn, of Fulham, for the best bunch of *Golden Champion Grape*, but, unfortunately, there was hardly any competition. Mr. Sage, gardener to Earl Browlow, Ashridge, took the first prize with bunches which were large, symmetrical, and with large berries, though rather green in colour, each bunch weighing 3 lbs. Mr. Douglas, gardener to F. Whitourn, Esq., Loxford Hall, Ilford, had bunches of the same *Grape* from a *Vine* grafted on *Trentham Black*, and the latter seemed to have imported some of the dark hue and oval shape of its berries into the *Golden Champion*; the berries, too, were very much smaller than those of that kind generally are. From G. F. Wilson, Esq., came *Early Ascot Frontignan*, which he had found to be valuable for cold orchard-house cultivation, being a fortnight earlier than *Chasselas Musqué*, alongside of which it had been grown. The latter, exhibited from the same house, was decidedly unripe, while the former was perfectly so, and of delicious flavour.

Mr. C. Noble, of Bagshot, sent a seedling *Peach*, *The Lady*, which was considered to be no improvement on existing varieties; and a seedling *Nectarine* resembling *Pitmaston Orange* was also exhibited. Messrs. Lee sent *Royal Vineyard Peach* grown on pot trees; this variety is considered to be very hardy.

Mr. Sage, Ashridge, exhibited a small collection of *Apples*, *Figs*, and *Filberts*; Mr. Francis Dancer, of Little Sutton, Chiswick, Pond's

Seedling and other Plums, of which the excellence justified his high reputation as a cultivator of this fruit; and Mr. Cox, of Redleaf, Bnyard's Early Apple, a small but excellent variety. Messrs. Carter and Co. exhibited their Chinese Mustard, together with the white and black kinds, but the Chinese, though delicate and pungent, was not considered sufficiently distinct for an award. Mr. Clarke, of Whitton, exhibited Whitton Pippin, a very showy high-coloured Apple; Mr. Catlough, Chelsea, a fine specimen of Puffball; Mr. Sage, of Ashridge, fine heads for the season of Dwarf White Celery; and Mr. Cadger, of Luton Hoo, three seedling Cucumbers of great size, but coarse. Mr. Dean sent fine Onions under the name of Danvers' Yellow selected from plants raised from Vilmerin's seed, but the Committee considered they were not the true Danvers' Onion. Finally, Messrs. Sutton and Sons, of Reading, had a fine collection of fifty kinds of Potatoes, to which a special certificate was given.

GENERAL MEETING.—W. Wilson Saunders, Esq., F.R.S., in the chair. The Chairman, in opening the proceedings, regretted the absence of the Rev. Joshua Dix, who had been struck down by serious illness, but who, he was glad to learn, was on the previous evening very much better, and called on Mr. Moore to report the awards of the Floral Committee. This having been done, and Mr. Wilson having performed a similar task as regards the Fruit Committee, the Chairman, in the absence of Mr. Berkeley, pointed out the most remarkable of the plants exhibited, first noticing the beautiful group of *Nerine Fothergilli* and *Vallota purpurea* from Mr. Incker's gardener. Of the latter plant it was evident there were two varieties in the collection; the one was the plant as originally received, the other the plant as improved by raising from seed and crossing. The increased size of the petals and flower was most noticeable, added to which a yellowish tinge had been imported into it, all tending to show that the plant had entered upon the road to variation. It was a highly ornamental plant, and the great secret of its successful cultivation was to keep it in a greenhouse temperature, with the soil damp at all times. The singular *Godwinia* from Mr. Ball, with its mottled stem-like leafstalk and single leaf, was then pointed out, and several of Messrs. Lee's specimens of ornamental trees and shrubs were also noticed, especially the variegated *Cornel* and *Judas-tree*, *Quercus Concordia*, and a Lime tree with leaves which, instead of being cordate, were lobed in all fashions. *Lilium Leichtlinii* next came under notice, and it was remarked that the plants which attracted the attention of one generation of men were passed over by other generations, that the attention of one set of men was attracted to one thing, that of another set to another; but the Lily had held its ground for several thousands of years. That referred to, he thought, would be produced some day in great perfection. The Chairman then called attention to the *Stangeria paradoxa* from his own garden—a plant which had been a puzzle to botanists, but on which he expected further light would soon be thrown. The result of placing stamiferous and female plants together some three months ago had been the fruit before the meeting.

The Chairman said he had now to state that the Council had come to the determination to hold the country show of 1871 at Nottingham, and the show there, not being in conjunction with the Royal Agricultural Society's show, would take place at a season when plants were to be seen in their greatest perfection. The date had not been as yet fixed, but it would be announced at the next meeting, September 21st.

GARIBALDI STRAWBERRY.

In a recent issue I noticed a correspondent recommending a new Strawberry named Garibaldi. Now, I do not want to question the veracity of those sending the Strawberry out by this name as a new one, but suffice it to say that last year a Strawberry was sent out under that name, and which has now been proved to be *Vicomtesse Hélicart de Thury*. Many people are still sceptical as to the value of this Strawberry. I can with confidence recommend it as the most useful Strawberry in cultivation. It appears to adapt itself to every soil and climate. While other Strawberries droop and fade it remains fresh and green, and bears an enormous quantity of peculiar-flavoured fruit. As a proof of its great productiveness when true, two rows of one hundred plants each, as a trial, and very badly grown by a market gardener, produced 400 lbs.; and at Glasgow June Show Mr. Matthew Campbell, nurseryman, Blantyre, exhibited three plants taken from a field of thousands, where all were equally good, with one hundred ripe Strawberries and more than two hundred altogether, and it was allowed by competent judges to be fully 3 lbs. on each plant.—W. THOMSON.

LILIUM ACUTUM.—A bulb of the above fine Lily was planted by Mr. A. Anderson, gardener to J. C. Burns, Esq., Glenlee, Hamilton, about three years since in a 14-inch pot, and once shifted into an 18-inch one, the plant has this year grown to

the height of from 10 to 12 feet, carrying 120 flowers—a number which I have not yet seen excelled.—W. T.

THE GARDEN PINK FOR FORCING PURPOSES.

THE Garden Pink, in its several varieties, has always been, and will, no doubt, long continue to be, a special favourite. Everybody loves the modest beauty and delightful fragrance of its flowers, and many consider it as only inferior to the Rose itself. One or two varieties of this Pink have been generally found very useful for forcing into flower during the winter and early spring months; and I would here call attention to a few other sorts, well suited to the same purpose, but which are not so well known as they should be.

The varieties mostly used for forcing are the Common, or London White, a fragrant and very useful sort; and a larger dark variety known by the name of Anne Boleyn, and which produces exceedingly beautiful and very sweet-scented flowers, but has the great drawback of being addicted to bursting its pod or calyx. Observing and regretting this defect, an enthusiastic amateur florist, Rowland Dalton, Esq., of Bury St. Edmunds, many years since, after much perseverance, succeeded in originating a variety with flowers of the same colour, somewhat smaller, similar in habit, equally fragrant, and possessed of all the forcing properties of Anne Boleyn, but with the advantage of having a strong, well-formed calyx, which never by any chance bursts; and this very useful variety was named Claude. He afterwards succeeded in raising another still more beautiful variety, which he named Plato, and this is a truly magnificent flower of a beautiful rose colour, with a finely-formed, strong calyx, quite free from bursting, and it proves to be also a fine forcing sort, coming into flower earlier than Anne Boleyn.

Another amateur florist residing in the same town, Mr. J. Clarke, who has made the cultivation of the Pink quite a speciality, has, amongst many other triumphs in that way, originated an exceedingly fine variety resembling the old favourite Anne Boleyn, but a great improvement upon it, being more compact in habit, and producing in wonderful abundance finely-formed, large, sweet-scented flowers, with a firm strong calyx, which never bursts. This fine variety, which is exceedingly well adapted for forcing, was named Garibaldi. The same raiser also originated another splendid sort, which he named Clarke's Lord Lyons, but this variety, although exceedingly beautiful, is in all respects very nearly identical with Dalton's Plato. Some years since the Messrs. E. G. Henderson and Son sent out a most useful variety under the name of Most Welcome. This is also excellent for the purpose of forcing, and may be considered as an almost perpetual flowerer, in addition to which it is possessed of all the qualities of a first-class florists' flower, and is quite free from bursting, either when forced, or when grown in the open air.

The treatment of these plants for the purpose of forcing is so very simple, that little need be here said upon the subject. During the month of March, or early in April, cuttings should be taken from plants which have been forced, and inserted in a compost made up of sand and sifted leaf soil, using pots of some 6 inches diameter; place them in a gentle hotbed, and in all respects treat them as cuttings of *Verbenas*, although they will not root so quickly as the latter. When rooted, pot them singly into 3-inch pots, and gradually harden off, and towards the end of May or early in June plant them out in the open border, in any convenient situation, in rows about 15 inches apart, and about 1 foot from plant to plant. While here let them have abundance of water when required.

During the first fortnight of October they should be carefully raised and potted into pots some 5 inches or 6 inches in diameter, using soil composed of turfy loam, enriched with a little well-rotted hotbed manure, or leaf soil. They should be placed in a shaded position for a short time, and ultimately wintered in a cold pit, from which they are to be introduced to the forcing-house as may be required. When this is done, it is necessary that the plants be kept as close to the glass as possible. Perhaps no better situation can be found for them than a shelf on the back wall of an early vinery or Peach house at some 18 inches from the glass.

With the varieties I have mentioned—viz., Common White, Claude, Garibaldi, Plato or Lord Lyons, and Most Welcome, assisted by a few of the perpetual or winter-flowering *Carnations* and *Picotees*, little difficulty will be found in keeping up

an ample supply of these fragrant flowers throughout the entire year.—P. GRIEVE, *Culford*.—(Florist and Pomologist.)

A LARGE OAK TREE.

On the outskirts of the park of Sir William Smith Marriott, Bart, of Horsemonds, in Kent, stands a very fine Oak tree with a healthy top and straight bole. The circumference, at about 5 feet from the ground and in the smallest part between the root-claws and the first branch, is 21 feet, the bole appearing to be perfectly sound, or at all events there is no outward indication of decay of any consequence. The appearance of the upper part of the tree would indicate that the decline of life had scarcely, if at all, set in. Some limbs had been broken off, but these looked more as if by the effects of high winds or other accidents than the decay of nature; and the top, as a whole, was not so large as is often met with in much smaller trees. The situation was on the top of a slight embankment, caused by the making of a sort of dry moat or excavation 5 or 6 feet deep, the roots of the noble tree clasping the sides of the bank, and presenting an extended mass of root timber rarely met with, showing their naked surfaces along the side of the bank for some distance, swollen and enlarged so as to resemble a kind of irregular ribbed work, and finally disappearing at the bottom of the moat, which was perfectly dry. The soil, I should think, was of the kind common in the neighbourhood—a decomposed sandstone, and sandstone formed the substratum; it was evidently well suited to the growth of this tree by the good examples to be seen around.

Another fine tree is pointed out as having been all but sacrificed at one time to a mistake. Some workmen sent to cut oak timber in this park had actually stripped the bark of the lower part of the trunk prior to felling it, when the mistake was discovered, and the bark nailed on again so carefully that no vestige of the operation is to be seen, excepting a ring mark round the tree at about 3 feet from the ground. This tree, although much less than that previously noticed, is a fine specimen, and I believe tempting offers have been made for it by purveyors to the navy and others. The hole where the girth was made is as nearly circular as could be guessed, and free from any bulges or swellings that increase the measurement. I should think that at 30 feet up it would be 16 or 17 feet in circumference. It grows on the escarpment of a moat, which may, for anything I know to the contrary, have formed the boundary of an entrenched camp.—J. ROBSON.

BLUEBELLS AND HAREBELLS.

In your Journal of August 25th, page 151, I read, "The common wood Hyacinth is the *Scilla nonscripta* of botanists, the Harebell of common nomenclature." I presume you mean the "Bluebell" of common nomenclature. *Campanula rotundifolia* is the Hare (or Hair) Bell, but I believe it is usual to call both "Bluebells," though the *Campanula* is "the Bluebell of Scotland."—BLUEBELL.

[It is quite certain that the Harebell is the *Hyacinthus non-scriptus*, or *Scilla nonscripta*. Two of our oldest botanical writers, Gerard and Parkinson, portrait it, and call it "Harebells," probably from the Anglo-Saxon, *har*, grey, and *belle*, a bell. The "Bluebell" is the *Campanula rotundifolia*, according to our best modern authorities, but when or by whom the name was first applied we cannot tell, for all the old herbalists call it the "Small round-leaved Bell-flower." The name "Hairbell" applied to this flower on account of the fine hair-like stalk of the flowers, is of very modern invention, though probably for its aptness it is adopted by Babington and Hooker. Dr. Hogg in his "Vegetable Kingdom," says that *C. rotundifolia* is "the lovely little Scotch Bluebell." We have always heard it so called, and we will conclude by quoting—

"Then strike the loud harp to the land of the river,
The mountain, the valley, with all their wild spells;
And shout in the chorus for ever and ever,
The Bluebells of Scotland, the Scottish Bluebells."]

NEW AMERICAN POTATOES.

SEEING the interest that is felt in the new American Potatoes which have been so highly spoken of, I forward the results of a trial on a small scale, which may be interesting to some of your readers, and is strictly reliable, as I weighed and counted the Potatoes myself. The Potatoes were imported in December, and planted on January 21st. A large proportion in weight of

each kind consisted of handsome useable Potatoes, but in the count and weights given I have included every small tuber down to the size of a marble. I may remark, that having so few of each sort I cut them into as many sets as there were eyes, and no doubt the produce would have been much larger had small seed Potatoes of the same weight been planted. The five Canadian Kidneys sent to me prove to be identical with a similar number I received from my brother in Canada four years ago, and from which I have succeeded in raising a large stock. I have no hesitation in saying that it is the best eating Potato I ever met with, and has the valuable property of keeping good until late in the year.

Early Rose.—Four Potatoes, weighing 1 lb. 5½ ozs., cut into twenty sets, and dug on July 28th quite ripe, producing 161 Potatoes weighing 21 lbs. 6 ozs.

Garnet Chili.—Five Potatoes, weighing 2 lbs. 4½ ozs., cut into twenty-eight sets, and dug on August 31st not quite ripe, but had begun to grow again, producing 212 Potatoes weighing 50½ lbs.

Canadian Kidney.—Five Potatoes, weighing 2 lbs. 1 oz., cut into twenty-seven sets, and dug on August 1st quite ripe, producing 160 Potatoes weighing 32 lbs. 12½ ozs.—JOHN J. STONE, *Seyhorwen, Llanelisant*.

ROSES NEW AND OLD.

I ALWAYS read Mr. Radclyffe's and Mr. Kent's contributions to Rose lore. They do not purloin and hash-up other men's thoughts, but write independently from their own observation and experience: there is, consequently, a freshness and individuality about what they offer. Further, Blechingley and Okeford Fitzpaine are far apart, and the soils are so diverse that it is interesting to know how differing seasons affect the varieties of Roses, whether new or old, in different localities and soils. I can quite understand that a new Rose, when the stock is limited to two or three plants, does not always reveal its true character for one or even two seasons, and it is better to speak under reserve when doubts exist, than to speak positively and have to retract. The latter plan does not really inform, although it may appear to do so, but it often misleads. The "latest intelligence" is, doubtless, important when the authenticity of it can be guaranteed. But the experience of life is beginning to teach me not to be guided so much by the thing said, as by who says it.

The best dozen of the older Roses were with me this year—Alfred Colomb, Baron Haussman, Edward Morren (not always good but sometimes very fine), Elie Morel, Horace Vernet, Madame Fillion, Madame Noman (valuable as a white), Mille Marie Rdy, Marie Baumann, Monsieur Journeaux, Perfection de Lyon, Souvenir de Monsieur Boll (very fine on the old but not so good on the young plants), and Souvenir de Monsieur Poteau. It will be observed that I have avoided here the very old kinds, on the assumption that their merits and demerits are already sufficiently well known. My soil is strong, cool, and moist, and my system of cultivation is directed to the development of bone and muscle rather than of fatty matter.

Of the new Roses I speak under reservation, but the following have been satisfactory with me:—*Hybrid Perpetuals*: Albion, Baron Charand, Comtesse d'Oxford, Louis Van Houtte, Madame Dustour, Mademoiselle Eugénie Verdier, Marquise de Castellane, Paul Neron, and Princess Christian. *Tea-scented*: Belle Lyonnaise, Madame Ducher, and Madame Hippolyte Jamain. *Perpetual Moss*: Madame William Paul. I find that I have in each case given a baker's dozen, but full measure is a good rule, and seldom leads to difficulties.—WILLIAM PAUL, *Paul's Nurseries, Waltham Cross, N.*

FLOWER-BED ARRANGEMENTS.

YOU frequently tell us in "our Journal" that you make a rule of not offering suggestions for planting flower gardens, but you criticise plans sent to you of those planted. Now, myself and two sisters are fond of flowers (the fat baby don't take much notice of them yet), and we have a small flower garden laid out on the grass, a copy of which we enclose for your inspection. We all claim our separate beds, though at planting time we pay due regard to order, and so have the beds to match with each other. In the afternoons we spend many happy moments in picking off dead flowers, and otherwise making things look neat. As we are but little girls we cannot mow the grass, but two of our father's men run the machine over it once a-week. Next year we want a perfect arrangement of colours,

though this year the beds in themselves are as good as they can be. We have no failures, though the yellow Pansies are hardly up to the mark for bedding. Beds 10 and 11 are grand, and as for 2 and 3 we cannot describe their glories. My father wishes Mr. Peach could see them and another bed or two that we have elsewhere of William Thomson and Douglas Pearson, and then he says he would not write about such rubbish as Waltham Seedling and others as useless. Bed 8 is also grand, and you must tell everybody who wants an effective bed to grow Miss Kingsbury.

The following is the way the beds are planted:—Bed 1, *Centaurea candidissima*, edged with *Amaranthus melancholicus* tuber, with a terra cotta vase in the centre filled with Violet Hill Nosegay, and margined with a pretty variegated Ivy-leaved Geranium; all very good. Bed 2, Bayard Geranium, edged with *Cerastium tomentosum*. Bed 3, William Underwood, edged the same as bed No. 2. Beds 4 and 5, Amy Hogg Geranium, edged with yellow Pansies. Beds 6 and 7, Geranium Madame Rindersdorff. Bed 8, Miss Kingsbury Geranium, edged with Blue Lobelia. Bed 9, Bijou Geranium, edged the same as bed 8. Miss Kingsbury is the best white-edged Geranium. Beds 10 and 11, Mrs. Pollock Geranium, edged with *Cerastium tomentosum* and *Lobelia speciosa* in links of about 15 inches long all round the beds, and a few plants of *Verbena venosa* interspersed among the Geraniums, the effect of which is good. Beds 12 and 13 are *Verbena Purple King*, edged with Cloth of Gold Geranium, and are very good. All the plants have grown well, and we could not wish them to be better. All we want is a different arrangement of colours. Now we hope our old friends will help us—we should have liked to have said our "old Gooseberries."—SARAH ANN, CLARA, AND AMY ALICE, *Geranium Cottage, Beulah*.

[The reading of your letter does one good. We are sorry to say that we feel almost helpless as regards advising you to do better. One thing we may note, however, with respect to the garden; the centre is as simple and neat as it well can be, consisting of a circle, with another circle divided into four clumps round it. The circles and two ends are all that could be wished, as all are bounded by curved lines so pleasant to the eye. The

object to the sameness, we would edge all these four beds with a string of small plants of the Feverfew, and have a line behind of the Alyssum and the Lobelia mixed; 6 and 7 might be edged with *Cerastium*, and a thin line of purple *Verbena* inside would improve it. Nos. 8 and 9 we would edge with a bluish purple *Verbena*, with a string of *Cerastium* round it, and thus the four beds would be something alike; 10 and 11 cannot be improved; we think we see the looping of the Lobelia. 12 and 13 are no doubt neat, but the big leaf of the Cloth of Gold is rather too much for the Purple King *Verbena*. We would be inclined to centre the beds with yellow *Calceolaria*, and then fill up with the purple *Verbena*. The "Old Gooseberries" have expressed even these ideas, however, with great diffidence.—Eps.]

two clumps 6 and 7, with their irregular six-sided straight lines, break in on the general regularity. A bed smaller, but shaped like those round the circle, made with the ends concave to suit the circle on each side, would, we think, be more appropriate. As you do things so well, we would like to see you try a 14-inch mowing machine, even if two should work it. You cannot tell how much we admire the good sense which leads you, though having separate beds under your especial control, yet to agree so to plant that the whole garden shall form a harmonious whole. Under similar circumstances we often see nothing but confusion, owing to each young lady following her individual tastes. Where there cannot be such agreement as to planting, as in your case, we think it best that every young lady should have a bed or beds, far apart, so that each could be judged separately.

In making a change in No. 1, you could place scarlet in the centre of the vase, draped as now, or with the white Ivy-leaved Geranium; then fill the bed with *Coleus Verschaffelti*, and edge with the Centaures, or, better still, with *Polemonium caruleum variegatum*, as at Woburn. The four beds round you can hardly be better, and you might edge all alike, or two and two; but if you had a whitish edging for No. 1 we would not have *Cerastium* for 2 and 3, but a mixture of variegated Alyssum and blue Lobelia. Instead of yellow Pansies we would edge the other two with Golden Feverfew. If you did not

object to the sameness, we would edge all these four beds with a string of small plants of the Feverfew, and have a line behind of the Alyssum and the Lobelia mixed; 6 and 7 might be edged with *Cerastium*, and a thin line of purple *Verbena* inside would improve it. Nos. 8 and 9 we would edge with a bluish purple *Verbena*, with a string of *Cerastium* round it, and thus the four beds would be something alike; 10 and 11 cannot be improved; we think we see the looping of the Lobelia. 12 and 13 are no doubt neat, but the big leaf of the Cloth of Gold is rather too much for the Purple King *Verbena*. We would be inclined to centre the beds with yellow *Calceolaria*, and then fill up with the purple *Verbena*. The "Old Gooseberries" have expressed even these ideas, however, with great diffidence.—Eps.]

WINTER-BLOOMING ORCHIDS.—No. 6.

LÆLIA.

I SHALL now resume my brief notes upon this subject; I very much regretted my inability to continue them in due course, but 1870 has been an unusually busy season with me, and the exceptional weather we have experienced has materially increased my work.

The genus *Lælia* bears a strong resemblance to *Cattleya*, and to an ordinary observer it would be impossible to point out the difference, which lies only in the last-named having four pollen masses, whilst the other has eight; indeed, one of the highest living authorities upon these plants merges both genera into *Epidendrum*, an arrangement which is not likely to find much favour with English Orchid-growers, however correct it may be in a scientific point of view.

The genus now under consideration contains many fine species, some of them summer-flowering, which, as a matter of course, must be left out in this place, and I will, therefore, proceed to give a brief description of the charms, and how to produce them, of the kinds flowering in winter. A fact very much in favour of these plants is, that most of them are amenable to cool treatment; those which require to be grown in pots should have good drainage, and be potted in equal

parts of fibrous peat and sphagnum moss, adding some pieces of charcoal. During the growing season an abundant supply of water may be given, both from the watering-pot and syringe, at the same time strictly observing that none is allowed to lie in the sheaths which envelope the young growths, for if this occurs ruin is most likely to follow and that speedily. After growth is completed gradually withhold water until the short dull days set in, when only just sufficient must be given to prevent shrivelling until the flowers begin to swell, when a little extra warmth and moisture will be advantageous. Should any of the plants show signs of shrivelling remove them to a warmer place and water carefully, it is a sign the energies of the plant have been overtaxed.

L. ACUMINATA should be grown upon a block of wood, and made fast to it with a little sphagnum moss. I have seen it grown in pots, but it makes comparatively little root, and in a pot it is apt to rot. The flowers are produced, several together, upon the top of a slender scape proceeding from the apex of the short, somewhat ovate pseudo-bulbs. The leaf is short and oblong, thick, and dark green. The sepals and petals are of a waxy white; the lip is also white, stained towards the

base with a dark rosy purple blotch. It blooms in the very depth of winter, and if the flowers are not wetted it retains its beauty several weeks. For bouquets it is very useful, and for gracing a lady's hair it is very effective. It is a native of Mexico.

L. ACUMINATA PEDUNCULARIS.—This resembles the preceding in general appearance, and manner and time of flowering. It is considered by many a distinct species, but it has little but colour, in my opinion, to distinguish it, the flowers being of a uniform rosy purple, offering a lovely contrast to the waxy white of *L. acuminata*. Native of Mexico.

L. ANCEPS.—A plant of robust habit, which thrives best in a pot. The pseudo-bulbs and leaves are dark green, and from 6 to 12 inches in length, the latter oblong-acuminate. The flowers are produced, several together, upon a stem about

18 inches long. They are thick and fleshy, and last a very long time without the least sign of fading. The sepals and petals are in colour soft rosy lilac, whilst the lip is suffused with various shades of rich dark purple. The entire flower measures about 3 inches in diameter. This is a most pleasing and useful kind. Native of Mexico.

L. ANCEPS DAWSONII.—This charming variety is of recent introduction, and is still very rare. The habit is exactly that of *L. anceps*; the flowers, however, are very different, for the sepals and petals are of the purest waxy white, whilst the rich purple lip is relieved with the addition of white lobes, and is tinged with yellow. It requires the same treatment as the preceding. Native of Mexico.

L. ALBIDA.—This species should be grown upon a block of wood, and as it is very reasonable in price it is within the reach

Lælia superbiens.

of all; therefore I say, Have several large blocks of it in the collection, for it is one of the most elegant winter-blooming plants it is possible to conceive. The pseudo-bulbs are small, and nearly round, bearing a single leaf; the flowers are borne upon a spike some 6 or 9 inches long; the sepals and petals are white, the lip rosy pink, streaked with yellow towards the base. In some of the varieties the sepals and petals are of the same colour as the lip. The flowers of *L. albida* are thick and fleshy, and last a long time in full beauty. This species may be grown successfully in a Wardian case, if suspended from the roof. It is a native of the cool parts of Mexico.

L. AUTUMNALIS is another kind which may be obtained at a

low price, thanks to the persevering collectors who have sent such quantities home. It succeeds best on a block of wood, although it is a more robust-growing kind than the last, and the flowers are proportionately larger, measuring between 3 and 4 inches in diameter. The sepals and petals are rosy purple, and the lip is the same colour, with a few white markings, and streaked with yellow towards the centre. It blooms in December and January, and produces a beautiful effect for several weeks. Native of Mexico.

L. FURFURACEA.—This is very similar in growth to *L. autumnalis*; the flowers, however, are very distinct, being both larger and different in colour, but it does not produce them with me

very freely. The sepals and petals are of a rich rosy purple, passing into dark purple in some varieties, and with a bright rose lip. The flowers are usually produced in autumn. It should be grown upon a block. Native of Mexico.

L. SUPERBIENS.—A superb species, and one that may be regarded as the giant amongst *Lælias*. The pseudo-bulbs are long, and support a pair of oblong-acute dark green leaves, from between which the flower spike is produced, and which extends upwards of 5 feet in length, and bears towards the top from twelve to twenty of its fine flowers, each of which is usually between 3 and 4 inches in diameter. The sepals and petals are bright rose suffused with red and reddish crimson; the lip is crimson streaked with yellow. It lasts in beauty during the greater portion of the winter months. It should be grown in a pot in the cool house. Native of Guatemala, &c.

L. PERRENI.—This should be grown in a pot, and be placed in a temperature a few degrees higher than any of those previously named. The pseudo-bulbs are slender, supporting a large, oblong, very dark green leaf. The flowers are produced from a spathe at the base of the leaves. The sepals and petals are somewhat narrow, in some varieties light, in others dark purple; the lip is contracted and rich crimson in front. It is a very handsome species, producing its flowers in autumn. Native of Brazil.—**EXPERTO CREDE.**

WORK FOR THE WEEK.

KITCHEN GARDEN.

It is now favourable weather for performing all necessary operations in this department. If the grass in any of the *Asparagus* beds is withering, and ground is scarce, cut it over if quite yellow, and plant a row or two of *Endive* and *Lettuce* for late work. Young *Cabbages* just through the ground should have a little soil thrown among their stems if intended to remain where sown. Plant the principal crop of spring *Cabbages* in well-manured ground. The East Ham is found to be a good variety for standing over the winter; it is not so prone to run to seed in spring as most sorts. Prick out into beds a few inches apart a large quantity of *Cabbage* plants which have just expanded their two first rough leaves; they will be required in spring. All *Herbs*, if not gathered, should be cut immediately. Quick drying is proved to be the best mode, for the same reason that quick bay-making exceeds a lingering process. *Sweet Basil* should be bunched and hung up in a hot kitchen, also *Sweet Marjoram*. When thoroughly dry let them be immediately packed closely in boxes, so as to exclude all air; indeed, bottled herbs sealed up after this treatment are very superior.

FRUIT GARDEN.

The summer fruit season being now nearly ended, attention must be paid to the gathering at a proper period, and storing away in a proper manner, the keeping winter stock. It is a somewhat nice point to know when to gather the respective fruits, some being best at one stage of the ripening process, and some at another. As a general rule, fruits of a precocious character, and which ripen rather hastily, and those also possessing some aroma, should be gathered somewhat under-ripe; while those which ripen with difficulty, which are long in gaining colour, and those which are scentless, should remain much longer on the trees. Certainly the way to obtain the greatest amount of flavour is to suffer fruit to become ripe on the tree, but I think that longer keeping is secured by gathering rather earlier. The colouring of the pip or seed is, perhaps, the most sure criterion; if it is one-half coloured it will seldom be wrong to gather the fruit. It need scarcely be observed that much care must be exercised in handling fruit for long keeping, especially the *Flemish Pears*. Some have advised them to be handled like eggs; the latter, however, will bear a much rougher handling than some *Pears*, many of which possess a fine skin, and are very susceptible of bruises. The *Pears* should only be placed one layer in thickness, if possible, and for material nothing is found better than cap paper, where the shelves are solid, placing the cap paper double. *Pears* require less ventilation than *Apples*; the latter are apt to give out a large amount of moisture when first placed in the room, especially if full of juice through rain. The *Pears* for long keeping may in such cases have something laid over them, in order to prevent excessive perspiration.

FLOWER GARDEN.

If previous directions have been attended to, the propaga-

tion of next year's bedding stock will by this time be well advanced, and where, from the pressure of work or other causes, this is not the case, every possible dispatch must be used while the weather is favourable. When cuttings of *Verbenas* and similar plants have yet to be put in, they should be inserted rather thinly in deep pans or shallow pots, in which they can be wintered, as they will be sooner established in this way than would be the case if they were potted-off before winter; and late cuttings managed in this way frequently winter quite as well as stronger plants, and unless plants are intended to furnish cuttings in spring, it is very immaterial how small bedding plants are before winter, provided they are well rooted, without having been raised in a close, warm atmosphere, to render them sappy and tender. Many through anxiety to secure large plants keep bedding-out stock close and moist until late in autumn, and frequently in frames on dung beds, where size is soon obtained, but plants treated in this way are necessarily so soft and tender that it is almost impossible to carry them over the winter without serious loss. Therefore, avoid keeping such plants too warm after this season, and if they are planted in bottom heat give air at night, and whenever it can be done, without the cuttings flagging, so as to prevent weakly growth. See to staking late *Asters*, *Phloxes*, &c., of tall growth, otherwise the autumn storms will destroy them prematurely. Choice *Hollyhocks* for seed should have the decaying corollas plucked out; this greatly helps the formation of seed. Make observations on the colour and general character of the flower garden before the season closes, in order to improve it next year. After studying the individual effect of flowers, let collective effect receive a consideration, as well as proportion, outline, and the combination of colours. *Anriculas*, if not already potted for the winter, should be potted without delay. Remove suckers or offsets, and place these round the sides of the pots, which should be 6 inches in diameter. *Anriculas* are impatient of rich compost during winter; turfy loam, river sand, and very rotten horse dung, will make a suitable compost, using only a small portion of the two latter. It is far better to give them a strong top-dressing in the spring, than to use soil of too strong and forcing a nature for their winter food. In consequence of the general weakness of *Tulip bulbs*, it will be advisable to put a small portion of decayed manure and leaf soil about 2 or 3 inches beneath the offsets. It is argued, and with some show of reason, that manure fouls the cups, but as there are exceptions to every rule, I would recommend a richer soil, at all events for the offsets, in the coming season. The *Carnation* and *Picotee* layers may be taken off and potted without delay, using the compost as directed last week. Many seedlings have missed blooming, and if not convenient to let them stand over the winter in their present situation in consequence of the large spaces in the beds from which the single ones have been removed, it will be advisable to prepare another bed of suitable compost, and carefully remove the seedlings with balls of soil, and plant them in regular rows. Here they may stand the winter, and will bloom profusely next season.

COLD PITS.

The sooner the potting of bulbs for forcing is accomplished the better, more especially imported bulbs. The chief aim should be to have the roots well established before growth commences, otherwise it is impossible to produce an early and a strong bloom. Most of the failures we meet with are chargeable to the omission of this most important point, and the fault has not unfrequently been charged, most unjustly, on the roots. A soil composed principally of a mellow loam with the addition of old cow manure and leaf soil, and a sprinkling of sharp sand and fine charcoal dust, will be found excellent material. Secure good drainage, and put the bulb high, three parts above the level of the rim, taking care that the soil is in a mellow state, neither wet nor dry. Shake the pot slightly in order to prevent the bulb settling too low, but do not by any means press the soil. They succeed by far the best in a cold frame, and it is most desirable that they should receive no moisture beyond that which the soil contains, until the pot is somewhat filled with roots. Those who have not a frame may plunge the pots in cinder ashes in some sheltered spot, taking care to raise them above the ground level for fear of water lodging. Be careful that there is a free passage for the rain, and let them be covered with 6 inches of some mellow material, such as old tan, old leaf soil, sawdust (if not too new), or ashes. This depth is necessary to keep out sharp frost. Bulbs put in water-glasses should be kept in a somewhat dark

place until pretty well rooted, suffering the bulbs to barely touch the water at first.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

The anticipated showers came greatly to our relief, freshening up everything out of doors. Parks and pastures are still rather brown, but lawns are in some cases quite green, and in others greenish yellow, with the green making headway. In some places the rain has commenced to fill the pools and ponds, and the water, dirty as it is, will be a great relief in many neighbourhoods, where even the household washing in working men's homes was becoming a serious matter, when every bucketful of water had to be daily paid for. All vegetables feel the genial influence of the showers and the cooler atmosphere. To make amends for the loss of Peas, *Scarlet Runners* and *Dwarf Kidney Beans* are exceedingly fine. Perhaps in the case of cottagers and amateurs, and many of the former read these pages, we had better modify a little what we said last week about pulling off all pods too forward for use, especially as respects the *Scarlet Runners*. A market gardener who largely supplies several towns in this district called the other day, and said that *Scarlet Runner Beans* must be scarce and expensive next season. He never had poorer crops; the extreme dryness had scorched up everything. Even *Scarlet Runners* were very poor, though generally they used to yield abundantly. All but the first early Cauliflower had been nowhere, and even now his winter vegetables looked miserable; the young Cabbages, too, were eaten up with caterpillars, and whole clouds of fly lodged in the hearts and destroyed the vitality of the plants. It will be well, therefore, for small growers who have healthy *Scarlet Runners*, to allow some of the oldest pods near the base to ripen their seed. We fear that in many cases the plants are too far gone, and so eaten up with red spider as to be of little avail, and in that case it is of little use retaining them where a row of good winter Greens could take their place. Owing partly to the stiff character of the ground, our *Scarlet Runners* were never better, being tall, and covered with pods. If these frosty mornings continue, we shall most likely suspend over them a rough straw band—that is, a band with a good deal of straw left outside of the band, so as to arrest free radiation upwards. By such means, even after frequent frosts, we have gathered in November. Where cottagers cannot save a few seeds, owing to the plants being too much exhausted, if the roots are still fresh and fleshy they might save themselves buying seed at a high price, by lifting the roots, and packing them in dry earth in any place where frost did not reach them. A good many would begin to push in April, and when planted out would produce rather earlier than plants raised from seed. Some also say that such roots yield more profusely than plants raised from seed; but we cannot say so from our own experience, having generally found plants from seed the most productive.

Caterpillars, Fly, and Slugs.—There are many complaints that, besides being smaller than usual, all the Cabbage and Broccoli tribes are eaten-up by these depredators. One gentleman told us the other day, that the leaves of his Broccoli and Cauliflower were quite riddled with holes, and that after much perseverance in picking off caterpillars. For several days we had a goodly company of white butterflies, which are so partial to depositing their eggs on the Cabbage tribe. When we had little boys in the garden we used to send them to hunt down the butterflies, which was as good as play to the boys at first. We did not adopt any such plan this year, and we have been troubled with scarcely any caterpillars as yet. The butterfly is rather a fine gentleman or lady, and is rather particular as to scent. We attribute our comparative freedom from insects to the scent from a little soot and half-burned charred refuse scattered over the ground on some parts of the garden; this we think, deterred the butterfly from alighting.

As a whole, we have never known a season in which so few slugs and snails were to be seen. The dryness taught them to keep down where they could find moisture. Now we see traces of them, though not at all plentiful. All the soft molluscs are deterred from crawling on rough surfaces, such as fresh-stirred ground, and more especially if a little rough ashes and lime are strewn over it. Fresh lime will kill them and worms when it reaches them, though sometimes a big snail will escape by quickly getting rid of its outside skin. They may be easily collected on handfuls of fresh brewers' grains, to which they are very partial, or beneath young Cabbage leaves slightly

heated and greased on the under side before laying them down, and going round with a lantern at night or early in the morning. There is a hard slug or snail with a yellowish-brown belly that nothing seems to kill. There is nothing for it but catching or trapping in some of the above ways. Fortunately it is fond of marching on hard substances, such as a firm, smooth gravel walk, and thus numbers may be picked up in a damp morning. Though injurious, we never found them so voracious as the softer common slug.

As yet grubs have not troubled us much this season. Perhaps we have had to replace a score of Cabbage plants, after finding the grub at the roots. All the slug tribe have as yet been scarce, though we hear they are plentiful in some places. We found to-day clusters of bluish fly in the hearts of the young fresh-planted Cabbages. We shall syringe them forcibly with clear lime and soot water. A little water will go a great way, and a double dose will generally settle them. A little soot and quicklime in powder scattered over them will do the same, but sometimes that is rather too much for young plants, and less or more it daubs up the leaves, and in bright weather is apt to scald them at times. The syringing with the caustic water is the cleanest mode, and does the young plants least harm. We have noticed a few Cauliflower plants with the heads just forming thus attacked with fly, and in their case we would use clear soot water, as drizzling or even fresh lime water might affect the colour, if not the tenderness of the head.

We tied up our earliest Celery, and ere long will earth-up the first bed, the tying having already commenced the blanching. We are much later than usual, owing to dryness and the scarcity of water; but as yet we see no sign of a plant bolting, which we attribute greatly to the shade given by green branches, &c.

FRUIT DEPARTMENT.

Flies and a few wasps make holes in the best fruit in the open air, but are pretty well excluded from that under glass by gauze netting over the openings. It is well, therefore, to commence gathering early Apples, Peaches, and Plums before they are dead ripe, and before they drop. They eat all the more juicy if gathered a short time before they are thoroughly ripe. All dropped fruit is less or more injured by falling. The best Plums, Peaches, and Nectarines that drop are good enough for cooking purpose, but a Plum for the dessert will look all the better with the stalk attached to the fruit, and the bloom uninjured. Even an Apple can scarcely fall without leaving a mark or bruise, which, if not seen before, is sure to be seen when peeled. We have several times gone over *Red Quarrendens* and *Kerry Pippins*, both good Apples in their way. A little practice enables the gatherer to pick the ripest as if by instinct. To keep the stalk to Plums a sharp knife or small scissors are necessary. The stalk is just as essential to completeness as the stalk is to the Melon. A fine fruit of the latter looks incomplete without it.

We gathered in the last days of August a few Peaches from the open wall. We fear we shall not be able to keep the fruit in the orchard houses so late as usual. With double glass roofs much might be done in the way of retarding, as the extreme heat would be kept out, and yet the light allowed to pass to give perfection in colouring. Owing to the heat and dryness our fruit are ripening faster than we wished them to do.

Strawberries.—The plants turned out of pots have yielded some good gatherings, but nothing to what they would have done in an ordinary season, or if we could have watered them freely. There are plenty of runners coming now. All the earliest-potted Strawberry plants, having pretty well filled the pots with a mass of roots, have received manure waterings, and lately each pot has received over the soil a pinch of soot held between the thumb and two fingers. It is best to err on the safe side, and not give too much, as two dressings are better than one large one. These will be washed down with frequent waterings for a month, and if by rain now and then all the better. The scent of the soot keeps many intruders away, and few manures are so successful in imparting a rich green to the foliage. Perfecting growth should be the main object this month, and ripening the buds the chief object at the end of September and the beginning of October. All runners from plants in pots have been cut off, as in such a case they are ex-hausters rather than feeders, and were we to allow them to act as feeders we should so far neutralise our object, as they would continue growth and promote luxuriance when we wish the early ripening of the plant, to make it fruitful early in the spring. Our object should be by healthy foliage first to secure a strong, well-shaped bud, and then to mature it early. With-

out this attention, huge plants in September and October may be less productive of fruit in March and April than plants of half their size but thoroughly matured.

Have our readers noticed that though last year Beech mast was abundant, there is very little to be found this season? On the other hand we never witnessed such crops of acorns, hips, haws, horse chestnuts, &c. These are generally regarded as the signs of a severe winter. We do not contemplate any scarcity of food, but we fear in many country districts there will be a great scarcity of the means of procuring it, owing to the scarcity of employment, &c., the ensuing winter, partly owing to the shortness of straw, and chiefly to the general failure of the Turnip crop, as good fields are too much the exception. Food, though cheap, may be very scarce if there be little or no wages forthcoming to purchase it. If in such a season some of our chemical coadjutors could hit on a simple plan for removing the astringency from chestnuts and acorns, they would confer a public advantage. Fowls, pheasants, pigs, deer, &c., thrive well on acorns, notwithstanding the astringency. People in time may become used to anything. The other day we saw a man with a branch of Sloes well loaded with fruit, and he was eating them with as great avidity as most of our readers would have partaken of the finest Gooseberries.

ORNAMENTAL DEPARTMENT.

We have had several sharp hoar frosts in the last week of August, much earlier than we have been in the habit of witnessing. Owing to comparative dryness these did little harm. After a heavy shower in the evening of the 2nd inst. the sky became very bright, and the frost early in the morning told more owing to the flowering plants in beds being wet. A second time our Coleus beds were browned a little, but not so much as they were by the one day of excessive heat. A number of leaves of Perilla were also slightly browned, and a few flowers of gorgeous masses of different-coloured Geraniums had their petals a little bleached. Broad-petalled blooms, as Rubens and Donald Beaton, suffered more than the smaller-petalled Nosegays. What struck us as a little singular is, that the lighter flowers, as Rubens, suffered more than dark ones of the Tom Thumb and Punch varieties. Towards the afternoon the traces of the bleaching by frost were nearly gone. Five lines of Iresine Herbstii were not in the least touched. We have as yet no break in the general gorgeousness, with the exception of some beds of Verbenas, that all at once almost entirely stopped blooming owing to the dryness. We hope they will come on again after the showers, as they form part of a group where their colour is required to make the composition complete. Similar beds rather disappointed us in the autumn last year. If we had the prospect of a like scarcity of water we should be inclined to do without Verbenas in beds forming part of a group. The mulching did not save them from the drought, as we believe it saved the moisture-loving Calceolarias. No such precautions need be considered by those who can apply water as needed.

Picking faded flowers and petals from beds is a matter of great importance, especially in showery autumns. Wishing to have everything neat, this work has taken up much time. It is not only that these faded blooms look badly when dry, and most wretched when wet, but every shower, if at all continuous, is apt to send the dirty colour of the exhausted flowers over the blooms and leaves that are still perfect, thus greatly disfiguring them. Our beds have needed little picking this year, the blooms having stood so well, and the showers having been so gentle as not to disturb them. A number of the oldest required removing so as to give room to the younger and fresher blooms. A correspondent has told us that in his, and some neighbouring places, the foliage of the varieties of Scarlet Geraniums, kept getting yellow and dying off. We have had nothing of the sort here as yet, with all the dryness and scarcity of water. We never saw the foliage better, and we like to see good growth as well as plenty of bloom.

Took the opportunity of the showers to well roll the walks and lawns. This will help to keep them smooth and firm for the season. When a lawn is well rolled, it is comparatively easy to keep it neat, either with the machine or scythe. We lately saw a young lady working a 12-inch machine, and she did it with as much gracefulness as if she were handling a croquet mallet.

Proceeded with potting Cinerarias, Primulas, Geraniums, Ferns, and stove plants; with re-arranging corridors, the conservatory, &c.; and with propagating for next summer, as lately more fully detailed.

Comparing Notes.—There has been great diversity of opinion expressed as to the Golden Feverfew. We have been both disappointed and delighted with it. We believe the secret of being delighted consists chiefly in using young seedlings instead of cuttings or older plants left or divided. We have used it round Coleus, and as the plants were from cuttings and old plants divided, they have disappointed us, as they have not grown so strongly and regularly as we wished. We have edged a group of six beds round a centre, which was edged with white-leaved Cineraria. The six beds are in pairs, though crossed alike, and these, though the season has been dry, form a fine edging about 7 inches wide, of a rich soft greenish yellow. The plants were raised from seed sown in March under glass, pricked out first, and then planted out when small. We may have to take cuttings, but in our opinion they are not to be compared to seedlings for regular vigorous growth. These six beds have each inside of the Feverfew a blue ring of a dwarf blue Lobelia. One pair of beds particularly pleases us by their soft beauty. These are edged and ringed as stated, then the beds are filled with Mangles's Variegated Geranium, and that is again mixed with the light blue free-growing Lobelia gracilis. This small blue mingling with small pink flowers, and carpeted with the variegated leaves, and edged as stated, is to our eye very beautiful. The soft greenish yellow edging made all complete.—R. F.

TRADE CATALOGUES RECEIVED.

- James Carter & Co., 237 and 238, High Holborn, London, W.C.—*List of Dutch Bulbs, Fruit Trees, Roses, &c., for 1870.*
 B. S. Williams, Victoria and Paradise Nurseries, Upper Holloway, London, N.—*General Bulb Catalogue, Catalogue of Fruit Trees, Roses, &c.*

TO CORRESPONDENTS.

* * * We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely to The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

DRYING FLOWERS (Miss Ashton).—But few flowers retain their full colour when dried. To retain it as far as possible place them between folds of blotting paper, press very gently, and change the blotting paper for fresh every morning and evening.

WHITE EXCRESCENCE ON BEECH TREE (Stafford).—It is a parasitic fungus, and all such parasites are injurious in some degree. Scrape it off, and paint the trunk and branches with a mixture of clay and sulphur in water.

FOUNTAIN (A. Robinson).—That figured was executed in America, but many of our English fountains could supply one similar.

ALANTHUS GLANDULOSA (F. D.).—So far from being rare it is one of the commonest of trees. Seedlings two years old may be bought by the hundred at about 1½d. a-piece, and plants from 1 to 2 feet high for about 4s. per dozen. We answered your question last week.

STOVE-HEATING A SMALL GREENHOUSE (R. A.).—An iron stove 12 to 14 inches square would be ample to suit your purpose. So many makers advertise stoves lined with fire-brick, that we cannot with impartiality recommend one. If there is any difficulty in your neighbourhood, buy a stove 1 foot square, and a fire-box 8 inches square to stand in the middle. (H. B.)—Nothing will be so good for your little house as a small iron stove with the pipe through the roof. If you can use gas, a small gas stove either of iron or terra cotta would do, a small gas-pipe from the top into the open air being provided.

REMOVING PINE-APPLE SUCKERS (A Constant Reader).—The true Ripley Queen Pine Apple has a broad pip. A number of suckers will take strength from the fruit. We would have removed a number of yours earlier. If the fruit is swelling it would do as much harm as good to remove the suckers now. When the fruit is cut we would earth them up and take four fruit from a stool.

ROSES ON THE MANETTI STOCK (Seyhor).—Manetti stocks are propagated from cuttings about 10 inches long, of firm wood, leaving a couple of leaves. The cuttings should be inserted in the earth now. They should be planted about 5 inches deep, and be trodden in firmly. The distances at the Dorset Nurseries, Blandford, are 6 inches from plant to plant, and 18 inches or 2 feet from row to row. It is not too late to bud Roses on the Manetti stock. If the slice will peel, and the stock run, you will succeed. Do not land on the wood of this year, but on the main stock. Bud as low as you can. Scrape away the earth, as the covered bark of the stock will often run, when the exposed part will not do so. Now with regard to the 13½ feet of sloping bank 6 feet in width, with a 15-inch wall, I should plant against the wall those noble yellow Roses on

short stocks, so as to utilise the wall—namely, Gloire de Dijon, Maréchal Niel, Cline Forester, Triomphe de Reunes, Solfaterre, and Lamarque. I should allow each Rose ample room to ramble in single file, espalier fashion—that is, a single branch on each side of the stock. As you have some good Briar Roses, I should use them, by planting them at the top of the slope 6 feet apart, and the Manetti-stocked Roses 3 feet apart each way, planting the strongest growers next in rank to the standards, and the dwarfier plants lowest. I do not understand whether the wall is at the top of the slope or at the bottom, but in any case I should use it for the Tea-scented yellow Noisettes, which are, for beauty and performance, the best in the Rose kingdom. My garden now groans with these fine yellow Roses. Lamarque and Solfaterre are not here, I regret to say. As to the description of Roses, there can be no question that Hybrid Perpetuals, with Baron Gonsella, Marguerite Bounet, and Souvenir de Malmaison, Bourbons, and beautiful Mrs. Bosquet, China, are the best to have. In my opinion, Teas, Tea-scented yellow Noisettes, and Hybrid Perpetuals, are the Roses to have. If you wish variegated Roses, you must have summer Roses—namely, (Gillet Parfait, Tricolore de Flandre, Madeline, called also Emmeline, and Double-margined Hipp. They are all beautiful. The first is tender, but the best; and the other two are vigorous and hardy.—W. F. KADLYFFE.

BURNING SULPHUR TO DESTROY RED SPIDER (E. H.).—If you had consulted the repeated statements made in our pages you would never have burned sulphur in your vinery to get rid of red spider or anything else. Burning sulphur in a confined place is likely to kill everything that is green. It makes little or no impression on well-ripened hard wood of deciduous trees when the leaves are gone; but even if the leaves are fallen it will injure wood that is not well ripened. Sulphur fumes, so distasteful to red spider and other insects, cannot be safely liberated at a temperature higher than from 100 to 170° among growing plants. We are not surprised that the foliage and Grapes have suffered. If, as you say, the wood was ripening at the base, we should not be so much afraid of next year's crop, more especially if you encourage some offset shoots with young leaves on them, to maintain the root-action, reducing first and then removing them in the autumn. This will help to remedy the great error.

LILIUM LANCEFOLIUM REBREM AFTER FLOWERING (R. H. F.).—Let the soil be kept moist, but by no means give so much water as when the plants are growing and flowering, and when the stalks decay turn the plants out of the pots and remove the old loose soil, but no more than can be done without injury to the roots; remove the small offsets and repot, using a compost of two parts turfy loam, one part peat, and one part of old cow dung or leaf soil, with a free admixture of sand. Drain the pots, and pot low enough to afford room for a top-dressing of rich compost in spring. If the crowns of the bulbs are just covered with soil at the potting that is sufficient. Set the pots in a cool house, and keep the soil moderately moist. They will winter safely in a cold pit or orchard house, the pots being plunged so as to protect the roots from frost.

SELECTING VEGETABLES AND FRUIT FOR EXHIBITION (Tadn.).—Of the Vegetables you mention—viz., Potatoes, Peas, Runner Beans, Celery, Cabbages, Cauliflowers, Carrots, Turnips, Maize, and Globe Artichokes, we should select the first eight as being the most useful, and to such the prize should be given rather than to novelty, the specimens being well cultivated. Peaches, Pears, Plums, Apples, and Melons would, we consider, be a better collection of five fruits (Pines and Grapes being excluded), than your showing Nectarines in place of the Plums; but you must look closely to the wording of the schedule, for we think the prize will be offered for five out-door fruit, and in that case you must exclude the Melon, and show Nectarines instead. Show a Melon if you can without infringing the rules.

SPIDEA JAPONICA AND S. PALMATA TREATMENT (Glasscutter).—The best way to grow them is to plant them out in an open situation, and in a soil well drained and enriched with cow dung or leaf soil. If the situation be shaded from the direct midday sun all the better. Water freely when growing and flowering. The Meadow Sweets delight in a moist soil. If you wish to grow the plants in pots, plunge them now in a situation such as we have described, and let them remain until November, when you may place them on a shelf in a light airy greenhouse. The plants will flower early in spring, and are among the finest of forced plants. After flowering continue them under glass for a time, and then plant them out in the open ground. In autumn take them up, pot them, and place them in a cold frame until required for forcing, or in the greenhouse, where they will come on more slowly than in a forcing house, but will flower as well if not better. They are hardy herbaceous plants and ought to be in every garden. If left in the open ground give a mulching of leaf soil to the plants every autumn, when the foliage decays, and before severe weather sets in.

VINERY BUILDING OVER A VINE (Inquirer).—We have no doubt that raising a light house against your warm Vine wall would be of great service, even though you put it up in March and remove it in October. As you use no artificial heat the Vine would not suffer in winter, for you protect the roots. All moveable houses are expensive—that is, if made in sashes, and not merely glazed in grooves to be easily removed. The cheapest houses are fixtures, with large squares and strong sash bars instead of rafters. In such a case, without any fire in winter, there is little danger of glass breaking if not glazed too tightly, and such a cold house is useful for many things in winter.

SUPERIOR HELIOTROPES (Hatfield).—For "prettiness of flower, compactness of habit, and constitution," Beauty of the Boudoir; but if you want one for winter-flowering, Monsieur Hamatre is excellent.

TAKING UP GLADIOLUS BULBS AND POTTING (Idem).—There is no doubt that many of the evils which beset this splendid flower are due to the drying the bulbs during the season of rest. We do not think it wise to take up the bulbs, dry them to the extent they frequently are, and then plant in wet soil. We like your plan best—namely, taking up the bulbs soon after ripening, potting them, plunging and covering them in ashes, and then setting them on shelves in a cold house. There is but one objection, and that is, unless you can ward off heavy rains the soil is rendered too wet to be of benefit to the plants, but that can be guarded against by a waterproof covering during wet weather. The situation selected for plunging should be dry and well drained. With us the Gladiolus grows and blooms finely in the shrubbery borders, and with no more care than the shrubs and other plants, weeds being kept down, and the surface occasionally stirred. It is not nearly so tender as many suppose.

HEATING A PIT (E. W. F.).—Sometime ago Mr. Fish described how to make the most of such a pit as yours, 5 feet high in front, 7 feet high at back, and 5½ feet in width, with a pathway along the back, and a brick-on-bed wall to separate the path from the bed. In his case the pit was sunk below the ground level nearly 3 feet, a matter of importance so far as heating was concerned, as 3-inch pipes would be about as effectual as 4-inch pipes if the walls were exposed to the atmosphere. With the mode of giving air in front and also at the back we are satisfied, only for early forcing it would have been as well if the ventilators had been lower down, so that the air given in front should go over the pipes before passing into the house. Now, we have repeatedly stated that the cheapest mode of heating such a pit or house for propagating Cucumbers, Melons, &c., would be to take a strong tube made of brick-on-bed, and strong covering through the chamber & under the bed, and having openings into the passage to let up top heat. We could command any amount of moisture from such a tube by giving plenty of moisture round it, not on it. Hot water, however, is more easily managed and requires less care. For winter Cucumbers in such a house, you would require two 4-inch pipes for bottom heat in the chamber & two for top heat near the ventilators in front. If you were satisfied with spring forcing, 3-inch pipes would do. The price of the pipes would be proportional, the larger ones about 2s. 6d. a-yard, with more for elbows and turns. A small saddle-back or conical boiler costing from £3 to £4 would suit your purpose. We decline to recommend tradesmen, as we believe all who advertise in our columns are to be trusted, and that disappointments and misconceptions are more owing to the whims and changes of opinions of the employer, than to any wish to take advantage in the case of the employed. Hence, when a plan is adopted and a fair estimate given, it is to the benefit of all parties to adhere to the plan and keep out all extras, which, in general, are anything but an advantage to either party. Now, to some of the specific questions:—First, if you are resolved to have a chamber beneath your bed, with pipes for bottom heat, then strong slate will be the best covering, the pipes running through the chamber and having the means of giving bottom heat and top heat as you like, by having the top of the boiler lower than the lowest pipe in the chamber. If you resolve on such a chamber, it will be all the better to have a few slits from the passage at the bottom of the chamber to admit air, as you want of this is a fertile source of the pipes for bottom heat not acting. Above the slate you should have at least a 2-foot space for drainage and soil, say from 4 to 6 inches of the former, which should consist of rough rubble. We would have upright drain-pipes in each light, and by pouring down water among the rubble we could have moist bottom heat, and moist top heat at will. The latter could be also obtained by evaporating-pans placed on the top pipes. Whatever space you leave between the earth-bed and the trellis for the Cucumbers, the trellis should be at least 15 inches from the glass. We have no fault to find with heated chambers provided with the air-slits before referred to; but we would never think of one in such a pit as yours. Having fixed on the position of our pipes, by taking into account the trellis, depth of soil, and depth of covering of pipes, we would concrete and roughly cement the bottom of the smaller enclosed pit for soil. On that we would place our pipes, and pack between them and over them as closely as possible to the depth of 4 inches, with brick-bats, clinkers, stones, flints, &c., finishing at the top with a layer of clean-washed gravel stones, say from 5 and not more than 6 inches from the pipes. On this place the soil, which can always be removed easily without at all disarranging the covering. A common drain-tile set upwards in the back or front of the pit, the bottom and just a little above the concrete will enable you to give a moist bottom heat at will; we have had such in use many years, and never found anything cheaper or better. When we renew our beds, we brush the soil as clean as possible out from the small clean gravel. We think this mode rather more effectual and far cheaper than chambering for all narrow pits. One question remains—"Would it add much to the expense to have the pit divided, and the heating apparatus so arranged as to heat one or both halves as desired?" Yes, it would add to the expense. The cheapest mode of heating such a 24-foot pit would be to place the boiler at one end, and let the bottom and top heat go right through. We have done so with some pits much larger than yours, and we divide each pit as we like with moveable wooden partitions, easily lifted out and in, and we keep a high temperature and a comparatively low one, merely by giving a little or abundance of air. There is always much expense connected with valves, &c. The cheapest way you could regulate your pit, so as to have one half well heated, and the other heated only a little, or none at all, would be to place the boiler in the centre, take the flow-pipe to a receiving-box, and to that have two pipes for a flow both ways, one of which you could wholly or partially plug up as you like. You would thus escape the expense and trouble of valves, which are very good in their way, but the best of them are apt to go wrong.

LAWN WEEDY (T. H. T.).—We should weed the lawn at once, cutting up the weeds by the roots—that is, as far down as you can, removing as much of the root as possible, and this we would continue to do all the autumn, and early in March we would well rake the lawn with an iron rake, and then apply to it a good dressing of very rotten manure; early in April we would rake it well, sow some grass seeds, and roll well.

MRS. POLLOCK GERANIUM NOT THRIVING (Idem).—Your plants are probably in a dry situation and are suffering from that. We should pot them at once in a rich turfy loam, and place them in a light airy part of the greenhouse, where, we have no doubt, they will recover.

TREATMENT OF BAMBOO AFTER GROWTH (Idem).—We should leave the plant entire, and in spring after growth commences we would cut away all the injured and dead parts. Mulch round the plant in winter with decayed leaves. The leaf and flower sent us appear to belong to some herbaceous Phlox. If so, the plant should be grown in an open situation in good, light, loamy soil. The Willow must have had its stem or roots injured, the bark probably gnawed off the stem, perhaps by water rats.

WIRING A FRUIT WALL (X. Sibmuth).—The most suitable wire is that known as No. 10. For Peach, Plum, and similar fruit trees the wires should be 6 inches apart. For the Peach and Apricot we like them in every course of brick, or 3½ inches apart; but for Apples and Pears 10 inches will be a good distance. The Morello Cherry requires them the same distance as the Apricot. We have our wires 3½ inches apart, and make that do for all kinds of fruit trees. They ought not to be more than three-quarters of an inch from the wall, the nearer the better. The directing eyes may be 6 feet apart, but we prefer them half that, or as near as we can get them to suit the openings in the wall for driving

them in. You will need a piece of iron at one end to fasten the wires to and at the other end you will need a similar piece with holes at the proper distances, through which bolts can pass, and by means of those you can tighten the wires like a fiddle string. The screws are kept by every ironmonger, or he will procure them for you, and all that is necessary for fixing. The wires should be stretched in a horizontal direction; it is the cheapest and best plan.

VIOLA CORNUTA DYING (*J. F. C.*).—We think the plants are old and exhausted by early flowering, and the heat and drought of the past summer. We advise you to take up the whole, raise fresh plants from cuttings or seed, and plant afresh after digging the ground well and working in a liberal quantity of manure or leaf soil. Trees, by keeping the ground dry and exhausting it with their roots, would be injurious. Had you given the ground a few good soakings of water, and a top-dressing of short manure, which the foliage would have hidden, we think all would have been right.

NECTARINES WITHERING BEFORE RIPENING (*Idem*).—The tree has most likely been too dry at the roots, and the fruit has consequently shrivelled; or it may have been infested with red spider. We think more copious supplies of water and mulching over the roots would have prevented the mishap.

FILLING AND MANAGING A FERN CASE (*T. J. H.*).—In an early number we shall treat of the subject fully.

GLOXINIAS AFTER BLOWING (*E. H.*).—After flowering the plants ought to have a position near the glass, in a house with a temperature of from 50° to 55° at night until the growth is matured, as it will be when the leaves and stems are withered. Give no water from the present time until the leaves show signs of flagging, then give a moderate supply; continue this treatment until October, then withhold water altogether, but set the pots on a floor whence a moisture will pass to the soil but not to the extent of making it wet. The tubers winter all the better if kept rather moist, for when kept just-dry through the winter they are apt to become farinaceous, and decay when moistened in the spring. In winter they will be safe if kept in a house with a temperature of 45°.

PLANTS FOR WINTER AND EARLY SPRING FLOWERING (*Idem*).—We have the following in our greenhouse, and they flower at the time you wish:—*Acaecia armata*, *Drummondii*, *grandis*, *oleifolia elegans*, and *longiora* magnificæ, the last two in our opinion the best of all the *Acaecias*; *Benaria splendens*, *Bornia Drummondii*, *Bouvardia Humboldtii*, *B. Leicantia compacta*, *Coronilla plena*; *Correns Brillant*, *Harris*, and *speciosa major*; *Cyclamen persicum*, *Cypripedium venustum*, *Cytisus Atleamus* and *racemosus*, *Lacunia gratissima*, *Magnolia lutea*, *Monachatum ensiferum*, *Primulas*, *Camelias*, *Viols*; *Euphorbia Hyacinthiflora*, *Lady Alice Peel*, *Lady Penance*, *Rubella*, *The Bride*, and *Viscountess Hill*; and *Erica colorata*, *melanthera*, *hyemalis*, and *autumnalis*. The forcing house will give you *Azaleas*, and a variety of hardy shrubs and plants, as *Lilacs*, *Double-flowering Peaches*, *Cherry*, and *Plum*, *Prunus sinensis flore-plena*, *Dentzia gracilis*, *Roses*, *Dicentra spectabilis*, *Spirea japonica*, *Lily of the Valley*, and *Bulbs of Hyacinths*, *Narcissus*, *Tulips*, and *Crocuses*.

MILDEW ON ROSES (*Idem*).—Soot is a good remedy, but not always a cure for mildew. We have not found anything better than frequent forcible syringing of the trees overhead, and to keep the roots well supplied with water, and dust the parts infested with flowers of sulphur whilst the leaves are wet. An old stocking is as good as anything for distributing the sulphur.

PLANTING STRAWBERRIES (*M. G.*).—The best time to plant Strawberries is in summer, as good well-rooted runners as can be secured. The rooting ought to be facilitated by laying them and taking off the runners or string beyond. Well trench and manure the ground, mixing the manure with the soil. Plant the Strawberries in rows 2 feet apart and 1 foot from each other in the row. After they have fruited once take out every alternate plant, so that they will be 2 feet apart every way. Water well after planting, and during dry weather.

ANNUALS FOR PRESENT SOWING (*Idem*).—*Candytuft*, crimson, lilac, and white; *Clarkia pulchella* and *Clarkia pulchella alba*, *Collinsia bicolor* and *grandiflora*, *Erysimum Peroffskianum*, *Eschscholtzia californica*, *Limnanthes Douglasii*, *Lupinus nanus*, *Nemophila insignis*, *Saponaria calabrica*, *Silene pendula* and *alba*, and *Virginian Stock*, red and white.

ASHLEAF KIDNEY POTATOES FOR SEED (*Idem*).—Take them no if you have not already done so, and place them in a dry shed, if on shelves all the better, so that they may have air all round. When they are thoroughly dried place them in a cool dry cellar or other place secure from frost, but the colder the better, so long as they are safe from frost.

HYACINTHS AND TULIPS FOR PLANTING IN A ROSE BORDER (*H. C.*).—We think you will only be disappointed if you plant Hyacinths and Tulips in the same border for simultaneous blooming. We should confine ourselves to one of the two, having a line of red, white, and blue Hyacinths, placing the blue next the walk, the red at the back, and the white between the two. We have no doubt that they would have a pretty effect if a double line of each were planted with bulbs 9 inches apart, and the rows half that distance from each other. If you had Tulips which would flower later we would advise a line of *Bien C-este*, then *La Candeur*, and *Tournefort* at the back. But why have either of those? the *Roses* are sufficiently beautiful without them. We like to grow one thing well, and if we had our choice would have *Roses* only on the same ground. Besides, to do the *Roses* justice they ought to have a good mulching of manure in autumn, and it ought to remain over the winter, removing the loose manure in spring, and pointing the rest in with a fork.

ALFRED COLUMB ROSE (*Idem*).—It is more vigorous on the Manetti stock than on the Brier, though on the latter it does well when the soil is a strong loam. It requires plenty of manure, and abundant watering and mulching in dry weather. It is a splendid Rose.

LIQUID MANURE (*A Constant Reader*).—The stable, cowhouse, and other sewage without diluting with water may be put on to the soil previous to digging for any kitchen-garden crop, and so it may to Asparagus and Rhubarb whilst growing. For flowering plants it should be diluted with at least five times its bulk of water.

GRUBS (*John Knight*).—The grubs eating off your Cabbage plants just below the surface are the larvae of the Daddy-longlegs (*Tipula*). Try taking up the plants and replanting with their roots only just below the surface. It has been stated that it is only the soft succulent collar of the plant that the grubs can bite; the woody part is too hard for them.

NAMES OF PLANTS (*J. T. Sinclair*).—*Senecio saracenicus*; *Stenactis speciosa*; *Atriplex patula*. (*A Fern-grower*).—1, *Scolopendrium vulgare*; 2, *Pteris longifolia*; 3, *Pteris tremula*; 4, Probably *Nephrolepis exaltata*; 5, *Cystopteris fragilis*; 6, *Asplenium farcatum*. (*Lichard Jameson, Gargrave*).—It is a Moss, *Dryum nodulatum*. (*Somerset*).—1, *Euonymus japonicus aureo-variegatus*; 2, We do not undertake to name florists' flowers; 3, *Senecio elegans purpurea flore-plena*. Give the *Euonymus* greenhouse-treatment. (*G. P.*).—1, *Adiantum athiopicum* (A. assimile); 2, A. *capillus-Veneris*, deeply cut variety. (*M. B.*).—*Nephrolepis tuberosa*; *Pteris*, apparently *P. quadriaurita*. We do not recognise the *Adiantum*, which appears much too large in the pinnae to be referred to *capillus-Veneris*, which otherwise it much resembles. (*Collingham, R. W.*).—2, *Nephrolepis tuberosa*; 3, *Doodia lunulata*.

POULTRY, BEE, AND PIGEON CHRONICLE.

POULTRY AND BIRDS.

It appears to me that I must say a word on behalf of farmers' wives who have to keep poultry as a source of profit, and who sometimes get considerably snubbed by their husbands, who grudge the destruction of a few rods of corn or clover, and who evidently don't reason on the matter, and don't or won't understand either the habits or the profits of poultry.

A farmer will readily turn a large flock of sheep to trample on and drag down a fine field of clover or grass, but he would be much annoyed to see half an acre eaten by his wife's poultry. He will give his pigs barley and beans by the sack, but objects to the poultry helping themselves to their kernels. By-and-by I will tell him which pay best for their food, for I am sure he has never entered into the question. Let us now consider the habits of poultry. Take my own as an instance, for some three hundred of them have free access to all my fields (no fences to obstruct them) from the early morn to dewy eve.

As soon as the fowl-house door is opened they receive their morning meal of barley; they then at once betake themselves to the fields—for what? Observe them. That wonderful eye of theirs examines everywhere, and, quick as thought, they appropriate every fly, slug, worm, or insect on every blade of grass or clover. This is their occupation during the whole day, except when at rest or when grazing.—for poultry graze equally as do sheep or cattle,—and it is essential that a piece of pasture should be near the fowl-house, otherwise they will, and must, appropriate your young cabbage, turnip, or mangold plants. They must also have free access to water.

What a mistake we make when we cage up poultry, and deprive them of their natural food—green food and insects, with some grain. They are first-class judges of weather. They know by instinct (where does instinct end and reason begin?) when and where their food—insects, worms, &c., is to be most readily found. They watch for every load of green tares or green beans brought home to be passed through the chaff-cutter, and they at once set to work upon the myriads of insects that infest almost every crop.

They are the most industrious and economical of creatures—their ready claw and keen eye are ever at work—not a seed of weeds or grass is wasted. In fact, fowls and birds are true farmer's friends, and the farmer can have no idea how many enemies he has (invisible ones to him) in the shape of insects until he devotes his attention to the operations of his poultry. Although he can neither see his enemies nor know of their whereabouts, the fowls and birds at once detect them, as you may see by their eager darts and rapid movements hither and thither.

Watch a company of Ducks toddling along in regular line, for fair play, and they will show you slugs and insects where you never suspected them. In fact, within a week of leaving the shell the juveniles are on the alert for their natural food, the insect tribe. I could write a small volume on the value of birds, for it is only by watching their habits and good work that the farmer can realise how many enemies he has, and how many friends there are ready to seek for and destroy these enemies.

It is a well-admitted fact by all my labourers that my best and thickest crops are in immediate proximity to the fowl-house, commencing at only 10 yards distance. Yes, but see how they are scratching up the seed corn, and what a mess they make. Well, I have seen them at work between the rows of young wheat (and I only put in a bushel per acre at 9 inches from row to row), and I find in nine cases out of ten that they are in search of insects, and that they do find them. Gardeners who are sensitively particular about the appearance of their gardens, and hate fowls, see, however, what takes place:—An intelligent chemist took to a garden where insects had long and

undisturbed away, and devoured everything. He was fond of poultry, and understood their habits, therefore he gave them free access to his garden; they cleared off the enemy, and he had plenty of everything. No doubt there are times when you would protect your fruit, or your shallow-sown seeds. In my case I sometimes employ a boy for a fortnight immediately after drilling close to the poultry-house, but even when I have not done so, I have scarcely been inconvenienced if the grain was properly deposited by the drill. The hen-coops and broods of chickens are always placed on a patch of grass edging the wheat or barley fields; and if, when the crops are ripe, they help themselves to a few sheaves, I know they are good customers for they must be fed like sheep, or pigs, or cattle; and they always sell for double the price per pound, although they cost less to produce. Partridges are great friends to farmers, although they don't always believe it. There is no surer sign of imperfect tillage than when you hear of birds and game getting out the seed. What I call imperfect tillage is ploughing the land and then merely scratching the surface with light wooden harrows, so that the seeds are close to the surface, and under them are unbroken furrow slices—long, hard lumps of undivided and unbroken earth, in the case of strong soils almost as tough and impenetrable as weather boarding. In my case I always use heavy iron harrows and deep steeled teeth that cut the furrow-slices into mould, or sometimes entwine with the cultivator barrow before drilling, and generally the surface has been well aerified before ploughing, so that the seed is not only properly deposited, but where it grows the young fibres find mould below to work in.

For want of this proper tillage I have seen great losses; the fine fibres cannot work into the great lumps of undivided plough slices which, in stiff clays, are nearly as hard and as whole as weather board. I don't believe that one farmer in ten can tell me what price per pound, live weight, he gets for his poultry, and for his beef and mutton, but I will tell him;—5s. per stone of 8 lbs. is 4½d. per lb. live weight of beef, and nearly about the same for mutton. Now as good poultry always sell for at least 9d. per lb. live weight (I mean wholesale), and as they cost no more per pound to produce than beef or mutton, it follows that we gain one hundred per cent. by poultry, as compared with meat. I have tested this carefully. In fact I know that the difference is greater than this, because I have frequently sold poultry at 14d. and 16d. per lb. live weight, or more than three times the price of meat. When we sell a chicken, the purchaser pays for head, skin, feet, entrails, and all but feathers (which sell for more than the carcase per pound), but when they buy meat, the feet, skin, blood, entrails, &c., are all removed, and called offal; consequently, it requires no conjuror to convince heads of families that poultry is dearer food by one hundred per cent. than meat.

But should poultry be so dear? I answer, Decidedly not, if we, as farmers, did our duty to ourselves, our land, and our country. The demand is evidently in excess of the supply for both poultry and eggs, for we import immense quantities, and, in addition, 500,000,000 of eggs annually! In a former paper I gave you comparative trials of the consumption of barley by a hen and a pig, much in favour of the hen. Of course, your poultry-breeder must understand the business, as must the breeder of other farm creatures. The edge of the fields is the proper place for juveniles, and not cooped up in yards and sheds. Mine are not fancy poultry. I breed from pure stock on each side, say Game, Cochon-China, and Brahma Pootra, all running and mixing together. I like Dorkings, but they won't thrive on our stiff clays. Every two or three years I change the male birds, paying 21s. each for young well-bred ones. We send them to the wholesale salesmen in London, ready plucked.

The hen-houses should have asphalted floors, be kept clean, well-ventilated, and occasionally lime-washed; the slated roof lime-washed in hot weather.

A farmer never grudges barley by the load for his pigs, and cake and corn for his other stock; why should he regret feeding his poultry? We should consider that poultry manure the land the same as any farm animal.

As we are doing away with our trees and fences, there should be plantations on every farm for birds to build in; and we should have plenty of poultry and Partridges—the latter for the farmer's table, if not for his sport. It is well known that many a farmer's wife clothes herself and her numerous family by the proceeds of her poultry. In some cases that I know of one of the farm hands receives a pint of beer when the governor is at market to carry in a sack of barley on the sly for the

nse of the poultry, so as not to shock the farmer's excessive and unreasonable prejudice about the unprofitableness of poultry.

The hen-house floors being asphalted, and swept daily, and having no open farmyard, knee deep in straw, we know nothing about fleas.—J. J. MECH, *Tiptree* (in *Essex Gazette*.)

WAKEFIELD POULTRY SHOW.

TURNER'S pens were used for the feathered stock, placed in two rows on platforms erected for the purpose. Unfortunately a mistake which is of daily occurrence seemed, to some extent, to mar the regular course of events, though we strongly suspect that none but the exhibitors themselves are to blame, a large number of pens of both poultry and Pigeons arriving too late for competition, although the arbitrations were considerably protracted, so as to allow late arrivals a chance.

Game in all classes were moderate in quality, and the pen to which the cup was awarded, fine close-feathered Black Reds. In Game *Dantams* were three classes, and the cup awarded to Black Reds, and in the Variety class the whole of the prizes went to Puckwings. The Black and White were but a poor lot, but there were two pens of Golden-faced of high quality. There were five classes for *Hamburgs*; most of the birds were very fine, and the cup won by a grand pair of Silver-spangles. The *Syriish* were very good; in fact, the first-prize pair were the most promising we have seen this year. The *Dorkings* were large and forward; but the most handsome pen in the large varieties was a pair of Buff *Cochin* chickens, to which the cup for the best section was given. *Jubaults* were a nice display, and the birds in fine feather. The first-prize *Aylesbury Ducks* were not the largest, and won by the great beauty of beak and plumage. In *Renens* the second-prize birds were in full plumage, but the first much larger and correct in marking. The Grey Toulouse *Geese* in the first-prize pen were fit representatives of a Yorkshire farmstead, the girth being more like that of a well-fed pig than a fowl. The rest were Whites of gigantic frame. In the Selling class Spanish were first, Cochins second, and Game third.

The *Pigeon* classes were well filled, the quality being also very fine. Mr. Filton won first in Carriers with a good pair of Blacks, excellent representatives of the high-class Carriers, and the second-prize pen contained a very fine aged hen, but the cock was very short in neck. The *Dragoons* were a nice lot, as also the *Ponters*, in which class Mr. Filton was again in the first rank. *Trumpeters* were good, and the *Barbs* extraordinary, and Mr. Horner won the cup for Pigeons with a well-developed pair of Blacks. In foreign Owls, the Whites in the first-prize pen were very neat in head, and the Blues were also very neat. The first-prize English Owls were good in all points except beaks, which were a little too spindly, although exceedingly good in gullet and frill. Of *Turbits*, the first were Blue, in nice bloom and correct in marking. The first in *Jacobins* were Reds, of high quality and colour, the hood and chain very close. The second were Yellows. The first *Fantails* in style and carriage were all that can be desired, and the second also very good. *Nuns* were neat and well marked. In *Tumblers* the winners were Almonds and Beards, and in the Variety class were some good *Magpies* and *Ice Pigeons*.

There was a good show of *Rabbits*, the Lop-ears measuring well and counting well in points. In bucks Mr. Easton won first and medal for the best Rabbit in the Show with a grand Black and White buck. The second was Blue and White, and the third Yellow and White. In does the first was a Tortoiseshell, not quite so long in ear as the second, but beating in colour, marking, and condition. The Himalayan and the Silver-Greys were shown in good fur, and were a very pretty gathering; and in the Variety class the first and third were excellent Angoras, and the second, a cross between Angora and Lop-ear, was fawn-coloured and of great size. As regards the Rabbits, we believe it is the intention of the Committee to augment the prize list for future shows.

GAME.—Any Variety.—Cockerel.—1, C. Chaloner, Whitwell, Chesterfield. 2, T. Dyson, Halifax. 3, Osborn Bros., Worcester. *Fallow*.—1, C. Chaloner, 2, J. Carlisle, Early. 3, Green & Siffert, Amplebury, Halifax. *he*, Osborn Bros. 4, J. Wade, Bradshaw, Ovensend. *Black-bronzed Red*.—*Chickens*.—Cup, H. Jennings, Allerton. 2, C. Chaloner. 3, J. Wade. *Brown-bronzed Red*.—*Chickens*.—1, J. Carlisle. 2, H. Beadland, Bradford. 3, T. Dyson. *he*, J. Preston. *Duckwings, Blues or Greys*.—1, C. Chaloner. 2, M. Jowett, Clayton. 3, J. Fell, Adwalton. *he*, J. Mason. Any other Variety.—*Chickens*.—1, C. W. Brierley, Middleton. 2, J. Sunderland, Halifax. 3, W. Fell, BAYRAMS. *Game*.—Any Variety.—*Cockerel*.—1, W. F. Entwistle, Westfield, Clackleton. 2, and 3, K. Crosland, Wakefield. *Black-bronzed Red*.—*Chickens*.—Cup, Master J. Crosland, Wakefield. 2 and 3, W. F. Entwistle. 3, F. Steel, Stump Cross, Halifax. *he*, G. Noble, Staincliffe. Any other Variety.—*Chickens*.—1 and 2, T. Dyson. 2, Beltingham & Gill, Burnley. *he*, Miss A. Crosland, Wakefield. 3, W. F. Entwistle. *Black or White*.—*Chickens*.—1, H. Beldon. 2, T. Dyson. 2, J. Walker, Halifax. *he*, Miss M. A. Sandy, Radcliffe, Nottingham. Any other Variety.—*Chickens*.—1, T. C. Harrison, Hull. 2, J. Watts, Birmingham. *HAMBURG*.—*Golden-spangled*.—*Chickens*.—1, H. Beldon. 2, J. Fortune & Co., Norton Banks, Keighley. *Golden-pencilled*.—*Chickens*.—1, H. Beldon. 2, J. Preston, Allerton. 3, J. Sunderland, Halifax. *Silver-spangled*.—*Chickens*.—Cup and 2, H. Beldon. *Silver-pencilled*.—*Chickens*.—1 and 3, H. Beldon. 2, J. Preston. *Black*.—1 and 2, C. Sidgwick, Byddlesdon Hall, Keighley. 3, S. Halliday, Keighley. *SPANISH*.—*Chickens*.—1, C. W. Brierley, Middleton. 2, H. Beldon. 3, E. Brown, Shelfield. *he*, Miss E. Pickard, Thorne, Leeds. *DORKING*.—*Chickens*.—1, T. E. Kell, Wetherby. 2, J. White, Thaby, North-Allerton. *COCHIN-CHINA*.—*Cinnamon or Buff*.—*Chickens*.—Cup, G. Fletcher, Diabry, Manchester. 2, C. Sidgwick, Reddlesdon Hall, Keighley. Any other Variety.—*Chickens*.—1, C. Sidgwick. *BRAMA POOTRA*.—*Chickens*.—1, Mrs. Eurrell, Ipswich. 2, E. Leech, Rochdale. 3, Dr. Holmes, Whitecotes, Chesterfield. *he*, J. Watts. *he*, E. Holland, Chesterfield. *POLAND*.—Any Variety.—*Chickens*.—1 and 3, H. Beldon. 2, H. Bowker, Keighley. *DREKS*.—*Aylesbury*.—1, E. Leech. 2, J. Shillito, Sheffield. 3, W. Stonehouse, Whitby.

he, J. Williams, Wath-upon-Deane. *Boucan*.—1, J. White, Whitley, Netherton. 2, E. Leech. 3, J. Haigh, Huddersfield. *he*, S. H. Stott, Rochdale; Dr. Horsfall, Pontefract. *Any other variety*.—1, C. W. Brierley, Middleton. 2, F. E. Schofield, Morpeth. 3, T. C. Harrison, Hull. *GEESE*.—1, J. White. 2, E. Leech. 3, Rev. G. Hastler, Stillington, York. *he*, S. H. Stott, Rochdale; H. Crossley, Broomfield, Halifax. *TURKEYS*.—1, E. Leech. 2, T. Palethorpe, Carlisle. Pontefract. 3, L. Anson, Forest Hall, Chorley. *SELLING CLASS*.—1, T. C. Harrison, Hull. 2, E. Leech. 3, F. E. Schofield, Stillington. *he*, F. A. Johnson, Wath-upon-Deane; C. W. Brierley. *EXTRA STOCK*.—*he*, Mrs. Wade, Stanley.

PIGEONS.

CARRIERS.—1 and 3, R. Fulton, Deptford. 2, E. Horner, Harewood. *he*, H. Yardley, Birmingham; J. P. White. *DRAGONS*.—1, E. Horner. 2, H. Yardley. 3, F. Graham, Birkenhead. *he*, F. Graham; A. Murgatroyd, Woodroyle, Bradford. *POUTERS*.—1 and 3, R. Fulton. 2, E. Horner. *he*, J. Hawley, Bingley. *TRUMPETERS*.—1, R. Fulton. 2, J. Hawley. 3, E. Horner, Harewood. *BARDS*.—Cup, E. Horner. 2, J. Fielding, jun., Rochdale. 3, R. Fulton. *c*, W. Massey, Spalding. *OWLS*. 1 and 3, J. Fielding, jun. 2, R. Fulton. *he*, Miss Hales, Canterbury. *English*.—1, E. Crossland, Wakefield. 2, G. Horridge, Wakefield. 3, J. Watts. *he*, E. Horner. *TURTLES*.—1, T. C. & F. Newbitt, Epworth. 2, R. Fulton. 3, H. Yardley. *he*, J. Fielding, jun. *c*, E. Horner. *FANTAILS*.—1, J. F. Liversidge, Newark. 2 and 3, E. Horner. *he*, H. Yardley; T. C. & E. Newbitt. *JACOBS*.—1, T. C. & E. Newbitt. 2 and 3, E. Horner. *he*, J. T. Lishman. *SCNS*.—1 and *he*, H. Yardley. 2 and 3, F. Graham. *TRUMPETERS*.—1, E. Horner. 2, R. Fulton. 3, F. Graham, Birkenhead. *he*, J. Fielding, jun. *ANTWERPS*.—1, J. A. Collinson, Halifax. 2, Master J. Crossland. 3, Master C. Crossland. *Equal 3*, E. Horner. *he*, J. Williamson, Wakefield; A. Appleyard, Wakefield. *ANY OTHER VARIETY*.—1, T. C. & E. Newbitt. 2, H. Yardley. 3, A. Murgatroyd. *he*, J. Watts. *SELLING CLASS*.—1, E. Horner. 2, C. Gravit, jun., Thorne. 3, J. Fielding, jun.

RABBITS.

LOP-EARED.—*Back*.—1 and Mohd, A. H. Easton, Hull. 2, Lewin & Johnson. 3, C. Gravit, jun., Thorne. *he*, A. Vaughan; H. Creeke. *Doc*.—1, A. H. Easton. 2, C. Gravit, jun. 3, A. Broughton, Huddersfield. *he*, H. Creeke, Burnley. *HIMALAYAN*.—1, E. S. Rothwell, Rochdale. 2, Master F. W. Horsfall, Pontefract. 3, R. Walfis, Wakefield. *he*, J. R. Jessop, Hull; R. Pearson, Althoys. *SILVER-GREY*.—1 and 3, S. G. Hudson, Hull. 2, E. M. Royds, Greenhill, Rochdale. *he*, A. H. Easton, Hull; E. M. Royds; J. R. Jessop. *ANY OTHER VARIETY*.—1, S. G. Hudson, Huddersfield. 2, E. Vaughan, Hymingham. 3, S. G. Hudson. *he*, W. Hudson, Wakefield; Misses Horsfall, Pontefract.

JUDGES.—Mr. Enoch Hutton, Paisley; Mr. James Dixon, Clayton Bradford; Mr. J. Douglas, Clumber.

STANNINGLEY AND FOLSLEY POULTRY SHOW.

The first annual Show of this Society was held on the 27th of last month. The Committee chiefly consists of working men; but the moral and pecuniary support of the tradesmen and gentry of the neighbourhood have proved the mainstay of the Society. The arrangements were excellent, and there was nothing to mar the pleasure of the visitors, except a little rain which fell at the close of the Show. The entries were good in all the sections, and the quality of the stock very fine. Some of the best of the Yorkshire exhibitors were represented in the poultry classes, and the Pigeons formed a most attractive portion of the Show. The pens for both sections were quite new, on Turner's principle, and were borrowed from the Allerton Society.

The *Cage Birds* were shown in a tent separated from the other departments, and it was crowded to excess during the latter part of the day.

SPANISH.—1, H. Beldon, Bingley. 2, J. Thresh, Bradford. *he*, H. Wilkinson, Earby. *c*, W. Schofield, Gildersome. *COCHINS*.—1, C. Sidgwick, Keighley. 2, H. Beldon. *he*, E. Baxter, Idle. *BEAHM FOOTRAS*.—1, H. Beldon. 2, H. Andrews, Eccleshill. *he*, M. Scott, Ilke. *DORINGS*.—1, T. Briden, Earby. *HAMBURGHS*.—*Silver-spangled*.—1 and 2, H. Beldon. *c*, G. Worsman, Tong. *Golden-spangled*.—1, A. Smith, Northwram. 2, W. Dine, Keighley. *he*, H. Beldon. *Silver-pencilled*.—1 and 2, H. Beldon. *Golden-pencilled*.—1, H. Beldon. 2, W. Clayton, Keighley. *he*, A. Smith, Northwram; Hainsworth and Fyfebank, Farsley; A. W. Bainworth, Farsley. *Black*.—1, C. Sidgwick. 2, H. Beldon. *he*, E. Baxter; 1, W. Hlingworth, Idle. *c*, H. W. Hlingworth. *BANTAMS*.—*Game*.—1 and 2, W. F. Entwistle, Scholes. *he*, A. Smith. *Any other Variety*.—1, H. Beldon. 2, S. & R. Ashton, Mottram. *he*, W. Clayton; T. Dyson, Halifax. *GAME*.—*Cock*.—1, W. F. Entwistle, 2, H. Beaman, Tong. *he*, Harwood & Buckley; E. Ackroyd. *Red*.—1, W. Fell. 2, H. Beldon. *he*, J. Wilson, Calverley. *Any other Colour*.—1, H. Mason, Adwalton. 2, E. Ackroyd, Bradford. *Ducks*.—*Bacon or Aylesbury*.—1, J. Ward, Drighlington. 2, J. Gantt, Paisley. *Any other Variety*.—1, S. & R. Ashton. *ANY OTHER VARIETY*.—1, 2, and Timepiece, H. Beldon.

PIGEONS.

CARRIERS.—1 and 2, E. Horner, Harewood. *he*, S. Smith, Idle. *c*, S. Smith; H. Yardley, Birmingham. *POUTERS*.—1, E. Horner. 2, J. Hawley, Bingley. *he*, J. Hawley; S. Smith; J. T. Lishman, Gillington. *TUMBLERS*.—*Short-faced*.—1 and Timepiece, J. Hawley. 2, E. Horner. *he*, S. Smith; H. Yardley, Birmingham. *OWLS*.—1, E. Horner. 2, J. T. Lishman. *he*, J. Hawley; J. Thresh, Bradford; S. Smith. *TURTLES*.—1, J. T. Lishman. 2, T. C. & E. Newbitt, Epworth. *he*, S. Smith (2). *H*. Yardley; E. Horner (2). *c*, A. Batty, Bramley. *DRAGONS*.—1, H. Yardley. 2, J. T. Lishman. *he*, J. W. Ward, Stanningley; E. Horner. *c*, A. Murgatroyd, Bradford. *ANTWERPS*.—1, J. A. Collinson, Halifax. 2, J. T. Lishman. 3, E. Horner. 4, H. W. Hlingworth. *he*, J. Hawley; H. Yardley; B. Peol, Birkenhead. *JACOBS*.—1 and 2, T. C. & E. Newbitt. *he*, J. Hawley (2); E. Horner. *FANTAILS*.—1, T. C. & E. Newbitt. 2, E. Horner. *he*, J. T. Lishman; H. Yardley. *c*, J. Hawley; E. Horner. *ANY OTHER VARIETY*.—1, E. Horner. 2, J. T. Lishman. *he*, J. Hawley; S. Smith; H. Yardley; A. Murgatroyd.

CAGE BIRDS.

CANARIES.—*Yellow or Marked*.—1 and Cage for best bird in Show, W. Heap, Bradford. 2, T. E. Fosbrooke, Lofthouse. *he*, W. Heap; G. Gott, Calverley. *c*, B. Taneson, Rodley; G. Gott. *Buff and Marked*.—1 and 2, W. Heap. *he*, A. Brook, Swinnow; B. Lawson (2). *c*, G. Gott. *BOTTLED BIRDS*.—1, W. Heap. 2, J. Benn, Upper Workley. *he*, T. E. Fosbrooke. *Parrot or Cuckoo*.—1, W. Gannet, Stanningley. 2, G. Bowling, Stanningley. *he*, W. Heap, Bradford. *he*, W. Heap; J. C. Colson, Stanningley. *FOREIGN BIRDS*.—*Any other Variety*.—1 and 2, W. Heap.

The Judge was Mr. E. Hutton, Paisley.

POULTRY SHOW AT THE CRYSTAL PALACE.—We are informed that negotiations are now pending with the Crystal Palace Company, for a repetition of a London Show this year, and that

it is proposed to be held during the time of the London Cattle Show. Next week we hope to be able to announce it in our usual list of forthcoming Poultry Shows.

FARNWORTH POULTRY SHOW.

The following awards were made in the poultry department at the sixth annual Show of the Farnworth (near Warrington) Agricultural Society held on the 2nd inst. :—

GAME.—*Black-breasted*.—*Chickens*.—1 and Cup, C. Chaloner, Whitwell. 2, J. Halsall, Eccleston. *Brown-breasted*.—*Chickens*.—1, J. Carlisle, Earby. 2, M. A. Forde, Maghull. *Any other variety*.—*Chickens*.—1 and *he*, J. Halsall (Duck-wing). 2, C. Chaloner. *Any colour*.—*Cock*.—1, C. Chaloner. 2, M. A. Forde. *DORINGS*.—*Chickens*.—1, Hon. H. W. Fitzwilliam, Wentworth Woodhouse. 2, H. Pickles, jun., Earby. *SPANISH*.—*Fitzwilliam*.—1, C. W. Brierley, Middleton. 2, H. WOODR, Sheffield. *COCHINS*.—*Cinnamon or Buff*.—*Chickens*.—1 and Cup, W. A. Taylor, Manchester (Buff). 2, Mrs. Burrell, Ipswich (Buff). *W*. W. Ryland, Erdington. *Partridge or any other variety*.—*Chickens*.—1, W. A. Taylor (Partridge). 2, J. Stephens, Walsall. *HAMBURGHS*.—*Golden-pencilled*.—*Chickens*.—1, T. Wrigley, jun., Middleton. 2, H. Pickles, jun. *Golden-spangled*.—*Chickens*.—1, Chaderton & Scholes, Hollinwood. 2, J. Buckley, Ashton-under-Lyne. *Silver-pencilled*.—*Chickens*.—1 and 2, H. Pickles, jun. *Silver-spangled*.—*Chickens*.—1 and Cup, J. Fielding, Newchurch. 2, H. Pickles, jun. *POLANDS*.—*Any Variety*.—*Chickens*.—1 and 2, H. Pickles, jun. (Silver). *PRADMA FOOTRAS*.—*Chickens*.—1 and Cup, Mrs. Burrell. 2, W. A. Taylor. *BANTAMS*.—*Game*.—*Chickens*.—1 and Cup, J. W. Morris. 2 and *he*, W. F. Entwistle, Cleckheaton. *Cock*.—1, J. W. Morris. 2, G. Maples, Wavertree. *he*, W. F. Entwistle (2). *Any Breed*.—*Chickens*.—1, Withheld. 2, S. & R. Ashton, Mottram (Black Bantams). *ANY OTHER VARIETY*.—*Chickens*.—1, Hon. C. W. Fitzwilliam. 2, A. D. Payne, Shrewsbury (Malay). *SELLING CLASS*.—*Chickens*.—1, Withheld. 2, H. Pickles, jun. (Polish). *DUCKS*.—*Bacon*.—1 and Cup, A. Woods, Sutton. 2, F. Grall. *he*, G. Gladstone, jun., Broad Green; T. Wakefield, Golborne. *Aylesbury*.—1, E. Leech. 2 and *he*, M. Scamson, Hartwell, Aylesbury. *Any other variety*.—1, C. W. Brierley. 2, H. B. Smith, Broughton (Shields) *he*, R. Gladstone, jun. (Carolinas and Brown Calls). *GEESE*.—1, E. Leech. 2, Withheld. *TURKEYS*.—1, E. Leech.

JUDGES.—Mr. Richard Teebay, Fulwood, Preston; Mr. Joseph Hindson, Barton House, Everton.

BINGLEY POULTRY SHOW.

The best of the chicken shows of the present season is, undoubtedly, that held at Bingley, under the auspices of the Airedale Agricultural Association. The greater part of the poultry pens were arranged round the sides and part through the centre in single tier, the only drawback being that the Pigeons were placed on the top, which was a great disadvantage for both Judges and the public. Of *Game* fowl there were some good birds in both classes, the cup falling to Black Reds, and the display of Duckings was such as we did not expect to find at this time of year, the colour of both cockerels and pullets being very fine. *Spanish* were but moderate, but the *Dorkings* very large and good in colour, and Mr. Kell won the cup for this section with birds of this variety. *Cochins* and *Beahms* were of high quality. But with the exception of the winners the Golden-spangles were poor. The rest of the *Hamburghs* mustered well. The quality was of high order, although the *Gold-pencils* showed somewhat later than was the case last year. *Polands* were good and were all *Silvers*. All the *Bantams* were good, and the cup awarded to *Game*. In the *Selling Class* *Game* were first, *Spanish* second, and *Polands* third. The *Ducks* were large and good in beak and plumage.

Among the *Pigeons* were some of the best specimens in the kingdom. In *Pouter* cocks many of the birds were out of feather. The first *White*, and the second *Blue*. In *Pouter* hens a capital *Yellow* was first, and won also the cup for the first eight classes. The *Carriers* were well represented in both sexes. The *Almonds* were good throughout, and the first-prize pen nearly perfect. In other *Tumblers*, *Red Mottles* were first, *Bluebeards* second, and *Kites* third. The *Barbs* were very broad in skull and good in eye. In *Owls*, *Whites* were first, and *Blues* second and third. The *Jacobins* were a neat lot, close in *mphod* and chain, and very sound in colour; but the best gathering of this section was the *Fantails*, the carriage and style perfect. In the "Variety class," *Porcelain Swallows* were first, *Reds* second, and *Runts* third. The first in the *Selling* class were *Agates*, and second, *Turbits*.

The heaviest *Rabbits* were 13½ and 13¼ lbs. The length of the ears 22 inches, and the width a little over 5 inches. The first-prize *Lop-car* was a grand *Black* and *White* buck, the second *Grey*, and the third *Tortoiseshell*. The class for varieties was good in all respects, the first a perfect *Himalayan*, the second *Silver-Grey*, and the third *Angora*, and many capital specimens had to be content with commendation only.

GAME.—*Black and other Reds*.—Cap, J. Preston. 2, J. Carlisle, Earby. 3, W. Bentley. *c*, J. Irid, Bingley. *Any other Variety*.—1, M. Jowett, Clayton. 2, J. Carlisle. 3, G. Ambler, Queensbury, Halifax. *he*, J. Fortune, Newton Banks. *c*, T. Briggs, Bingley. *SPANISH*.—1, H. Beldon, Bingley. 2, J. Newton, Silsden. 3, E. Brown, Sheffield. *c*, J. I. Booth, Silsden; J. Thresh, Bradford. *DORING*.—1, 2, and Cup, T. E. Kell, Wetherby; 3, J. White, Northallerton. *he*, T. Briden, Earby. *COCHINS*.—1, 2, and 3, C. Sidgwick, Rydlesden Hall, Keighley. *HAMBURGH*.—1, E. Leech. 2, W. Hurry, Sheffield. 3, W. Whitley, Sheffield. *HAMBURGH*.—*Gold-spangled*.—1 and Cup, W. Driver, Keighley. 2, T. Wray, Wolverhampton. 3, T. Dean, Keighley. *he*, C. Halstead, Bingley. *Silver-spangled*.—1 and 2, H. Beldon. 3, G. & J. Duckworth, Church, Accrington. *c*, W. Bairstow, Bingley. *Black*.—1 and 3, C. Sidgwick. 2, H. Beldon. *he*, J. Cockerott, Hawkehead, Keighley. *Gold-pencilled*.—1 and 3, H. Beldon. 2, J. Wilkinson, Earby. *he*, E. Clayton, Morton Banks; J. Smith, Gilstead; T. King, Bachelshwaite, Bingley. *Silver-pencilled*.—1 and Cup, H. Beldon. 2, E. Louchford, Bingley. 3, T. Longbottom, Bingley. *ANY OTHER VARIETY*.—EXCEPT *BANTAMS*.—1 and 3, H. Beldon. 2, H. Bowker, Hill Top, Keighley. *BANTAMS*.—*Game*.—1, 3, and Cup, W. F. Entwistle, Cleckheaton. 2, G. Noble, Stainchiff, Dewsbury. *he*, Harewood & Buckley, Accrington. *Any other*

variety.—1, H. Beldon, 2, T. C. Harrison, Hull, 3, J. Riley, Hawksworth, *hc*, W. H. Robinson, Long Lee, Kegbly; H. Beldon. **SELLING CLASS**.—1, W. Johnson, Idle, 2, J. J. Booth, 3, J. Swire, Morton, c, J. Berry, Silsden. **Ducks**.—*Aylesbury*.—1, E. Leech, 2, G. Andrews, Newark. *Bouen*.—1, E. Leech, 2, J. J. Booth, 3, C. Sidgwick. *hc*, J. Clayton, Kegbly. *Any variety*.—*Ducklings*.—1, J. J. Booth, 2, J. Watts, Birmingham, 3, H. Cockshott, Morton.

PIGEONS.

POUTER.—*Cock*.—1, J. Hawley, 2, R. Fulton, Deptford, 3, W. Harvey, Sheffield. *hc*, J. Hawley; J. Walker, Newark; R. Fulton (2); E. Horner, Harewood. *Hen*.—1, 3, and Cup, R. Fulton, 2, E. Horner. *hc*, J. Hawley (2); R. Fulton, 3, E. Horner. *Cock*.—1, R. Fulton, 2, H. Yardley, 3, E. Horner. *hc*, R. Fulton, 2, E. Horner. *Hen*.—1 and 2, R. Fulton, 3, E. Horner. *hc*, H. Yardley; R. Fulton. **TUMBLERS**.—*Almond*.—1, R. Fulton, 2, E. Horner, 3, J. Fielding, jun., Rochdale, *hc*, W. Harvey, Sheffield. *Any other variety*.—1, T. H. Hawley, 2, J. Fielding, jun., 3, R. Fulton. *hc*, J. Hawley; R. Fulton, c, W. Harvey. **BARDS**.—1, E. Horner, 2, J. Fielding, jun., 3, R. Fulton. *hc*, W. Harvey; R. Fulton. **OWLS**.—1, J. Fielding, jun., 2, R. Fulton, 3, W. Harvey. *hc*, F. Moore; J. Fielding, jun. **JACOBIUS**.—1, R. Fulton, 2 and 3, E. Horner. *hc*, W. Harvey; E. Horner. **TRUMPETERS**.—1 and 2, J. Hawley, 3, W. Harvey. **FANTAILS**.—1 and Cup, W. Harvey, 2, J. F. Loversidge, 3, E. Horner. *hc*, J. Walker, Newark; C. Sugden, Wilsden; F. Graham, Birkenhead. **TREBITS**.—1, J. Fielding, jun., 2, R. Fulton, 3, Clayton & Birstow, Gillingham, Bradford, *hc*, E. Horner; J. T. Lishman, Gillingham, Bradford. **DRAGONS**.—1, F. Graham, 2, H. Yardley, 3, J. Watts. *hc*, J. Hawley; Clayton & Birstow; W. Harvey; W. Stanhope, Eccleshill; E. Horner. **ANTWERPS**.—1, J. Collinson, Halifax, 2, E. Horner, 3, J. T. Lishman. *hc*, H. Yardley; W. Harvey, Birkenshaw. *Any other variety*.—1, J. T. Lishman, 2 and *hc*, E. Horner, 3, S. Smith, Idle, c, W. Harvey; H. Yardley. **SELLING CLASS**.—1, J. Fielding, jun., 2 and *hc*, Clayton & Birstow, 3, J. Watts, c, J. Hawley; W. Hingworth; W. Stanhope; E. Horner.

RABBITS.—*Heariest*.—1, E. Vaughan, Birmingham, 2, A. H. Easton, Hull, 3, J. Quick, St. John's Wood. *Lop-eared*.—1, A. H. Easton, 2 and *hc*, C. King, St. John's Wood, London, 3, Lewin & Johnson, Kettering, c, W. Scarbrook, St. John's Wood. *Any other variety*.—1, A. L. Rawstraw, Haslingden, 2, E. F. M. Roys, Greenhill, Kochdale, 3, M. Driver, Morton. *hc*, E. Vaughan; A. H. Easton; S. G. Hudson (2); J. R. Jessop (2).

The Judge was Mr. E. Hutton, Pudsey, Leeds.

SOUTH-WEST AGRICULTURAL SOCIETY'S
POULTRY SHOW.

This was held at Limerick on August 30th.

DORKINGS.—1 and *hc*, Mrs. Warburton, 2, S. Mowbray, SPANISH.—1, S. Mowbray, 2, J. C. Cooper, *hc*, E. G. Poer, BRAHMAS.—1 and c, J. C. Cooper, 2, Mrs. Warburton. *hc*, Hon. J. Massey; Mrs. Warburton. **GAME**.—1, 2, and *hc*, E. G. Poer. **ANY OTHER VARIETY**.—1, 2, and *hc*, J. C. Cooper, *hc*, E. G. Poer; Hon. J. Massey. **DUCKS**.—1, Hon. J. Massey, 2, J. C. Cooper, *hc*, J. C. Cooper; W. Lysrecht; S. Mowbray. **DUCKINGS**.—1, Hon. J. Massey, 2, Mrs. Warburton. **GEES**.—1, S. Mowbray, 2, J. C. Cooper, Extra 2, Mrs. Warburton. *hc*, Hon. J. Massey; J. C. JUDGE.—Mr. C. F. Staunton, Clondalkin.

PIGEONS AT WHITWORTH AND ROCHDALE
POULTRY SHOW.

The Pigeons at Rochdale were one of the most attractive features of the Exhibition, and as would be seen by the prize list published last week, not only were the entries unusually large for an agricultural meeting, but the choicest specimens from many of the best collections in the kingdom were brought together, thanks to the enterprise and judicious management of Messrs. Roys and Fielding—two most enthusiastic local fanciers, to whom, we believe, the success of this department of the Show is due.

With an entry of 288 pairs of Pigeons the services of two well-known Judges were secured, the classes being divided between them with the exception of the special prizes, which were awarded conjointly, the first prize in each class only, of course, competing. This arrangement is very objectionable, for we think each Judge should also award the special prizes in the portion entrusted to him.

Pouters had four classes. In those for single cocks and hens respectively, Red or Yellow, the latter colour took the lead, Mr. Fulton winning with very fine birds. The principal prizes in the other classes were awarded to capital Blues, with the exception of the third prize being taken by a good White hen.

Carriers had the like number of classes, with a good competition. Mr. Wiltshire's first-prize Black cock was particularly good in beak and wattle. The single Black hens formed a fine class, Mr. Fulton taking all the prizes, and also the sectional cup, with his first-prize hen. All were remarkably good specimens, shown in the finest possible manner. Several excellent hens received notice. The Duns were not so numerous, hot good in quality.

Short-faced *Tumblers* were well represented, having three classes—namely, Almonds, Balds or Beards, and Any other variety. Curiously enough in every class the southern fanciers had to give place to local exhibitors. Mr. Fielding's splendid pair of Almonds also gained the sectional cup. The same exhibitor held his usual place in Balds and Beards. In the Any other variety class Mr. Minnett, jun., took first with a magnificent pair of Black Mottles, Mr. Hawley having second with an equally fine pair of Red Mottles, the best we have seen for some time.

Owls, foreign and English, had each a class, which was well filled.

Bards were divided into Blacks and Any other colour, and were a show of themselves; indeed, it is very seldom we have seen such a competition. Captain Heaton took the first prize, as well as the sectional cup and the second prize, for Blacks with splendid birds, evenly matched, and shown in admirable condition, while Mr. J. Firth, jun., was third with a remarkably good pen; the cock is one of

the best in the kingdom, but requires a more developed hen to match him. We understand £25 were offered for this cock and declined.

Turbits, Red or Yellow, competed together, while *Turbits*, Any other colour, also had a class. Mr. Fielding took both first prizes with small, fine, well-marked birds.

Nuns were a poor lot, only one prize being awarded; want of merit, trimming, and disease being the causes of the prizes being withheld.

Jacobus were good. In the class for Yellows Mr. Horner was first, also taking the sectional cup with a splendid pen. For Any other colour Mr. Horner also took the first prize with excellent Reds, and particularly fine Blacks were second and third. Mr. E. E. M. Roys also exhibited, not for competition, his crack pair of Black Jacobus, winners of cups and prizes at most of the leading shows.

Through the considerate interest of Mr. Roys, Messrs. Otley, of Birmingham, offered a silver medal for the best pair of Antwerps, which Mr. Horner obtained with very smart Dons. The class contained many good birds, the cocks being generally of great merit, but in most cases imperfectly or indifferently matched in some respect.

Fantails and *Dragons* were average classes. *Trumpeters* were good. Mr. Horner was first with Dark Mottles in a very keen competition with Mr. Haansbergen's Light Mottles; the latter were unusually good in points, but rather too light in colour. The third position was taken by good Whites. There was nothing particularly new or worthy of especial remark in "Any other variety" class.

HOW LONG ARE QUEENS AND WORKERS
IN THEIR CELLS?

WITH the "Handy-Book of Bees" I am not acquainted, but from the extracts given, and the reviews of the work which appeared in several newspapers, I have formed a very high idea of the author, both as an elegant writer and a practical apiarist. I am, however, rather surprised that the evidence adduced by Mr. Woodbury has not convinced him that he is undoubtedly mistaken when he says that "perfect queens are produced on the fourteenth day after eggs have been put into royal cells." Instances, I do not deny, may have occurred, but none have come under my observation, and I am not aware of Mr. Pettigrew having given any proof of the allegation beyond a mere *ipse dixit*. I would, therefore, like him to say that he has actually witnessed what he states, and that his conclusions have been arrived at, not by inference, but from observations correctly made.

It is well known that the evolution of queens and bees is much influenced by temperature and the supplies without, but the circumstance of hatching being hastened or retarded in particular cases does not affect the general law. The commonly received opinion, that twenty-one days are required for the egg of the hen to hatch, is not proved to be erroneous by large hens' eggs needing to remain under the hen twenty-three or twenty-four days. Exceptions prove the rule. To my mind the experiments conducted by Mr. Woodbury satisfactorily prove his position. He tells us that the colony employed by him was "populous," and that the period selected for applying his test was "the height of a very favourable season." All the conditions requisite for determining the point at issue appear to have been present, and the result showed that sixteen days were required for the evolution of a queen from an egg.

The general rule I believe is this, that if the queen regnant is removed from her hive, a young queen as successor will make her appearance on the fourteenth day; but this circumstance does not prove that fourteen days and no more have elapsed since the hour that the egg from which she proceeds was deposited. Bees when their queen is removed do not immediately discover their loss, but they are seldom so long in finding out the calamity that has befallen them as to be under the necessity of selecting for royal honours the larvæ that proceed from the most recently-laid eggs. The fact that open cells containing larvæ are almost always to be seen for a day or two after the royal cells are sealed, shows that they are relatively younger.

The precise age, however, of enclosed queens, and the time required for their evolution, has been ascertained on ocular evidence, and as I have had considerable experience with regard to the matter, I shall relate some experiments that were made a few years ago which bear on the questions at issue between Mr. Pettigrew and Mr. Woodbury. In 1862 I lodged a swarm in the "mirror hive," which is described in the "Naturalist's Library." On August 20th eggs for the first time were seen to be laid. On the 26th the cells were sealed. On September 7th the young bees had left their cells, and the entry made in my note-book of that date, and which I copy verbatim, is "Bees hatched-out in about eighteen days." Again, on the

15th of July, 1863, I lodged a second cast in a small glass uncomb. On the 22nd the young queen was impregnated. On the 25th numbers of eggs were laid, and on the 27th I removed her from the hive. The bees selected a grub for a queen from the earlier-laid eggs. It was sealed August 2nd, and a young queen emanated on the 10th. On the 16th every young bee had left its cell save three, of which no record has been taken whether they were abortive or ultimately hatched out. I may also mention that in the same year (1863) I removed the queen from a Huber hive, that a young queen emanated on the thirteenth day after her removal, and that every common bee had vacated its cell before the nineteenth.

It is unnecessary to multiply proofs, but I can give them if needed. Meanwhile I shall only add that it is my firm conviction, founded on personal experience, that the views advanced by Mr. Woodbury in opposition to those of Mr. Pettigrew are correct.—R. S.

OUR LETTER BOX.

HARD PROJECTING LEG-SCALES (P. A. M.).—It is comparatively a new disorder, and is very prevalent among poultry. We have it among ours, but it is chiefly confined to Cochins and to the oldest birds. It has also shown itself this year on the legs of a Chinese Pheasant. We are trying experiments, but we have discovered no remedy.

CROSSING HONDANS AND DORINGS (R. H. F.).—The Hondan would not be the bird you require; it is a non-sitter, and we always protest against crossing between those and sitters. It is against all reason. We can easily name a cross that will suit you in all respects but one, that is the size of the eggs. You will not in any of the sitting breeds get larger eggs than you do from the Dorking. We advise you to cross between the Dorking and Brahma Pouter if you want a good hardy fowl that will lay and sit well, rear its young without trouble, and make a capital bird at table. We are never friendly to crosses, but we think this is the best we know.

CHICKENS WITH NOSTRIL DISCHARGE (W. B. E.).—Your Hamburgs are suffering from cold, which will, if neglected, turn to roup. If only part of them are affected remove them from the others. Wash their nostrils with cold water and vinegar. Give each bird two pills of camphor each the size of a pea. Feed them twice per day for a time on bread and ale. Discontinue the sharps and potatoes. Use Ealy's pills.

BRAHMA COCK MOULTING (J. A. C.).—Brahma cocks of the age you name are often a long time getting their feathers, and we do not think the bird you mention will be in full plumage before the end of September or beginning of October. He may, however, be fit to exhibit, although not quite moulted, as he will in all probability be shown against birds of his own age. It will be a good thing if his sickle feathers never come back. Feed him well on ground oats, give him bread soaked in milk, and let him have plenty of green food, lettuce above all.

DOUBLE NAIL (A. K. C.).—This on a Dorking cockerel's toe is no doubt a disadvantage, but could only prejudice success where the competition between two birds was so close the judges had to look to some such accident to enable them to decide, otherwise it would not disqualify the bird.

YOUNG TURKEYS DYING (F. I. C.).—We advise you to remove all the healthy birds to some other place; it is always a risk and a mistake to keep healthy and diseased birds together. You do not say on what you feed. From your description of the crops of your birds we should think there was something wrong in their diet. Even if they roost too thickly that would not account for it; that would produce the swelled heads, which you seem to have overcome. In all cases where food remains in the crop pour warm water down the throats freely, afterwards give each a table-spoonful of castor oil. Give two pills of camphor each the size of a garden pea. Feed only on bread and ale, ground oats mixed with milk, and having onion-tops chopped fine with the ground oats. This treatment must be continued till they are well. It would be beneficial if you have a convenient place, such as an old barn, if you were to shut up the invalids. They would require large sods with plenty of growing grass and mould to be given to them daily, as well as the food we have recommended.

WHITWORTH AND ROCHDALE POULTRY SHOW.—Mr. S. H. Stott, of Quarry Hill, Rochdale, states that he, and not the Rev. G. Hunster, took the first prize for Grey Geese at this Show. The error is that of the prize list forwarded to us.

KEIGHLEY SHOW (J. G.).—If, as you say, your birds were not exhibited owing to the mistake made by the Secretary, the Committee ought to return you the entrance money.

RATS IN A PIGEON LOFT, AND PROPER FOOD FOR PIGEONS (A Weekly Reader).—Gas tar frequently applied to the runs of rats will cause the rats to leave. They are cleanly animals, and cannot bear the touch of tar. We have got rid of the vermin from a pigsty in this way. The tar once dried is, however, of no use, as it will not stick to the rat's fur. The best plan you could adopt would be to put sheeting of tin on the wall the rats run up, letting a piece of tin stand out at right angles from the wall, projecting, say, half a foot or more; the rats could not get above that. Let not the tin be painted, nor have anything on it to give foothold. As to the best food for Pigeons, a mixture of peas, Indian corn, and barley is excellent. We add barley for the sake of the young birds which their parents are just ceasing to feed. They go about in a starved condition, unable to pick up the peas or Indian corn, so we always have some smaller grain mixed with them. They also readily pick up charlock, which the farmers gladly give away, only take care it does not get into your garden.

FOOD FOR SILVER-GRAY AND ANGORA RABBITS (—).—Clover, Vetches, Dandelion, Carrots, Turnips, &c., with crushed oats, bran, Indian meal boiled into porridge, say once or twice a week. This fattens them. Too much green is objectionable, and avoid cabbage. Oat straw and sweet hay they like, and are good for them. They will not succeed well upon the ground all winter, especially the Angora, being hutch Rabbits. The Silver-Grey may be allowed to run as the wild Rabbit, and many are

turned out with them to improve the fur. If intended to remain outside all winter in hutches these must be made warm and dry, 2 feet above ground, and placed with a south aspect. Avoid all damp air, as this gives them the smulles. To remove them from the hutches to place them upon the ground (but never except it is dry), take hold of the ears with one hand, and place the other hand under the hind part of the Rabbit, so as to prevent the hind legs bracing out the bedding with them. If the hutches are 5 or 6 feet in superficial extent they will not often require any exercise out of them; yet to let them have a frisk upon a lawn when the grass is dry is by no means objectionable. All green food should be given dry, or it tends to give the Rabbit the rot; and in the absence of green food soaked peas are good twice a-week, with a little clean water, especially during hot weather.

UNITING SWARMS (T. M. N.).—The dead bees were all workers, but we cannot tell why they were killed, except that in this mode of uniting more or less fighting often ensues. The best plan is to drive both lots of bees into the same empty hive one after the other, and then induce them into their permanent home by knocking the united cluster out on a cloth and placing their hive over them. It is not absolutely necessary to remove one of the queens, although it is well to do so if the opportunity presents itself. Your syrup appears to have been too thick, but the crystals will not injure the bees. We use three parts sugar to two parts water by weight.

COMMENCING BEE-KEEPING (T. A.).—A stock of bees ought at this season to be readily obtainable for the bare value of the hive and the honey which it may be fairly estimated to contain. Get "Bee-keeping for the Many," which may be had free from this office for five stamps, and select from the hives therein described the one which you think most likely to meet your views. If the bees now belong to a near neighbour many will return to the old spot and be lost, thereby weakening the colony, a result which would be avoided if they were brought from a distance of not less than a mile and a half. We cannot recommend you, as a novice, to attempt transferring the stock to a new hive, but should rather advise your waiting for it to swarm in the usual way.

STEWING VEGETABLE MARROWS.—"E. A. M." recommends the following recipe. Just scald the vegetable. When a little softened cut off one end and scoop out the seeds; fill with chopped meat that has been partly cooked, a little parsley, pepper, and salt; lay them in a saucepan the cut end uppermost, to keep out steam and water; add some good gravy flavoured with tomato, and let them stew gently.

METEOROLOGICAL OBSERVATIONS

From observations taken near London during the last forty-three years, the average day temperature of the week is 67.8, and its night temperature 45.6°. The greatest heat was 87°, on the 15th, 1865; and the lowest cold 29°, on the 17th, 1840. The greatest fall of rain was 0.99 inch.

PLANTS FOR BASKETS AND VASES.

EVERYTHING in its place, and a place for everything," is a saying applicable to more things than those for which it was first intended, and even in gardening matters a just application of this rule is not met with in every case. It is with a view to help the inexperienced that I purpose calling attention to the plants suitable for vases and similar positions, as well as to those which are unsuitable for the purpose. I do not

profess to give a complete list of such plants, for many others might be added, and possibly some cultivators may differ with me as regards the merits and demerits of those which I shall name. This I shall be the last to find fault with, as with other treatment from that adopted here the plants may give different results.

The plants which I shall notice are those suitable for growing in vases or baskets out of doors, and I use the term growing in the full sense of the word, and not as implying that the plants may be reared elsewhere, and placed in a vase when they are ornamental, and removed when they are no longer so. This mode of treating vases is, I know, very frequently adopted, and with good results; but, to save trouble and expense, a more economical plan has often to be put in practice by those who have not the means of changing the plants often. I shall therefore confine my remarks to vases or baskets which are expected to support during the whole of the growing season a set of plants which must have a creditable, if not gay, appearance throughout that time. The number of plants capable of fulfilling this requirement is by no means so great as might be expected, still they are varied, and, doubtless, considerable additions may be made. One property all such plants must have is that of supporting a healthy growth in a flowering condition on the smallest quantity of soil that can well be allowed them; for with the exception of water or other liquid, it is seldom that any additional help can be given after they are once put in position. Fragile delicate plants are also to be avoided; for vases are often placed in windy situations; yet hanging plants are indispensable, but they ought to be selected with care. Flowers that will endure wind and sun are also requisite, and when plants are made use of for their foliage they must be of the most robust character. There are some other desirable properties, but they will be explained as the plants possessing them come under notice.

I will now suppose that a series of vases or tazzas on a parapet wall bordering a terrace have to be filled, and very often such vases are better adapted for appearance than for the growth of plants; the Grecian tazza, in particular, being very shallow, especially near the edges, yet a broad brim or edge is expected to be covered with foliage of some kind. Wooden or wire baskets are sometimes deeper, and even some kinds of vases, as the Warwick and Maltese, are tolerably deep, still the extent of outer surface to be partially covered with pendant plants or flowers is such that the space allotted for soil is in no instance in excess

of what is wanted. I have found by experience that the soil ought always to be of the soundest description, and not rendered too light by its containing much partially-decayed matter, even if that be turf itself, for a certain amount of solidity is required which leaf mould and half-decayed turf does not possess. One of the best mixtures I ever succeeded in making for supporting plants in vases for a lengthened time contained a large proportion of mud from a lawn drain, good garden soil and sand being the other ingredients. The "staying" powers of this soil were better than in any I ever tried. Of course sufficient sand was added to make the whole porous. It is usual to supply vase plants with manure water occasionally, but unless it is very clear indeed it tends to sodden and choke up ordinary soils, it is therefore advisable not to be too sparing of the sand added. Drainage, also, is an essential matter, and some vases are without any means of securing this, and care must consequently be taken to guard against the inconveniences attending its absence. A greater proportion of broken stones, brickbats, or crocks ought to be placed at the bottom, and covered with some moss before the soil is put in, so that all superfluous water may drain to the bottom; judgment must likewise be exercised in not giving more water than is necessary to moisten the soil, so that it may accumulate as little as possible at the bottom. This remark, of course, only relates to such vases as have no hole at the bottom by which the water can drain away. The modern vases, however, generally have some provision of the kind, and are as a consequence easily enough managed. In their case a few rough crocks at the bottom, with smaller ones over them, are all that is generally required, and the shape of the vases usually insures all the surplus water draining to the proper outlet.

Assuming these matters to be all well attended to, and each vase about half-filled with earth, I will now proceed to the planting. If summer-flowering or other showy plants are decided on, it is desirable to prepare them beforehand, or to pick from amongst those intended for the flower garden such as are most suitable for the work, taking care to have a few large plants for the centre, with smaller plants for the sides. All should be fully hardened-off before being turned out in exposed quarters. I will now commence with one of the most popular plants for the flower garden, the conservatory, and the vase or basket—the Geranium.

GERANIUMS.—Most of the varieties used in bedding may be planted in vases, excepting, perhaps, the dwarf slow-growing kinds, which ought only to be so used where the intention is to frequently change them; and as the plan is more like exhibiting them in vases than growing them there, I have at the commencement of this paper disavowed it. Therefore I recommend only the strong-growing kinds, of which there is an endless variety, but amongst them some are better fitted for the purpose than others. The Golden Tricolors do not always grow fast enough to meet our requirements in every case when there are only small plants to begin with, and the Silver Tricolors are still more slow of growth, but where great variety is wanted both may be used. A pair of our best-filled vases

at the present time (the beginning of September), have Mrs. Pollock in the centre, and the white-flowering Ivy-leaved round the outside. The latter, by its robust character, makes up for all the shortcomings of Mrs. Pollock, and nothing can well exceed the profusion of its pendant shoots with its glossy green foliage reflecting the pretty white blooms, while in the interior some of its shoots climbing amongst the stems of Mrs. Pollock improve the effect rather than diminish it. In planting such vases, however, select the best Golden Tricolors—that is to say, the largest, with only small plants of the Ivy-leaved Geraniums, as the latter by their more rapid growth soon overtake the former. The crimson-flowered Ivy-leaf is, on the whole, not so useful as the white-flowered, but may, nevertheless, be often used with advantage; and a vase filled in the centre with a pink-flowered Zonal Geranium—for instance, *Christine*—may have an edging of the crimson-flowered Ivy-leaved with perfect propriety, and some we have so treated look well. We employed a stronger grower than *Christine* for the centre, but of the same colour; but I regard the Ivy-leaved Geraniums as the most essential of any for vase decoration, and a good pink-flowered kind is certainly as useful as either the crimson or white. There is one with thick glossy green leaves and a good-sized pink flower that is occasionally met with, but I am not sure whether it has ever been dignified with a distinctive name, still it is a great improvement on the oldest variety of this class, and makes an excellent vase plant, possessing the free growth of the two kinds mentioned with flowers of a bright pink colour. The Golden Ivy-leaf has also pink flowers, but they are less plentifully produced, and on the whole the plant seldom looks so well as the sorts just referred to. There is hardly yellow enough in its foliage to entitle it to the term golden, and in the distance it rather looks diseased than edged with that rich striking hue, but it grows and flowers freely, and many persons like it; an improvement, however, rendering it as bright as Golden Chain is much wanted. I am also constrained to make a similar complaint of the only silver-edged Ivy-leaf I have used for the purpose, *L'Élégante*. It may have more merit as an ornamental-foliaged plant, but its habit with me has been for its shoots to grow over and amongst each other, and not strike out boldly for the edge of the basket or vase; even where they are tempted or constrained to do so they do not bend down in the same graceful way as the flower-iog varieties first mentioned. The leaves seem to want the weight necessary to bend the shoots downwards, and the latter stick out horizontally in anything but a graceful manner. I am sorry for this, for the fine growth and other characteristics of the plant appear to claim for it a high position as a vase plant; but as I regard training, excepting of the very simplest kind, as out of the question here, I am constrained to place this plant lower in the scale of useful ones than I should like.

In weighing the respective merits of ordinary bedding Geraniums, the position of the vase with respect to other things must be taken into consideration. If the vase should be so placed as to have a building of a light colour as a sort of background, then let scarlet, or some other colour approaching it, prevail; but if the background is of foliage, a light-coloured flowering Geranium will be most telling—say pink, blush, flesh-coloured, or white, which colours stand out well against evergreens and similar plants, and should therefore be liberally employed in such places.

I may here remark, that whatever colour is determined on, generally the Zonal Geraniums are better than the Nosegays, especially late in the season. It may be true that at some particular time, for instance the month of August, the Nosegays may present a mass of bloom, which the others fail to do; but the bloom does not stand the long dewy nights and frequent wettings of the latter part of the season. This observation applies to plants in beds as well as to those in vases. I may also observe, that where an edging of Ivy-leaved Geraniums like those recommended is used, upright-growing Zonals may be planted in the centre, instead of those of spreading habit; for instance, an old variety called *Crystal Palace Scarlet* has an upright growth, and most of its flowers likewise point upwards, which is not the case with *Tom Thumb*, neither is it so with *Cybister* and *Stella*, popular Nosegay Geraniums; but where no edging plant is used, then a spreading habit is indispensable. The confinement of the roots of the plant when in a vase checks all robust growth, therefore the most vigorous growers may often be planted without any danger of grossness, and even the rank habit of most of the double varieties may be so much altered by confinement that free-flowering specimens will be produced, and the present season they have done remarkably

well in this position. Madame and Marie Lemoine, Andrew Henderson, *Triomphe*, and others, all gross in habit, have become more free-flowering, and the almost entire absence of rain has, no doubt, tended to make the beauty of the blooms continue longer than would have been the case in a moister season. Their satisfactory flowering this season entitles them to be tried again, for it a certain number of plants of a good double variety present only half the number of blooms that such free flowerers as *Orange Nosegay*, *Indian Yellow*, *Brilliant*, and single varieties of old date exhibit, the fact of their being double will insure them many admirers. Double Geraniums edged with some other plant may be set down as well deserving of notice.

The old-fashioned *Mangles's Variegated* must not be forgotten, for it is well deserving a place, although it does not withstand the wind so well as the stronger varieties of the Ivy-leaved section, neither is its habit so truly pendant. Most of the greenhouse varieties of *Pelargoniums*, as they are commonly called (for I am unwilling to apply that term to the bedding Zonals), are not at all suited for the summer decoration of vases and baskets, with the exception, it may be, of some of the smaller-leaved varieties of the Oak-leaved section, of which the old *Shrubland Pet* might be regarded as the type, but the shortness of its flower-stalk, as well as that of most others, is a drawback to its use for this purpose, except in some special cases. The different varieties of sweet-scented Geraniums are better suited for the mixed border, where a sprig may be cut for every bouquet.—J. ROBSON.

(To be continued.)

DAMSONS.

OBSERVING a few weeks since Mr. Robson's remarks on Crittenden's Damson, I wrote to my friend Mr. Roach Smith, at Stroud, asking him if the sort he gave me a few years since under the name of the Cluster Damson was not the same, and I enclose his reply, which is as follows:—

"My former tenant, the late William Herbert, informed me he noticed for years that in his plantation of fruit trees opposite my house one Damson tree bore constantly, while the others had fruit only once in two or three, or three or four years, and then only sparingly. He then noticed that the habit of the tree was different from that of the old or common kind, being more spreading, while the other grows up tapering and loose. But the grand characteristic is its enormous crops of fruit, failing only once or so in ten or twelve years. It must have been fully twenty-five years ago when Herbert discovered this tree; and the tree could not well have been under fifteen years old, as he said he always made £1 a year by it. But who is Crittenden? Did he not have it (if the same) of Herbert? Herbert had no idea of husbanding the treasure he had by sheer luck got hold of.—C. ROACH SMITH."

Damsons are undoubtedly the first remove from the Sloe, for I perfectly well remember, some sixty or seventy years since, my father raising a large number from seed, thinking to get up a large stock. The trees came into full bearing when I was a youth, and I recollect that they were unfit for sale, for the greater number bore small round fruit, much like Sloes, but with less roughness and acidity. Among Damsons the Prune or Shropshire Damson bears the palm for flavour, and, if Mr. Pearson would tell us about his, I have no doubt that the produce of his trees would rival that of Mr. Crittenden. The Dallymple Damson has the downy leaves of the Prune Damson, but is of stiffer growth; it is Scotch, and very hardy. Here we have the English Damson larger than the Prune or the Cluster, and really good. I have suckers from trees planted by my great grandfather about 1730.

The American Damson was so highly eulogised by the late C. J. Downing some years ago, and I was so taken by his vivid description, that I imported trees from America and planted a hedge 300 or 100 yards long. The trees are about twenty odd years old; the fruit, now nearly ripe, is round, and good in flavour without roughness, but it does not bear so well as the Cluster or the Prune Damson. Another Damson I received from Mr. Varden under a name common in Hertfordshire many years ago, but now not known; this is the "Damascene." It is larger than any other Damson. The Bedfordshire Damson makes its appearance in Covent Garden in October; this is nearly or quite as large as the Damascene. I was much struck with the buteness and goodness of this kind, and I wrote to Leighton Buzzard for a dozen trees. They were sent. Most uncouth suckers they were. This year they are bearing fruit. Two or three are common small Damsons; the others are botanical curiosities, being versions of our wild Plum, some red, some green, but all worthless.

So much for Bedfordshire Damsons. A Damson introduced from Germany some years since is very remarkable. I have named it the Sweet Damson. It is a lump of sugar, and shrivels on the tree, it then eats like a small rich French Plum. Engene Fürst is its German name. It is, however, damsonian in habit. Another variety with downy leaves is peculiar to the valley of the Severn near Gloucester, where it "makes a fortune" for the growers. It is a variety of the Violet Plum, but ripens a fortnight or more after the Early Violet. I have named this the Summer Damson; it is excellent for tarts and puddings, as are all the tribe. Lastly, we have the White Damson, a very old sort. There are several varieties of this; the best among them gives handsome yellow fruit, and is really good. A tree trained to a S.W. wall in my son's garden gives fruit as large as moderate-sized Green Gages, and he says they are as good, having a charming, unkillable, yet agreeable acidity.—THOS. RIVERS.

GERANIUMS AND OTHER BEDDING PLANTS IN 1870.

THE season being far advanced, I send a few notes on bedding plants as grown here, trusting they will be found useful by those who, like myself, have little space for wintering bedding plants, and yet have a great number of beds to fill.

By way of preface, I must state that I do not wait for any particular time after July comes in for putting in cuttings of Geraniums. I take them off as early as possible, as by doing so the beds present a more uniform appearance during the growing season; and should I not have put in sufficient cuttings by the third week of August, I find it an easy matter to secure a great number without spoiling the appearance of the beds. On the other hand, by letting the plants grow at will till August, and putting in the cuttings at once, both the neatness of the beds and the flowers are spoilt. Cuttings inserted in beds out of doors require but little attention, and make bushy plants with plenty of hard wood. Syringing at night is all the care they need, and though they will flag in the bright sunshine, do not shade them, nor give them water.

I will now begin with the different Variegated Geraniums. The first on my list is Luna, a bronze; it is a really splendid bedding plant when used in a bed or mass by itself. By no other Geranium is the same effect produced, and unlike most of the Variegated or Tricolor kinds, it is not necessary to take off the flowers. I do not like it in ribbon borders, except when planted in a double row. Too much cannot be said in praise of this variety; it is a Geranium that can be kept through the winter well, being as hardy, or nearly so, as Tom Thumb. This quality is a great consideration, and though the leaves become nearly green during the dark months, they regain their beautiful colours in spring, or sooner if placed in gentle heat. Luna is also very readily propagated either in autumn or spring. My mode of doing so is to take up the old plants in October, pot them in moderately rich compost, leaving the tops on, and to place them in January or February in an early vinery. As soon as they are fairly growing I take off the tops. Luna is but a moderate grower, but very compact. A few cuttings inserted in thumb-pots in August, kept growing throughout the winter, and potted in 4-inch pots in February, make useful decorative plants for the conservatory. Beauty of Oulton must give way to Luna both for foliage and flowers, but is useful as a pot plant.

Mrs. Pollock, a well-known Golden Tricolor variety, is undoubtedly good, but the flowers should never be allowed to remain, as I consider the beautiful markings of the leaves are lost when the blossoms are preserved. To prove this I ask any of your correspondents who are growing Mrs. Pollock to allow the plants of one bed to flower, to pull the flowers off the other, and to note the difference. This is an excellent bedding plant, of much quicker growth than Luna, and inclined to be loose in habit, though this defect is remedied by taking the long shoots off, and putting them in as cuttings. It requires a little heat and but little water, in fact the less the better, to keep it through the winter. I find autumn-struck cuttings keep better than the old plants, and are less troublesome. Sunset is but a poor bedder, though useful for pot-culture.

Cloth of Gold has done well with me, but I have decided to discard it, and replace it with Crystal Palace Gem. The latter is a decided acquisition, the foliage being good and the flowers and habit better. A bed of it is very striking, the rose-coloured flowers showing it off to perfection. It should be kept rather

dry during the winter, and is apt to become nearly green unless it is in a warm atmosphere.

I now come to a different section—the Silver Variegated, of which Flower of Spring shall be the first noticed. This is really a first-class variety both in respect to its habit, which is unsurpassed, and its flowers, which are fine. It may be classed with Luna for keeping in the winter; it is also readily propagated in spring, and I find cuttings struck then do as well as, or better than, autumn-struck cuttings or old plants. Bijon, which has been useful in its time, has seen its day with me; it has a good silver variegation, but the habit is wretched. Flower of the Day, a good old variety, is still useful, though inferior to Flower of Spring.

Italia Unita is a lovely variety. Too much cannot be said in praise of it. The habit is unique, and the colour of the leaves beautiful; it blooms freely, and the flowers are good. It should be planted rather thickly, so as to make a display at once, for it is a rather slow grower. It is also a good kind for keeping through the winter, either as cuttings or old plants. The old plants, lifted in October, potted in light rich soil, and kept growing steadily during the winter, make a grand show for the conservatory in March or April, and can then be hardened-off and planted-out as usual.

Countess of Warwick is good for pot-culture, but makes too much growth with me to be useful for bedding. Lady Plymouth is still a favourite of mine, though it is difficult to keep it in winter, the autumn-struck cuttings doing best. It is useful for mixing in bouquets, and is very fragrant. Mangles's Variegated, though old, is still unequalled as an edging plant, and its treatment is very simple. In October I lift a few old plants, place them in small pots, and keep them rather dry during the winter; early in the year I place them in an early vinery, they afford abundance of cuttings, and spring-struck cuttings of this variety are better marked than old plants and autumn-struck cuttings. Attention must be paid to pegging it down, otherwise it soon grows out of bounds, being of very free growth.

I now come to the Nosegays, of which Stella stands undoubtedly first as regards its flowers, the trusses of which are enormous, its habit, its foliage, and its hardiness. It is easy of propagation, but this should be done in the autumn. It is so well known that I need say no more respecting it. With respect to Lady Constance Grosvenor, I must wait till another season before I say much of its qualifications, though so far there is nothing to say against it. Lord Palmerston, another well-known variety, though rather loose in its truss, is still worth growing, and is one of the best for pot culture.

Of the Zonals, I will first notice an old variety, and a favourite with me—Ivery's Masterpiece, which I have not seen grown for some years. I consider it very effective in foliage, and the white flower stems with good trusses of light scarlet flowers are very showy. I hope to have a good stock of it by May, having now about a hundred rooted cuttings ready for potting. The wood being very soft, it must be kept rather dry during the winter. Autumn-struck cuttings potted as soon as rooted make useful decorative plants for the conservatory. It is very early-flowering. No manure should be used where it is intended to plant this kind.

Beauty of Calderdale I believe will be the best of its class, but I will wait till another season before I say much about it. Madame Vaucher does well here in light soil. It is one of the first to bloom in spring if kept in small pots; it is, therefore, useful for the greenhouse or conservatory. Mrs. William Paul is an excellent variety for pots, but of much value for bedding. Of Rose Rendster I must say the same. Roi d'Italie is good, but to keep it bushy it should have the tops pinched off early in summer; it is free-blooming, and very effective. William Underwood is good, though inclined to make more wood than flowers. The same holds true of Dr. Lindley and Clipper, each of which is good for pot culture. Christine is still useful; in fact, I have not seen anything to equal it for blooming, though it requires constant attention in picking, as it soon becomes seedy. The cuttings should not be put in later than August, and should be potted as soon as rooted, and have every attention to keep them from damping. Trentham Rose is another good old variety, very free-blooming, of a good colour and good habit. This is a good, useful variety, and requires about the same treatment as Christine in the winter. Tom Thumb, though good, is too well known to need comment. Little David I like; it is swifter than Tom Thumb, as free in blooming, and is readily known by its white eye.

In concluding my remarks on Geraniums, I must say that

with me they are favourites, and it will be some time before they can be surpassed, especially the Bronze, Tricolor, Bicolor, and Silver Variegated, kinds of which the foliage is a show without mentioning the flowers.

I now pass to some other good bedding plants. The first shall be *Lobelia speciosa*, which still holds the sway as a dwarf blue-flowering plant; it comes in flower early, and is the last to go out of bloom. Its treatment is very simple. In October I lift a few plants from self-sown seeds, of which there are plenty in the beds, prick them out in square pans, keep them from frost during winter, and place them in gentle heat; it is then propagated as freely as a weed. This method is preferable to sowing seed in spring.

Calceolaria Aurea floribunda, and Prince of Orange, are both useful and effective plants; the latter is more liable to damp-off in winter than the former, but care should be taken to keep the cuttings dry when put in, shutting them up closely in the day for the first week to prevent their flagging, and giving ventilation at night.

Ageratum mexicanum is also good where there is room for it. A pan of cuttings put in during this month, and kept from frost, will afford plenty of cuttings in spring. The same remark is true of *Gazania splendens*, which still holds a place in my garden, though it closes its blooms in rainy or cloudy weather. *Viola cornuta* Perfection is very fine with me, though my stock is limited; still I hope to have a good quantity of it for next season. So far nothing has approached it in beauty, excepting *Lobelia speciosa*, and even that is not equal to it, the blooms of Perfection being large and of a good colour, it is also very constant in blooming. I consider this plant well named, *Viola lutea grandiflora* has done well here; it is very dwarf, and bears an abundance of yellow flowers. I think a bed of it will look well.

Iresine Lindenii is with me another gem; the colour is splendid, and it withstands the hot, dry weather without flinching. This will prove the best coloured plant grown. *Iresine Herbstii* I have thrown away; it is not to be compared with *I. Lindenii*, though it is useful for pots and baskets. *Dactylis glomerata variegata* is a good edging plant, and is easily propagated, for the old plants can be kept in a very small space in the winter, and in spring can be divided by dozens. It will also stand the winter if left in the ground. *Abutilon Thompsonii* is very showy, and is likely to do well bedded here. *Sedum sempervirens* is a neat, compact plant for small beds or rockeries, but it will be some time before it and *Echeveria metallica* be established as favourites. *Pyrethrum Golden Feather* has only been moderately good with me, but I think it is owing to my treatment of it. I put in cuttings of it in October with the *Calceolarias*, and the consequence is they have nearly all flowered, which spoils it.

Coming now to hardier plants, *Arabis variegata* is a good plant for edgings, but the flowers should be pinched out as soon as seen. *Cerastium tomentosum* is still good, but requires to be divided in spring; if left more than a year without replanting it becomes very rough, and is not like the same plant. *Pentstemon magnificum* is a good hardy blue-flowering plant in a mixed garden or for borders.

I have now given the names and the winter treatment of the bedding plants which succeed well at this place, three miles from Manchester. I have purposely avoided annuals, as I consider them out of place in the flower garden proper, though extremely useful for borders and clumps; still *Saponaria colorata* sown in pans or boxes in spring, pricked out as soon as the plants can be handled, and well hardened-off, is very useful and neat.

In conclusion, I would say there is nothing like striking *Geraniums* early and potting when ready, half a dozen well-established plants being worth a score of weak, sickly cuttings placed in boxes and kept anywhere but in the right place. Speaking from my own practice, cuttings should all be in, at the latest, in August, and potted-off in September. Everything should be well hardened-off by the middle of May at the latest, and then planted out, the hardening off the plants simply meaning the well-being of the flower garden for the summer.—STEPHEN CASTLE, *The Gardens, Bent Hill, Prestwich.*

RED BEET FOR A FLOWER GARDEN.

Mr. GORTO must have made the mistake of not getting the right sort of Beet. I purchased a packet of seed from Messrs. Osborn, of Fullam, sowed it on a gentle hotbed, and pricked

out a hundred plants in a border. The effect has been all that could be wished; every plant has come true to its colour, and has remained about 10 inches high in my rich soil. I have *Coleus*, *Iresine*, *Amaranthus*, and *Perilla* planted out, but Osborn's Select Red Beet has far surpassed them in every respect; in future it will be a regular bedding plant with me. Its effect in a bed with *Centaurea candidissima* is superb.—STIFF SOIL.

BEDDING PLANTS IN THE NORTH OF ENGLAND—LAWN MOWERS.

I SEND you a few notes of how bedding plants have done here this hot summer, as such notes from others are always useful to me.

Of *Geraniums*, Waltham Seedling surpasses anything else among the scarlets, and is all that could be wished. *Christine* is also beautiful in its colour. I have tried Lord Derby, but the caterpillars are too fond of it, and damage it to its destruction. I have likewise tried the Double Tom Thumb, but it does not bloom freely enough, and is not effective in colour. Gold and Bronze *Geraniums* have been much greener than last year; they do better with plenty of moisture. *Gloire de Nancy* is of no use out of doors, even as a centie; it runs to leaf, and the trusses become small. *Verbenas* have succeeded better without water, and were most beautiful when it was hottest. *Lobelia* is a short-lived flower, and if plants are forward enough to bloom in June, they are out of bloom at the end of August. *Calceolarias* have been a failure this year, except where well watered. I think they cannot have too much water. *Iresine Lindenii* looks beautiful when well watered, and edged with Golden Feather *Pyrethrum*, as it is here. *Echeveria metallica* is not effective when mixed with such as the above.

May I add a word about lawn mowers, from a theoretical point of view? It appears obvious that a machine which makes few cuts per yard must necessarily rib the grass more than one which makes many; the only question (which is a practical one) is, whether the ribbing of any particular machine is sufficient to be objectionable. Second, that such a machine must be easier to work, as it does less; the only question is, whether the other is too hard to work when the grass is short. Third, that a machine with many knives must necessarily be able to cut the grass shorter, and by hard work it is able to cut it when long. The conclusion from these considerations is, that the old machines alone can bring a lawn to the highest state of finish, such as is required for croquet, while the new must be a great boon to those who have a large space to keep in order, and where the close-cutting of the old machines would be thrown away. So in a large establishment both may be indispensable, since neither can do satisfactorily the work of the other.—J. F. B., *York.*

METROPOLITAN FLORAL SOCIETY—CHAIRMAN'S FLOWER CASES.

HAVING seen the report of the first show of the Metropolitan Floral Society, I, for one, shall be most happy to aid the Rev. H. H. Dombain in his praiseworthy efforts to encourage the cultivation of the pets of my childhood, supposing that those gems of the old-fashioned country and cottage gardens will be permitted a place in the metropolitan shows. I refer to the spring flowers—Pansies, Ranunculuses, the gay and brilliant Anemones, and the lovely Auriculars. As we hope to have the support of our country cousins in this good work, I must remind them that distance, or fear of their pets being injured in transit or flagging from want of natural provision (water), is now a secondary consideration, for by the introduction of Chapman's patent case flowers may be sent hundreds of miles without being injured. To prove what I say is correct, I, as an amateur of very humble pretensions, sent from this place (Gloucester) to the Worcester-shire Show, held at Kidderminster on the 30th of last month, in one of these patent cases six bunches of flowers, and on their return on Monday morning the 5th inst., finding them in such good preservation, sent through a friend to the Crystal Palace Show on the 6th of this month, where they remained the three days, and look well this morning after having been in the case ten days, and travelled above three hundred miles! I suppose an advertisement of the Society will soon appear. When it does I shall be happy to subscribe my mite, and do all I can to induce others to follow my example; for, depend

upon it, those who spend their leisure hours in the cultivation of flowers will have their minds guided to higher thoughts, and set a good example to all around them.—L. W.

MANDEVILLA SUAVEOLENS HARDY.

LOVERS of this most beautiful and useful plant should more frequently try to grow it out of doors. I believe that with care, and good judgment in selecting a proper position, it will thrive in many parts of England. I have this summer seen it growing at three or four different places that I have visited; but just before I left Lillesden I called upon my friend Mr. Jack, of Battle Abbey, in Sussex, and among the many choice things he showed me was a large plant of the Mandevilla growing against the walls of the old Abbey. It was so luxuriant, and flowering so freely, as to quite surprise me; the foliage was very large and healthy, which is very different from the state in which it is many times found when the plant is under glass; the flowers were fine and white, and the clusters large. If my memory does not deceive me, there were two plants growing against the wall. The larger one was planted about twelve years ago, and it covered many square feet of the old abbey wall; the smaller plant was a seedling raised from the old one, and was planted by Mr. Jack about seven years ago; it, too, was in a perfectly healthy condition, and flowering freely. Both plants, Mr. Jack told me, withstood last winter's frost uninjured without the protecting material that was usually put over the plants. Perhaps they were a little sheltered from the cold and cutting winds by the large stone buttresses that stand at regular intervals along the front of the Abbey, but even these were no defence against last winter's frost; and the particularly healthy appearance of the plants, after what some would call an unnatural treatment, I thought was not only worth notice as an unusual circumstance, but also as suggestive of the question whether we give the plant its proper treatment under glass. Except in a few places, I have seldom seen a healthy plant growing under such protection; red spider and thrips appear to be its greatest enemies, especially if the roots are confined in too small a space, in which case the plants seldom thrive or flower satisfactorily; and as to growing plants in pots, I have never found it worth trying—the growth the plants make is not strong enough to produce more than three or four flowers where there ought to be large clusters. In my opinion the Mandevilla wants plenty of rooting space in a well-drained, deep, rich soil, abundance of water when growing, both at the root and overhead, care to thin out the shoots when growing, and, finally, every means to be adopted to well ripen the wood before the leaves fall.

There are adorning the Abbey walls many other choice plants which are not commonly met with elsewhere in such positions; the vigorous growth and free flowering of most are remarkable. The early maturation of the wood is apparent, also that the roots are in a comfortable medium. The latter condition is no doubt in a great measure owing to the immense quantity of soil brought there to form the upper terrace, which is well drained, and to the great depth and age of the material forming the foundations of the Abbey, and which the roots of the plants are induced to penetrate.—THOMAS RECORD, *Hatfield Gardens.*

A STANDARD EARLY YORK PEACH.

On the 8th of September I gathered the last of thirty-one Peaches from a small pyramid tree that has been standing without any protection throughout the winter and spring: they were rather small, but of excellent flavour and perfectly ripe. I should mention that the variety is the Early York. About fifteen days prior to this I gathered the fruit of Rivers's Early York from a tree against an oak fence, so there was not much difference in the ripening as regards protection, Rivers's variety being said to be about ten days earlier. I know that this is not the first time the above Peach has ripened its fruit without a wall or protection, but I thought I would call attention to it, as others might like to try a bush or a pyramid where they had little or no wall to spare.—HARRISON WEBB, *Weirleigh, Kent.*

ROYAL HORTICULTURAL SOCIETY.

We noticed in our last issue that the Society had resolved to hold its country exhibition in 1871 at Nottingham. On Thursday, September 1st, a supplementary meeting to that reported by us at page 159 was held in the Mayor's parlour

at Nottingham to consider certain important details and arrangements. Amongst those present were Mr. E. J. Lowe, Mr. Pearson, of Chilwell, and Mr. Ingram, of Belvoir Castle Gardens. From the thoroughly earnest manner of all present, and the announcement of the numerous promises already made of liberal sums towards a guarantee fund, it is very probable that a most successful provincial exhibition will at length be held by the Royal Horticultural Society.

THE METROPOLITAN FLORAL SOCIETY'S FIRST SHOW.

ALTHOUGH your reporter has already given a full report of this wonderful exhibition, yet I cannot allow it to pass without recording a few observations which have struck me as connected with it.

1. It proves conclusively that the race of florists is not dead or buried under the superincumbent mass of bedding-out plants, or sick at heart through the unworthy attacks of those who are now far too magnificent to allow themselves to be styled florists. Never had a more unfavourable season been experienced by florists. The long-continued drought had not only made it indeed a labour of love to attend to the wants of their flowers, but it had so forced prematurely into bloom many such as the Hollyhock and Gladiolus, that some advised we should postpone the show for a year, as it was not possible that we could obtain flowers; yet, withal, the skill and perseverance of the poor despised florist conquered all difficulties. It required no small amount of constant care and attention, watering, shading, &c.; but florists are a hard-working race, they take pride in their pets, and the result was the grandest show of cut flowers ever held.

2. It shows the great advance that has been imperceptibly made in the quality of florists' flowers. In talking about the show to many people before it was held one gentleman remarked, "The Dahlias—ah! there's nothing to be done with that; you can't improve upon it." Yet I venture to say such stands of flowers as were shown at the Palace were never exhibited before. We sometimes look back on the past, all with the old feeling, *laudator temporis acti*, and think that no days were like those; but could we conjure up a stand of forty-eight Dahlias such as used to be shown at the Surrey Gardens in days gone by, and place them alongside of those Mr. Keynes or Mr. May exhibited last week, I venture to say horror would seize us to think we could ever have praised those older flowers. The Gladiolus, too, was unknown then save in a few now-discarded flowers, and what a gorgeous addition they are to an autumn show! How magnificent the spikes of Mr. Kewey and Messrs. Stuart & Mein! Hollyhocks, too, thanks to Mr. Chater, Messrs. Downie, Laird, & Lang, Mr. Hawke, and others, are as different from the flowers of those days as light from darkness; and although we have been running rather too much on light and undecided colours, yet some magnificent scarlets and dark flowers were exhibited the other day. My experience goes back now through a good many years. I have visited many autumn shows, and I unhesitatingly declare that such a show was never before held in or near the metropolis.

3. It shows clearly that if prizes are offered, good in amount and reasonably adjusted, you will induce competitors to come forward from all parts. By "reasonably adjusted" I mean giving small growers a chance—not putting the nurseryman who has his hundred acres on a par with the man who has only a dozen, or the amateur who grows fifty or a hundred Dahlias with one who grows three or four times the number. In proof of this let me say that the entries were over two hundred; that the best twenty-four Gladiolus came all the way from Kelso, and the best twelve Asters from Shoreditch, two very opposite localities. And that the Show was all I have stated may be gathered from the following comparative table—

Exhibition of 1870.	Last Autumn Show at Crystal Palace.
Dahlias 85 entries 24 entries.
Asters 33 6
Hollyhocks 18 5
Verbenas 8 2
Gladiolus 12 5

This, I think, conclusive; and as to quality, the opinion has been very decidedly expressed by all who visited the Show, that it was really wonderful.

And now as to our future. I cannot but look forward hopefully; and for the success that has been attained I have to thank many kind friends. The Judges, who were the very best that could be obtained, gave their services gratuitously, and

worked with a hearty good will; the exhibitors were courteous and thankful for the exertions made, and were neither the rogues nor simpletons some have tried to paint them; and I need not add that my friend Mr. Wilkinson gave every aid that courtesy and kindly feeling could do. The assistants at the Palace worked with a hearty good will; and from first to last there was not one hitch—save one, and that we had no control over—the dinner was not what it ought to have been; at this we gumbled, and rightly. Our Committee is formed; and when I saw it include such honoured names as Turner, Keynes, Hughes, Peach, Holmes, Fraser, Cutbush, &c., I have no fear of a successful course. Already one gentleman has promised special prizes for new Dahlias, others have doubled their subscriptions, new members have been added, and I think the florists will show that they can keep alive a Society which they have thus happily inaugurated.—D., Deal.

RUNNERS FROM BARREN STRAWBERRIES.

AMONGST the various articles on Strawberry culture in your Journal, those on non-productiveness of runners taken from sterile plants have particularly interested me, and from a series of experiments carried on during several years I am satisfied that now the best and strongest runners have been sacrificed to a theory quite at variance with facts. I give you a table of my trial in 1869—70, and this was carried on under my own inspection; every plant from which runners were taken I marked myself. The parent plants which were barren in 1869 and which were fruited in 1870 are marked with an asterisk (*).

In 1870.

President.....	144	runners 11	barren.	Mostly barren.
Premier	96	" 8	barren.	Several barren.
*Turner's Seedling	24	" none	barren.	All old plants fruited.
*Vicomtesse Horti-	48	" none	barren.	"

—J. L. THOMAS, *The Cottage, Macclesfield.*

EARLY GARDEN PRODUCE FROM CORNWALL.

VERY few persons are aware of the earliness and value of some of the garden produce from South Cornwall. Many times we have heard the first early Potatoes in Covent Garden Market stigmatised as "stale foreign things," when we knew the very plot of ground beyond Penzance from which those Potatoes had been dug not twenty-four hours before. The following interesting statement was recently made by Mr. Dentigh, of the West Cornwall Railway:—The average despatch of Potatoes from the railway station for the past eight years has been 2337 tons per year, and of Broccoli 2627. The largest despatch of Potatoes was in 1863—3116 tons; and of Broccoli, 1868 3571 tons; the smallest—Potatoes, 1868, 1418 tons; Broccoli, 1867, 1544 tons. For the last season the quantities were respectively—Potatoes, 2591 tons; Broccoli, 2574. These crops are very similar in amount, for the successful cultivation of the Broccoli largely depends upon the land being previously occupied by the Potato. Mr. Thomas had given him the following figures:—

	Acres.	Wages.	Average Value per acre.	Total Value.
Broccoli	500	£2000	40	£20,000
Potatoes	509	45 0	50	25,000
Raspberries	10	80	40	400
Gooseberries	50	400	80	1500
Black Currants	25	200	85	875
Asparagus	7	20	60	420
Onions	80	800	40	3200
		£8000		£41,335

PLANTS FLOWERING IN AUGUST.

August 3. <i>Dracopcephalum speciosum</i> <i>noobilavicum</i> <i>Malva Mireni</i> <i>Achillea tomentosa</i> <i>serata</i> <i>macrophylla</i> <i>compacta</i> <i>Echinops Nitro</i> <i>Scdum Telephium</i> <i>Sieboldii</i> <i>variegata</i> <i>spectabilis</i> <i>Schizanthus coccinea</i> <i>Calystegia pubescens</i> <i>Hieracium Pilosella</i> <i>alpinum</i> <i>aurantiacum</i> <i>Physalis Alkekengi</i> <i>Plumbago capensis</i> <i>Cupilea platycentra</i> <i>Coletia Fesca</i>	August 3. <i>Yucca filamentosa</i> <i>gloriosa</i> <i>Acerodilium roseum</i> <i>Mitrantheca coccinea</i> " 6. <i>Lythrum Salicaria</i> <i>roseum superbum</i> <i>Datura Stramonium</i> <i>Nigella hispanica</i> <i>Helichrysum monstrosum</i> <i>Mesembryanthemum tri-</i> <i>color</i> <i>glabrum</i> <i>Pentstemon ovatum</i> <i>Scoulerii</i> <i>venustum</i> <i>procerrum</i> <i>glabrum</i> <i>Enjans manus</i> <i>metabalis</i> <i>Linum petraeum</i> <i>alpinum</i>
